Now had the doors been closer together, so that when the men entered the silo their heads were above the opening, they would not have experienced any difficulty.

Had the night been windy so as to have produced more draft in the silo, it is not likely that the accident would have occurred.

Had these men not entered the silo until after the machine had started, and the silage had begun to fall, the accident would not have occurred, because in a very few minutes the stirring of the air would have so much diluted the carbonic acid gas, that no inconvenience would have been experienced.

It is also probable, too, that had the men been of sound mind and vigorous, the accident would not have occurred, as they would have realized the difficulty quickly enough to have saved themselves.

The lesson to learn from this sad accident is, that when a silo is being filled the machinery should be started before the men enter the silo, after it has been left standing for some hours, unless an open door is so near the silage that a man's head is above it.

The carbonic acid gas is not a poison, but in it a man will drown as he does in water, and care must always be exercised in sending children and incompetent people into a freshly filled silo or one that is being filled, if it has stood some time under conditions where the person's head would come below an open door.

The danger largely disappears a few days after filling in a good silo, because as soon as the cells of the plant are dead, the respiration stops, and the carbonic acid gas is no longer rapidly generated. F. H. KING.

Coming Events.

Georgia Dairymen's Association, Grantville, Ga., Oct. 12, 13, 1899.

THE annual circular of the Wisconsin Dairy School, located at Madison, Wis., is now being distributed. The class of last winter was the largest in the history of the school. There were four graduate students, eight who took the course for the second time, and 114 first year students, making a total of 122 butter and cheese makers in the class of 1899.

The next term of the school begins Dec. 5, 1899, and closes Feb. 22, 1900. The estimated average expenses of a student is fifty-seven dollars for the term. The number already registered is nearly twice as many as one year ago at this time, which suggests the necessity for early application in order to secure admission.

WAS IT A FOOL ANSWER?

In its issue of September 2, 1899, The Denver *Field and Farm* published the following:

The following fool answer is given by HOARD'S DAIRYMAN to an inquirer living at Montclair, Colorado, and it would seem that such a paper should have known better about which it tried to advise:

"First of all, buy a feed cutter and power to operate it, for the purpose of chaffing a part of your alfalfa hay to mix with corn chop. The daily allowance for each cow, graduated to her capacity for digestion, assimilation and converting the feed into milk, should be from twenty to thirty pounds of hay and six to ten pounds of the corn chop. We should aim to feed approximately half of this hay chaffed and mixed with the grain, and would try chaffing it twelve to thirty-six hours before feeding, adding enough water to the mass to cause it to heat and soften. We cannot say how long this heating mass would keep without injury. This will vary somewhat with the weather and surroundings and can only be determined by experience. In the absence of arrangements for chaffing some of the hay, bran must be mixed with the corn chop to extend it so that it can be better digested. Use equal parts by weight."

The editors of HOARD'S DAIRYMAN are as anxious to learn as any one can possibly be, and they realize so fully that what they know is but little when compared with what they do not know, that they are willing to be taught from any source and are not over particular whether the instruction comes in courteous form, if it is founded on facts. It will be observed that the *Field and Farm* did not indicate in what respect our answer was misleading or unwise, and accordingly we wrote for such information and received the following reply:

We object to the idea of buying a feed cutter for the reason that such implements are utterly unknown here and must be rated as an unnecessary burden and expense, especially in the way of labor. In the second place the only way that alfalfa hay can be fed, is direct from the stack with as little handling as possible. It could not be fed through a feed cutter without loss of leaves, which is the best part of the plant. The soaked chaff as you mention it, would ferment inside of thirty-six hours and taint the milk. We tried the experiment fifteen years ago and know all about it. This is the reason alfalfa cannot be siloed. Wet alfalfa has the taste and smell of very rank wetted tobacco leaves and is about as appetizing to a cow as such forage would be.

If these objections are sound we ought to withdraw the advice given and apologize for giving it, for it is a matter of considerable importance to dairymen in alfalfa regions to know the best methods of feeding it and what to feed in connection with it. Alfalfa is a splendid forage plant, but like many other forage plants, does not of itself furnish a complete and properly balanced ration. Moreover, it is a very bulky food and a cow in full flow of milk, could hardly eat enough of it to furnish the necessary solids for that amount of milk. It is therefore expedient to supplement alfalfa and all other kinds of roughage with feeds much more concentrated.

The tables of digestible nutrients in feed stuffs, show that ground corn is admirably adapted for this purpose in connection with alfalfa; but ground corn is much too concentrated for safe or profitable feeding by itself. To secure best results it must be extended with some lighter and more bulky material. Bran may be used for this purpose; or any long forage, if so finely "chaffed" that it will mix with the ground corn, will serve a similar purpose, and the circumstance that feed cutters are utterly unknown in Colorado (if such is the fact) can hardly be said to be a good reason for not recommending them for this or any other use to which they are adapted.

The further objection that they are an "unnecessary burden and expense" will depend altogether upon the relative prices of the alfalfa hay and bran. In the inquiry to which our answer was made, alfalfa hay is quoted at $6 per ton, and bran at $16. If, therefore, the hay can be had and chaffed at less expense than the bran can be bought for, there will be economy and not unnecessary burden or expense in using a feed cutter,—a proposition too plain for argument.

Moreover, if in the handling and cutting, the leaves become detached from the stems, they are not necessarily lost. We have practiced for years running common clover through a feed cutter, and are convinced that it pays to do this. Of course, many of the leaves are broken off, but they all go in with the rest of the cut fodder and are not lost. We often mix this cut clover with silage for twelve to twenty-four hours before feeding, with the result that the dry and woody stems of the plant are moistened and softened, and thereby made more palatable and are eaten.

It will be observed also that our advice about wetting the chaffed alfalfa was purely tentative and suggested for trial as an experiment. This is in accord with our universal custom in cases where we are not quite sure that we are right, and we are not fully convinced yet that such an experiment would not prove satisfactory now, however it might have turned out fifteen years ago. Despite the positive assurance of the *Field and Farm*, that alfalfa cannot be siloed, it has been conclusively demonstrated in recent years, not only that it can be successfully siloed, but that butter made from cows that were eating two-year-old alfalfa silage, *ad libitum*, scored ninety-eight and three fourths points, and was awarded the sweepstakes gold medal at the California State Fair, two years ago.

Let us say in conclusion that we try at all times to discard all foolish pride of opinion, and shall be ready in this instance, as in any other, to conform to well authenticated facts. If the friend in Colorado tries the plan of feeding suggested, or any other of our readers can contribute any facts throwing light upon this problem, we shall be glad to hear from them.

AN IGNORANT TEACHER.

The fact is that science has got the better of the cow. Butter is nothing more than the food eaten by the cow, subjected to certain internal processes and precipitated into the milk, from which it is extracted in the form of fat. In a margarine factory the same result is effected, and the fat of cows and oxen is converted into butter without the intervention of the cow. The component parts of margarine and butter are precisely the same, with the exception of the former not containing the volatile, tasteless and unnutritious butterine.—*London Truth.*

The editor of a daily paper, like Bacon, takes all knowledge for his province, but once in a while his machinery slips a cog, as in the above clipping. If we only knew how the food is "precipitated into the milk in the form of fat," and if also we had the knowledge that butterine is the same as butter—except, it would be a long step forward. The last five words of the article we heartily endorse, although we have suspicions that the editor didn't mean it that way.

However, in the general hash which Labouchere has made of the subject, there are several statements which should not be allowed to pass unchallenged.

One is that in a margarine factory the same results are obtained as in the cow's udder. It needs but a slight knowledge of physiology to know that chemical analysis does not always, or even frequently, tell all there is to be known regarding products of the animal body. The reagents take no cognizance of the power that may exist in the enzymes, digestive fluids and glandular secretions nor of the nutritive value of the various fats found in butter.

There is no doubt that milk that has been heated, has an entirely different nutritive value from the same substance fresh from the cow, and the same is true of other animal compounds.

Contrary to the opinion above expressed, butyrine (not butterine) has a decided nutritive value and it probably occupies a position in the animal economy that cannot be taken by the more difficultly soluble fats found in butterine or oleo. In his book on Foods Prof. Bell writes as follows: "When the highly complex and peculiar character of the constitution of butter is considered and that it is the fat derived from or natural to milk, which for a time at least is the principal food of the young, it is probable that butter performs some more specific office in the system than ordinary fats."

The chemist has his limitations and when he assumes to invade the domain of physiology, of digestion and nutrition, his analyses taken by themselves are absolutely worthless and the dictum of an editor based on such premises, becomes dangerous because of the effect it may have on the wide class he appeals too.

The International Congresses of the Exposition of 1900.

Congress of the Rational Alimentation of Cattle.

An international congress on questions concerning the rational alimentation (feeding) of cattle has been organized by the French Society of that name, under government patronage, for the exposition of 1900. The meetings will take place during the three days beginning June 21, following immediately after the congresses of agricultural teaching and agronomic stations, and preceding by a single week the great congress of agriculture. The present congress appeals to agriculturists and specialists of all countries, in order that results already acquired may be submitted for examination.

The membership card is ten francs for French members; foreign delegates are admitted free, unless they desire to receive the publications of the congress. Only members of the congress can take active part in the work of the congress.

Reports on the following questions are already under preparation; documents and communications concerning these questions are earnestly solicited from other countries. All such communications should be in the hands of the committee of organization by the first of March, 1900:

1. Substitutes for milk in the food of calves, whether to be reared or butchered. Reporters, M. Gouin, corresponding member of the National Society of Agriculture, proprieter and breeder; Dr. Saint Yves Menard, Director of the vaccination service of the city of Paris.

2. Influence of food on the fatty matters in milk. M. Dechambre, Professor in the National School of Agriculture, at Grignon.

3. Part played by saccharine matters in nutrition; use of molasses and sugar in the food of cattle. M. Grandeau, Inspector General of Agronomic Stations.

4. Importance of the relative proportions of nitrogenous and non-nitrogenous matter in the rations of working animals. M. Lavard, Delegate Administrator of the Omnibus Company, Paris.

5. Sale and purchase of food according to analysis; supervision of foods. M. A. Ch. Girard, Professor at the National Agronomic Institute.

6. Ensilage. M. Jules Le Conte of the Cour de Comptes, proprieter and breeder.

7. Drying methods applicable to the preservation of food substances rich in water, (beets, potatoes, green fodder, etc.,) M. Grandeau.

Communications concerning the congress should be addressed to the Secretary-Treasurer, M. Gallo, 69 rue de la Victoire, Paris. The American members of the Comite de Patronage are, Messrs. W. O. Atwater, Director of the Storrs Agricultural Experiment Station, Storrs, Connecticut; W. A. Henry, Madison, Wisconsin, and C. D. Woods, Orono, Maine.

Various Virginia Queries.

Does Sorghum Decrease Milk Flow?—How to Increase the Milk Flow.—Feeding Problems.

ED. HOARD'S DAIRYMAN:—I would like to have you answer a few questions for me. Before taking your paper I bought some very poor cows and it is a puzzle to me to know what to do with them. I cannot sell them for milk cows, as some barely give me a gallon a day, and I can't sell them for beef, as they refuse to take on fat.

They have a good pasture to run in and in addition I feed them about ten pounds of mammoth clover, mixed with wheat bran. Since taking your paper I have tried to get better stock and now have some Jerseys and five registered Holsteins—one very good Jersey bull and one registered Holstein bull. However, with all my pains in selecting and care of stock, they are way below the standard in their flow of milk.

Now, I want to know what you would advise me to do with my first cows to get them fat and what to do with the better ones to get an increase of milk.

Please give me some idea what amount of milk I should get from forty head of good Jersey cows (not like I have, but what I expect to be able to have some day). Besides the pasturing the cows have, I feed wheat bran, hay and green sorghum to them twice a day. One of my milkers attributes the decrease in flow of milk to the soiling with sorghum. Can that be the cause?

I will soon be able to soil cow peas and fodder corn and I am in hopes that will do better.

Taking the advice of your paper I purchased a round silo and am now busy setting it up, and expect to commence filling it as soon as completed. If it does what is claimed by all users, I shall put up two more nex spring, in order to be able to feed cattle

through the hot summer when the pastures are too dry for pasturing.

Please formulate a balanced ration from the following feeds obtainable here: Wheat bran, $16; corn and oat chop, $18; cotton seed meal, $24; corn and cob meal on farm, mammoth clover on farm.

Also one with ensllage. NOVICE.

Lynchburg, Va.

We do not know what better to do with those "very poor cows" than to increase the feed—particularly the corn and cob meal. A pound or two of cotton seed meal per day may be added.

We are quite certain the green sorghum did not cause the shrinkage in milk, unless it be that not enough of it was fed. It should not be forgotten when feeding green fodder of any kind that nearly or quite four-fifths of it is water. Neither does ten pounds of "mammoth clover mixed with bran" afford over much material from which the cow can make milk. The Arkansas blacksmith said: "I can't live on wind and work too." Neither can the cow give milk unless she is furnished the material from which to make it.

Independent of pasture, we suggest the following as not more than a profitable average allowance for cows that are in condition to yield fairly well. Some will probably need less—because they are strippers or naturally not good milkers, and others will need more, particularly if they are large cows and capable of giving more than twenty-five to thirty pounds of milk per day:

FORMULA FOR RATION.	*Dry Matter.*	*Digestible Nutrients*		
		Protein.	Carbohydrates	Ether Extract
20 lbs. mammoth clover	15.76	1.14	6.40	.38
4 lbs. bran	3.52	.50	1.54	.12
4 lbs. corn and cob meal	3.56	.25	2.52	.14
½ lb. cotton seed meal	.92	.37	.17	.09
Totals	23.76	2.26	10.63	.73

If any cow will eat more of the clover, she should have it.

When silage is available, feed from twenty to forty pounds per day, according to the supply on hand and reduce the clover by four to eight pounds.

The Drouth In New York.

The great drouth is causing enormous loss throughout the dairy and farming districts of Central and Northern New York. Pastures everywhere are baked and burned, and the farmers are already making heavy inroads in the stock of feed, which they have counted upon to carry their cattle through the winter. Ordinarily they are not called upon to use this feed until much later in the year.

Creeks are drying up, and in many places the dairymen are compelled to feed their cattle hay and to carry water long distances for them. Milk for the dairies and cheese factories is running short in a large territory, and that from which the metropolitan milk supply is obtained is seriously affected. It is expected here that the the prices of butter and cheese will be increased as a result.

INQUIRIES AND ANSWERS.

Every inquiry must be signed with the name, Post-office and state of writer. Condense the questions into plain specific inquiry. Be careful to note if your questions have not been answered in replies to others. We are glad to answer all the pertinent questions that we can concerning machinery. Look over our advertising columns and write to the advertisers.

FEEDING STANDARDS FOR MILCH COWS.

Dry matter.	DIGESTIBLE NUTRIENTS		
	Protein.	*Carbohydrates.*	*Ether extract.*
lbs.	lbs.	lbs.	lbs.
23 to 28	2.0 to 2.5	12 to 15.0	0.5 to 0.8

DRYING OFF HEIFERS.

W. Appleby, Maricopa county, Arizona, has some grade Jersey heifers, due to have second calves this fall, that are giving a good yield of milk, and wants to know whether to keep on milking them or dry them off, so as to insure a month's rest. It is considered hardly orthodox to say so, but, somehow, we can hardly escape the conviction that it is better to follow the inclination of the heifers in such cases. We have had two or three cases in our own herd, and have had other cases reported to us where quite serious results have followed the forcing-dry process. Under ordinary circumstances, it is doubtless expedient to give heifers a short rest, but where they have inherited or acquired a tendency to continuous milking, we would not interfere with it. If they will go dry readily, give them the rest; if not, feed them extra liberally and continue milking.

HUNGARIAN HAY.

I have been a subscriber of your valuable paper for the last four years, and am in need of a little information in regard to Hungarian hay as a roughness for milch cows. Clover hay is scarce in central Illinois on account of the drouth. R. W. D.

Farmer City, Ill.

Hungarian grass, if cut so early that the seed has not matured, makes excellent hay, rating about midway between clover and timothy. But if it is allowed to ripen so that the seed will shell out considerably in handling, it will be of decidedly inferior quality.

FEEDING GRAIN TO DAIRY COWS.

If I am not infringing too much on your time I should like to ask you a question in regard to feeding cows for milk, with the following feeds, all of which I have on hand; corn ensilage, gluten meal, Quaker oat feed, wheat bran, brewers dry grains, (mixing equal parts by weight), good clover and timothy hay mixed, a limited amount of alfalfa hay. Am milking seventy-five cows; milk made into butter. Two-thirds are Holstein grades, one-third grade Guernseys. Three-quarters of the cows fresh this fall. If my questions are not making you too much trouble, you will greatly oblige me by an answer.

Cazenovia, N. Y. W. M. B.

A ration based upon the following formula, as an average for the entire herd, giving a few of the largest producers more and those that are well past full flow, less, ought to be productive of good results:

FORMULA FOR RATION.	*Dry Matter.*	*Digestible Nutrients*		
		Protein.	Carbohydrates	Ether Extract
25 lbs. silage	6.60	.33	3.50	.18
12 lbs. mixed hay	10.30	.58	4.75	.19
10 lbs. mixed grain	9.10	1.66	4.13	.40
Totals	26.00	2.57	12.38	.77

The grain mixture mentioned is not well adapted for feeding with alfalfa hay, as it would produce a ration containing an unnecessary proportion of protein. A mixture of hominy chops and bran, or ground corn and bran would be better and probably cheaper.

HOMINY CHOP

Will you please tell me through your inquiry department what hominy chop is, as sold for feed? Is it a by-product? If so, how is it made? W. C.

Gilbertsville, N. Y.

Hominy chop is the by-product resulting from the manufacture of the hominy which is on sale in every well regulated grocery and finds a place upon the tables of many families and hotels. It consists of the chit or heart of the corn kernels, the outer envelope or bran and the finer particles resulting from breaking up the kernels. The corn hearts are rich in fat and low in protein, which makes the hominy chop of less value to feed with timothy hay and corn stover than with alfalfa or common clover. It is especially adapted for use with alfalfa hay.

STABLE WIDTHS.

I have a space of 24×36 feet between two barns which I wish to fill out with a stable for cows. Will there be room enough for two rows of stalls, the long way, and give sufficient room for a feeding alley in the center? F. T. F.

Orleans, Mich.

Twenty-four feet does not give sufficient width for two rows of cows. We find even thirty feet less than is desirable, and when the new stable is built it will be not less than thirty-four feet wide inside the walls. Nothing is gained by trying to pare off a fraction of cost in building house or barn, by reducing the dimensions in length, width, or heighth. We prefer to have cows face outward, and have any number of reasons for this preference, but not one of them is of any force or validity with the man who prefers to have cows stand facing each other, unless it be the circumstance that such an arrangement demands greater width for the same degree of convenience.

And still it is possible to stable two rows of cows in a space of twenty-four feet. This will allow for walks two feet wide along the walls, gutters one foot wide, platforms five feet wide (or less), mangers two feet wide, and central feeding alley four feet wide. So narrow a stable as this should not be tolerated without some adequate provision for ventilation.

In the annexed diagram, A represents the space between two of the studding and will be approximately 4″×16″ and 8 feet high.

On the outside and about eighteen inches above the ground, make an opening, b, to admit air, which will rise and enter the stable at c, which is close to the ceiling. To remove the cold and foul air, Prof. King just reverses this current, by providing a second flue, which may be an independent chute, or may be built between studding as above, only the intake is placed near the floor, and the flue should extend as high as possible.

RATIONS WITH AND WITHOUT BEET PULP.

I want to trouble you to figure out a ration for me based on a fixed feed of twenty pounds ensilage a day, timothy and clover hay mixed, ad libitum, figuring bran at $12.-25 a ton, malt sprouts the same price, and dried brewers grain at $14.75, gluten feed $16, gluten meal $20, and new process oil meal $25. The gluten feed is supposed to analyze 27% protein, fat 3%, extract matter 50%, fibre 7.25, ash 3.21. The gluten meal is guaranteed to analyze nearly 38% protein, 2% fat, extract 47%.

My object is to ask you to figure me out the most economical ration for my cows, which are Jerseys and weigh about eight hundred pounds apiece. I also want to add that I can have for the cost of hauling, which is a matter of three and one-half to four miles, all of the beet sugar pulp that I can use. This whole cost would perhaps represent $1 a ton. Please take this latter food into consideration. Cow foods are getting higher every day, which prompts me to ask you these questions.

I wish a ration including beet pulp and one without, if you please. D. D. S.

Kalamazoo, Mich.

As we have never fed any beet pulp, our answer is necessarily based upon its analysis, not wholly ignoring the fact, however, that those who have had experience with it are quite unreserved in its commendation. It is possible that it has a value beyond its purely nutritive content, as silage, roots and oil meal have, in aiding the digestion of the other elements in a ration. This extra value would not be very appreciable where there are other sources of succulence, as, for example, in combination with silage. If neither silage nor roots could be had, we should advise the use of this beet pulp, but under the circumstances given in the inquiry we would not rate the beet pulp above half the value of the silage or one-tenth the value of the mixed hay.

For the ration without beet pulp we suggest as follows:

FORMULA FOR RATION.	*Dry Matter.*	*Digestible Nutrients*		
		Protein.	Carbohydrates	Ether Extract
20 lbs. silage	5.28	.26	2.80	.14
12 lbs. mixed hay	10.30	.58	4.75	.19
5 lbs. bran	4.41	.63	1.93	.15
4 lbs. gluten feed	3.69	.82	1.94	.12
Totals	23.68	2.29	11.42	.60

We would not feed the above indiscriminately to every cow, for, unless the herd is exceptionally unique, there will be some cows that cannot make profitable use of such feed. This inability may be inherent, and in that case, such cows should be disposed of; or it may arise from temporary disability, length of time since freshening, or other causes. On the other hand, there is almost certain to be other cows that can convert more feed into dairy products; and if so, it is economical to increase their daily allowance. In other words, the amount of feed should be graduated to the capacity of the cow to make good use of it. To make sure on this point, let the milk be weighed and not guessed at, and tested, and the exact figures recorded; and this not for a single week or a month but for all time.

When beet pulp is used the only change we would recommend would be to substitute twenty pounds of it for, say, two pounds of hay.

TESTING CREAM.

Will you please inform me through your paper, the proper method of testing cream, gathered from the hydraulic separator or any other process of raising cream? We have a creamery here that tests the gathered cream from patrons by diluting two-thirds with water, then they test in Babcock's milk test bottles. Then they multiply the test by three and add four to the test. For example: The test shows 7%×3=21+4, makes a test of 25%. The patrons are not satisfied with the test they get. Now, is this the proper way to test cream? Are there not bottles made to test cream without having to dilute with water, or do you consider the test made by diluting with water a correct test? J. W. D.

Auburn, Nebraska.

If exact work is wanted, the proper apparatus should be obtained and the sample of cream weighed into the bottle. This is the only way in which the testing of creams of different richness can be performed with an approach to accuracy.

If you do not wish to go to this extent, the cream can be measured as you are now doing, provided that care is taken in mixing the cream, so that an accurate sample is obtained and the pipette washed out and the washings added to the cream in the bottle. If the cream is diluted, as in the above case, then the scale reading should be multiplied by three and a correction made for the variation which exists when creams of different richness of fat are measured, as follows:

For a scale reading of twenty per cent add 0.25%; for a scale reading of fifteen per cent add 0.1%. Readings between these may be corrected in proportion. Below ten per cent no correction is necessary.

We are at a loss to know what the added four points are for, unless it is supposed to show the amount of overrun. If this is the case, it is decidedly inaccurate and should not be used in this way. The proper manner is to divide the proceeds according to the amount of butter made and the amount of fat furnished by each patron.

THE OATS ARE CHEAPER.

As bran and middlings are both $14 per ton and oats 18c per bushel, which will be the cheaper feed for cows? C. L. O.

Marengo, Ill.

Oats at eighteen cents per bushel are only $11.25 per ton. We account them to have about 10% greater feeding value than bran. Consequently when bran costs $14 per ton, oats are worth nearly twenty-five cents per bushel.

COW WILL NOT GIVE DOWN HER MILK.

We have a cow that has been fresh about two months and has been giving about sixteen pounds at a milking. Now she refuses to give down more than two or three quarts. She has always been handled gently and is naturally a quiet cow. She troubled us a little last year, but the habit seems to be growing. What can we do to make her give down? W. R. R. C.

Otsego Co., N. Y.

It is probable this cow's udder is unusually sensitive and the operation of milking causes some pain. Try milking more gently and at the same time give the cow some bran or other feed to distract her attention from the milker.

Note and Comment.

Drouth and Milk Flow—Effect of Flies—Spiking the Silo Staves—Unsolved Problems in the Dairy—Siloing and Cutting Dry Fodder.

ED. HOARD'S DAIRYMAN:—Making a business of dairying, and leaving it to fight out its future with the "wild elements," are two distinct conditions. To illustrate:—one must say at the start that the drouth here is becoming something to be feared and trem bled over, and if some one would let loose a bull against it, as once did a Pope against a comet, there would be a great dust kicked up to start with, sure. Pastures, there are none, and how to feed the cows with milk at ninety cents and "a rising," is a problem to some; others think nothing about it more than that "Allah wills it!"

Yesterday I saw a young dairyman, and was asking him about the milk yield. "Jerusalem, but how I am feeding the bran, corn fodder and sending the cows down into the big swamp to get something green to eat," said he in reply. "They are shrinking some, but I can't help it, but the flies are the worst bother, I can't fix 'em. Yes, the cows get water in abundance in every lot. Twan't for that they would go dry sure. I can't let them shrink if it does cost. Milk is going up fast, and I must have the high fall and early winter prices, and have milk to sell to get them." Not two miles away is another sort of dairying. The farm is a high and dry affair, depending upon rains, cavities, and a well with a windmill for water for the cows. All three have now failed this company, and the windmill "fell together" at last. Three dollars would have fixed it, but it was not done, and the cows had to be driven a mile to the creek.

Although unsoiled, the dairy was giving thirty-five gallons of ninety cent milk daily when the drive commenced. If a cow could drink 100 lbs. of water a day, why not have her drink it all at once and have it "done to," as Uncle Theodore expresses it. So they are watered once a day after a dusty drive of one mile, and with the result, a shrinkage of 200 pounds of milk per day, and still a "goin' down." One dollar and eighty cents a day is a pretty good rebate to pay upon an outlay of two or three dollars for pump fixing, still this is the way that some folks make their profits, in what they save, and at the same time accounts for much of the "dairying does not pay" talk.

***

While one swallow is not a proof of summer, any more than a rise in coal means immediate winter zero weather, still I like to try things on a small scale now and then. So last week I tied a blanket on a cow to see whether keeping the flies off would affect her yield of milk, the feed remaining actually the same. The first twenty-four hours showed little result, but then the milk began to increase and by the fifth day the gain was four pounds of milk a day, or four cents a day interest on a ninety cent investment in a blanket. Of course four cents cannot be multiplied by 365 days, but there is a hint in the matter worth considering as well as the apparent comfort of the cow. Was this 0.52 of a pound of solids, the actual expenditure of force material before used by the cow in keeping herself free or—attempting to—from flies? As this test was on a cow that was eight months in milk, a fresher cow might have shown a less marked result. What does the Short stop editor say about it?

***

So long as Adam remained in the garden, it was a pretty hard job to convince him that the earth was round. Same way in silo building. Some of the die-hard-ones have an idea that while Buff Jersey seems to have a good thing in spiking the silo staves together edge ways, he cannot again pull them together with a hoop when they shrink out in the summer, and one would have to run the chance of the staves swelling to an air proof joint. What are the facts, friend Jersey? If it is the thing, it is valuable as it knocks the staging fixtures all to pieces. The inventive age may be said to have arrived in the history of the silo.

***

I have recently been greatly interested in reading Prof. Van Slyke's "Unsolved Problems in Dairying" and hope that from his great fund of experimental knowledge, he will give us farmers many rays of light in the days to come. He is not sure that the compounding of rations for cows has been always free from the theoretrical. There is a general belief that the fat of milk is a result of protein in the food and that milk cannot be profitably made without one-fifth of the ration is digestible protein. He thinks there is unquestioned proof that fats in milk can be formed from starch and sugar foods, and that the feeding of highly nitrogenous rations are not essential. He doubts, it seems, that fats in food have very much if anything to do with the fats in milk, and that to some extent proteins have their value in producing a stimulative effec , rather than one of construction, i. e., reappearing as an increase of fats in the milk.

In an indirect way all this is proof that the feeder can not change the character of the milk by increasing the amount of either fat or protein in the ration, a thing which many dairymen assert with Andrew Jackson's tenacity of belief, that they are doing, or could if they wanted to.

That there has been some juggling with the character of the milk for a day or two, we believe to be the explanation of the matter, but do hope that Prof. Van Slyke will settle it some way so that we can have a new bone of contention to "argy" over at the institutes in the future, for up to date the best definition of fat formation in milk we have seen is that by a noted scientist that "Fat formation in milk is the expression of a quite specific adaptability of the living protoplasm of the milk cells;" though we doubt if Charley Jennings can tell whether the definition is a joke, or a symbol of scientific ratiocination.

***

I am still getting silo inquiries and silage information wanted, but our last was about cutting dry fodder into the silo after the corn was husked, and yet this man wanted grain and all for the cows. What passes my comprehension is why men want to husk corn and grind it to mix with the fodder and the hay. There is a great loss in drying the fodder. Most authorities put it above twenty per cent.

No man can husk, crib, grind and pay toll on corn ears for less than one-fourth of the market value of the grain, which is another fourth, loss, but by another process. If I remember rightly, Prof. Henry found that to keep corn unhusked, and in good shape, then cut it ears and all into one-half lengths and feed it, that its feeding value was one eighth more than could be realized from it by husking and grinding its grain and then feeding it back with the fodder. It meant that the labor of husking and grinding was all thrown away.

When one comes to cutting dry fodder they will find that the saving in weight handled, is quite made up by slower cutting, imperfect work, increased power demanded, not to mention an all winter's job. All of these plans are excuses for not building a silo, and loss at every point is the penalty for refusing to build and use them. JOHN GOULD.

Notes from Southern Michigan.

Environment of the Dairy Herd.

ED. HOARD'S DAIRYMAN:—This matter of environment is of great importance. When a small boy, I frequently saw dairy cattle pastured in the corners of rail fences, during the coldest winter weather, and snow covering their backs for days at a time.

That was an extreme that needed the attention of the society which prevents cruelty to animals. But now we have another extreme, practiced by some dairymen, that needs the attention of the dairy papers and proper health officers, if not of the above named society.

It is being reported, far and wide, that tuberculosis is increasing among dairy cattle at a terrible rate, especially in the eastern states. It is true that this disease is slowly increasing in certain dairy districts, but not to the extent that the alarmists would have us believe. I do not believe that five per cent of the cattle of Michigan are affected with this disease, but this estimate of course includes all classes and breeds.

But there is some cause for alarm, and it is high time for dairymen and breeders to "look out." The present general "hot-house" treatment, or rather the environment of many herds of dairy and breeding cattle to-day represents the other extreme to which I wish to refer, and is aggravating and spreading tuberculosis among cattle to a serious extent in some dairy districts. It is within the province and power of our dairymen to control and limit the spread of tuberculosis, I verily believe, by so changing the environment of their cattle that neither extreme be followed.

Of course, where disease is present, it must be eliminated. But the owner of a herd of healthy dairy cattle should have no serious trouble in keeping his animals in a generally healthy condition, provided their environment is maintained in a rational manner.

During the last five years I have visited and inspected many hundreds of herds of dairy cattle in Michigan. In some cases an ideal plan of housing, caring for, and feeding the cows was steadily maintained, due regard for the health of the cattle being constantly considered. In other cases the environment or treatment was such that but a few years can elapse before disease will make its appearance in the form of tuberculosis, and whole herds of fine dairy cattle be almost entirely wiped out.

How can this danger be avoided? Our own herd is in a healthy condition. We know this because the tuberculin test has been applied with not a single reaction. We shall buy no more animals hereafter from strange herds that have not been tested, unless the seller will guarantee each animal to pass the test. In selling stock we shall be willing to make a test before the transfer is made. This practice is bound to obtain to a large extent in the leading dairy districts during the years to come.

We feed our cows liberally, but never try to force them for a "record." We house them in a comfortable stable, but we do not believe in continuous stabling. Our stable is not a fancy, air-tight box, but fairly well ventilated, and we turn our cows out for a short time every pleasant day during the whole winter. Much as our good friend, John Gould, believes in continuous stabling, from November until May, we have seen too many tuberculous cows as a partial result of this practice, and could not be induced to put our cows in close confinment.

Extremes seldom pay, and why cannot our brother dairymen follow the "happy medium" of safety in their plan of environment of their dairy herds? Sometimes I think I do not want our cows watered in their stalls, but of course a water supply system can be arranged to obviate any contamination of the individual supply of water for each animal.

One of the most serious problems in securing proper and healthy environment of dairy cattle is in the perfect ventilation of stables. I have been greatly interested in Prof. King's experiments in this line. In the building of future cow stables, more attention must be paid to furnishing a larger number of cubic feet of air space to each animal. Stables must be larger, ceilings higher, and provision be made for keeping the air constantly, but gently, in circulation, without creating a draft.

If these conditions be followed in a rational manner, without the hot-house treatment of forcing for a great record, commencing with a healthy herd, we do not believe there is any serious danger of disease. Then my next advice would be to observe the utmost cleanliness and to thoroughly disinfect the stables, stalls, floors, mangers and gutters frequently. With these sanitary precautions there is little danger of tuberculosis or any other disease. Of course, I would not allow any man suffering from tuberculosis to work in my cow stable.

These conclusions regarding the proper environment of dairy cattle are the result of actual experience. During the last two years I have assisted in testing over 1,500 head of cattle for tuberculosis. Some of the cattle slaughtered were absolutely rotten, and others in the first stages of the disease. Others were quarantined and re-tested. I do not believe in destroying all cows that react on the first test, under certain conditions.

But I have seen enough of this insidious and terrible disease, and carefully studied the conditions, until I feel that every dairyman and breeder of pure bred dairy cattle should be warned against aggravating the disease by improper environments. The tuberculin test may be applied and wholesale slaughtering may go on at great expense, until "dooms-day," but unless there is some reformation in the environment of dairy and breeding cattle, and this modern "extreme" be more carefully avoided, tuberculosis in our great dairy sections will increase until it becomes as serious as it now is in European dairy districts. Never Disappoints

The Summer Silo And the Fly Pest.

ED. HOARD'S DAIRYMAN:—In the letter by J. E. G., on page 582 of the DAIRYMAN I find two points that I would like to carry a step further. They refer to ensilage and the fly pest.

It now looks as though the silo would take the place of all sorts of soiling in dairy work just as soon as the real value of it is well appreciated. It is well enough to have green fodder at command through the summer season and most of the better class of dairymen try to do so, but there are times when that will also fail. In not a few parts of Western New York this season, the weather has been so dry that even sowed corn has failed to make growth enough to make it of much value. The pastures have stood still, if indeed they have not burned over, either by the scorching rays of the sun or fires that came for the most part from the railroad. It has been a terrible season and has lasted from early spring.

What was my surprise and gratification on talking this week with an acquaintance, a man of education and well known to science, to learn that he was actually profiting from the drouth. He has an Erie County dairy farm and his pastures stood still, as did those of his neighbors, but he had some well-filled silos left over, and he proceeded to feed his cows twice a day from them all summer. The result is that where the milk of cows confined to pasturage ran down more than half, his cows have given about as much as usual. The cost of silage is more than of pasturage, but he assures me that he will make money, for all that, on the rise in cheese.

It was at first supposed that ensilage would not keep over summer, but that idea is already exploded. My friend rates it along with canned fruit and says it will keep as well if properly put up. This fact reduces the feed question to its lowest terms and practically places the farmer out of the reach of drouths.

In warm weather the fly question is close to that of feeding. Our domestic animals are giving their substance to these pests and are correspondingly worthless in spite of themselves, to say nothing of the discomfort they endure. I am sure that J. E. G., in using applications to drive away flies or in shutting up his cows in a dark stable to avoid them, is working in the wrong direction. At the best this is but a stand off. It may benefit the individual animal, but it will be at the expense of those that are not taken into the account. Trying to keep the flies on short rations will only make them the more ravenous; it will not exterminate them. They will breed just as much as ever. If we can cut off their breeding places we will do well

Silo Milk has just as fine flavor as any if the Champion Milk Cooler–Aerator is used at the farm. Our book about it free.

CHAMPION MILK COOLER COMPANY,
67 Main St., Cortland, N. Y.

and much ought to be accomplished in that direction, but I am convinced that the real remedy is from fly traps.

Some recent successes with sticky fly paper, with which we made war on the house flies at the farm, convinces me that this could be used with much effect against all flies, but I would like to see a trap made on the plan of a mosquito bar, say out of some sort of canvas that could be set up, tent fashion. The cows could be induced to go inside of it by a wide doorway and then come out of a passage so narrow that it would brush all the flies off and leave them inside the net or tent, where they could be killed by pressing the sides together.

It is strange to me that the fly question has been allowed to take care of itself so long. It is a great source of loss as well as of distress to our domestic animals. Who will be first to come to the rescue of the poor beasts, not by brushing the flies away to go after some less favored creature, but to kill them outright and rid the earth of them? They do not travel very far and ought to be killed on every farm as fast as they appear.

Erie Co., N. Y. JOHN CHAMBELIN.

Dangers Attending So-Called Food Preservatives.

Of late then have sprung into existence a number of preparations, claiming to be safe and efficient food preservatives. They have been hawked from house to house, especially in rural districts, and on the strength of representations made by agents have found employment domestically in the canning of fruits and vegetables, and preservation of milk and milk products; fortunately, however, the representations made as to their efficiency in the preparing of meats have proved delusive, and thus in many instances led to their general abandonment as regards other domestic products. How far they have been, or are now, employed by factories engaged in wholesale production and marketing tinned products is a matter solely of conjecture, yet there are good reasons for surmising they are generally ignored, except, perhaps, in the preserving of the poorer and cheaper grades.

The least objectionable of these so-called preservatives owe what little virtue they may be possessed of either to salicylic or boracic acid, sodium salicylate or sodium biborate (borax); it is said that fluoric acid is sometimes employed, but no data or definite evidence is obtainable regarding such use or this agent.

As regards salicylic acid and salicylates, the dangers attending their employment have been thoroughly exploited in the past; further, the changes induced in the presence of fruit acids, whereby abnormal colors are developed, are in the majority of instances inhibitory. Boracic acid and borax, however, are in general use in some foreign countries for the preservation of products that are to be exported, but are forbidden by law as regards those intended for home consumption. These drugs, too, are popularly believed to be "harmless," which if true would simply mean they are in inert, and of little or no utility. They are, above all, cheap and can be obtained anywhere.

Within a few months, several cases of severe and dangerous poisoning, as the result of the employment of boracic acid and borax, have been chronicled in the medical press, both of America and abroad. In one instance five of a family numbering seven souls all told were seized with severe and excruciating colic accompanied by nausea and vomiting, that prostrated the unfortunates for three and four days; the trouble was brought directly home to the milk employed as a beverage, and to which had been added a preservative powder consisting of almost pure boracic acid. Two members of the family escaped because the milk used by them was only what was required for a cup of tea. The same milk, fed to half a dozen fowls, killed all but one, and this was rendered so ill that it was dispatched. In another family, numbering nine individuals, six partook of milk which had been "kept sweet" by the aid of borax, and all were thereby made seriously ill. Several cases of dangerous—and one of fatal—poisoning of infants and children by borax, fed in milk, are on record. Probably many more have escaped notice, the malady being ascribed to "cholera infantum," "summer complaint," colic, etc.

That accidents are not more frequent from the careless and ignorant use of these drugs, aside from the reason just mentioned, is due to two causes: First, the distress occasioned thereby closely resembles that which is apt to follow upon indiscretions of diet and improper exposure. Second, many adults are but slightly susceptible to the malign influence of the drugs, when they are only taken into the stomach casually and occasionally in moderate and unrepeated doses. As regards milk, it is possible, as has been suggested, that the drugs produce certain chemical changes therein, producing a new toxic agent, or enhancing or intensifying the untoward effects of the boracic acid or its sodium salt; but this has never received careful investigation and study.

Borax and boracic acid have been employed in a variety of diseases, both as internal and topical medicaments, and of late years—the former especially—have been exploited as remedies for epilepsy, though now practically abandoned because of the unfortunate results that follow in their train.

A single large dose, as already intimated, induces derangement in the digestive aparatus that simulate colic and the results accruing to indiscretion in the use of foods; besides, the action is very much like that provoked by toxic doses of lead. When taken in divided doses, and persisted in for some time, a burning, colicky pain in the "pit" of the stomach is experienced, followed by intense nausea and vomiting; the mouth and throat are dry, and there is a remarkable dryness of the hair and skin, the former falling, the latter developing skin diseases, resembling eczema, salt rheum, etc. *Most unfortunate of all is a tendency on the part of both drugs to develop and foster kidney disease, or when such is already existent in simple and acute form, to transform it into one of chronic, malignant, and fatal character.*

With this knowledge, it is evident too much circumspection cannot be employed as regards the use of so-called food preservatives, and that as a rule such should be regarded with the utmost suspicion, particularly if their exact contents or composition is unknown.—*Scientific American.*

STAND BY YOUR SPECIALTY.

St. Paul talks plainly to those shifting Christians who are moved about "by every wind of doctrine," and D. H. Otis, of the Kansas Experiment Station, who is doing a lot of good, practical dairy work in that state, writes as follows under the above caption:

A creamery patron, who milks cows when butter fat is high and beef low, but who turns his attention to beef when butter fat is low, sends in his dairy report for a year and at the close remarks: "Profits scarcely visible to the naked eye. What shall we do to be saved?"

Breeding a herd of cows for milk one year and beef the next, is a suicidal policy that no enterprising breeder would dare practice. By this haphazard method the above patron realized for butter fat $19.63 per cow per annum. The Kansas Agricultural College scrub herd pushed along dairy lines brought an average of $37.75 per cow per annum. This difference of $18.12 per cow is what would have been visible to the naked eye, had his cows been handled as the college cows were handled. "What shall we do to be saved?" Settle upon some definite line of work, study the business in all the details, find out what others are doing in the same lines, make your business a hobby and above all stick to it.

As plain and straightforward as the above advice is, it is too plain to be seen by lots of farmers. They like to "gamble" on a shifty, changing sort of farming, for there is just enough uncertainty about it to make it attractive. Then, besides, it is charming to think of a cow that you can do anything with—but make money.

Co-operative Dairying in Holland.

According to the German paper, *Milch Zeitung*, an extraordinary development has of late years taken place in co-operative dairying in Holland. For several years, says that paper, much attention has been paid to the manufacture and marketing of butter, now nearly all carried out on co-operative principles—peasant proprietorship in that country being almost universal. Large butter factories, too, are the rule, where the most advanced methods are adopted. For instance, with a view to making first-rate butter, the cream is often pasteurized and separated by the Schwartz process, instead of by the centrifugal system. Artificial cultures are often used, and the result is most satisfactory. So are the simple, but very businesslike methods of marketing. At Maestricht a combined association disposes of the great bulk of the butter and cheese made by the members. It not only sells the produce for its members upon co-operative principles, but endeavors to put the individual dairies into direct business relation with foreign firms, particularly in England, with the aid of the Dutch consular agents.

The Butter Won't Come.

ED. HOARD'S DAIRYMAN:—I am having trouble with my cream. It will not churn thoroughly. The cream will get in a granular form, but will not unite, except a very little of it. The little butter we do get is nice. The cream is taken direct from separator, after running through a screen, and placed on cellar bottom, or in running water both having a temperature of about 68° F. We put two creamings together for a churning. After setting awhile the cream forms into two parts; the upper forming into little granules, while the lower seems like whey. We separate direct from cows. C. E. S.

Martins Creek, Pa.

We might be able to help if more data were given, but as nothing is said about the degree of ripeness or temperature of churning, we can only suggest where the trouble may be.

Are your two batches of cream of the same ripeness? Is one batch a little sweeter or sourer than the other? Do you keep them separate until ready to churn? How often do you churn and at what temperature? Does your cream have a clean, sour smell and taste, or is it curdled without souring? If we knew something about the above points, we could advise you better.

The only point that helps us is the statement that the cream separates into layers, the lower one like whey. This would indicate an over ripening and "wheying off" of the cream, a condition which causes the formation of viscous compounds in the cream, and consequent poor churning. The past hot weather was liable to cause very rapid ripening, and if this process is carried beyond its proper point, the butter loses both in flavor and yield.

This is especially true, if the ripening has been allowed to go on until the cream "wheys off," for at this stage the churning is often but partly completed, and the butter, what there is of it, of poor flavor.

Looking carefully to the ripening of the cream and the churning temperature will cure nine out of ten cases of poor churning.

Cedar Hill Dairy Notes.

Handling the Bull.—Poultry.—Filling Silos.

ED. HOARD'S DAIRYMAN:—That bull, and how to handle him, is much written about. At Cedar Hill farm our bull is a source of recreation as well as useful; at the same time he is rendered docile and easily handled. Our boys have broken him to saddle and also to harness.

They drive him to town three miles in a two wheeled road cart, using a single harness on him, and busy days when they do not have time to drive or ride him, they put him in the tread power and let him run it for an hour. This exercise makes him glad of a rest and keeps the mischief down.

We keep him tied all of the time. He is kept free from flies with our shoo-fly and is the picture of health and vigor.

***

Many inquiries have reached our desk lately from dairymen who have read our poultry articles in various journals. The general tone of these is that our substituting poultry for hogs, will not pay. Yesterday we weighed two cockerels fourteen weeks old; they weighed four and one-half pounds each and at present produce prices we can get fifty cents each for them. Multiplying this by several hundred that we have, makes a total that is worth considering; but our aim is eggs during the winter months when prices are high. With our frost proof houses and steamed foods, fed to the greatest of laying breeds, Leghorns, we will realize as much from a dozen eggs as a pound of butter.

Vermin do not trouble us. From our sulphuric acid jug we not only make our milk tests but also get the best vermin destroyer we have yet used; we use four ounces of acid in three gallons of water; this we use with a spray pump in houses and on any ground we may mistrust is infected.

***

In ten days we will be cutting our ensilage crop. We see so much written about how to build silos but very little how to fill. Our method may interest some of the DAIRYMAN readers. We have a sixteen inch cutter, thirty feet carrier and twenty-eight feet conveyor, driven by a ten horse boiler and eight horse engine; the engine is fifty-five feet from cutter. We use a sack tube on carrier, saving one man in silo; use only low wheeled wagons with flat decks. A Deering corn binder saves us four cutters, one loader, and one team and driver, over old way, besides we can handle more corn in a day than old way. "BUFF JERSEY."

Selection of Breeds.

ED. HOARD'S DAIRYMAN:—The article from the pen of J. M. W. Kitchen, M. D., of New Hampshire, in September 1st number HOARD'S DAIRYMAN, to my mind contains points in reference to the selection of breeds, well worthy of thoughtful consideration, and especially to many of our eastern dairymen and stock breeders.

Some two years since, the writer contributed a short article stating some of the desirable qualities of the Short-horn, and profits derived from the sale of butter and stock, by keeping the increase from a grade Short-horn dairy, of twenty cows, till two years old before disposing of same, instead of vealing or selling the calves later on; believing that in pursuing such a course the net profits would be equal to those derived from the same number of Jersey or Guernsey cows; that the eastern farmer could keep his young cattle and attend to their wants much easier and less expensively than a herd of all Jersey or Guernsey cows could be kept.

F. H., of McGregor, Iowa, took exceptions to statements therein, and more especially to the weight and price two year old cattle had been quoted at. Well, if those figures then looked large, what will he think when informed that the same class and heft of cattle are now selling at $46 per head, instead of $40, as quoted two years ago.

One of my neighbor farmers has just disposed of 155 head two-year-old steers at $46 per head, off his grass pastures. Other lots are selling at only one dollar per head less. They are not of the screw auger kind, however, nor are they of the Holstein blood.

The latter breed are great milkers, but the steers seem to require more age to round out and lay on fat, than the Short-horn. The latter breed, if as great pains be taken in selecting a sire to head the herd and heifers from only the best milkers be saved, as is taken by owners of other breeds, will be found so nearly equal to the best of other kinds that no farmer need be ashamed of their record.

Some of our Chautauqua County farmers have tried the Jersey, Guernsey, and more recently the Holsteins breed as dairy cows, but very few, however, have made a success by the keeping of either of the two former breeds. The latter, however, seems to be holding their own fairly well.

Chautauqua County has been and still continues to be the home of the Durham. So much so that it is very doubtful if any other breed very soon takes its place or crowds it out to any great extent. Somebody has got to raise beef cattle, and surely it does not look like an over supply coming from the

THE APPLETON CORN HUSKER
Is the only one made which successfully fills the demand for a satisfactory, strong and durable husking machine, low enough in price to be within reach of every farmer.

It excels in lightness of draft and can therefore be run to do a satisfactory amount of work with less power than any husker made. If you want a husker, sheller, ensilage or fodder cutter, shredder, wood saw, grinder, sweep power, tread power, wind mill, etc. we can furnish you the best. Our 160-page catalogue will convince you. IT IS FREE.

Jersey and Guernsey breeds. Their breeders argue, while some of their followers believe, that a cow to do well at the pail can never be very valuable for beef herself, or bring a steer worth keeping for that purpose. The breeders of the Short-horns are perfectly willing others should stick to that belief, well convinced that every herd of Jerseys or Guernseys so established, tends to raise the price of his two-year-old steers in just that proportion.

What a blessing that we cannot see all alike; were it so what a tumbling over one another there would be in securing houses and lots in McGregor, Iowa. T. J. F.

Chautauqua Co., N. Y.

Our Special Elgin Letter.

ED. HOARD'S DAIRYMAN:—The offerings of butter on Monday's board of trade, aggregated 5,040 pounds and all was sold at an advance of one cent to a cent and a half. Bidding opened at 22 cents and 2,640 pounds sold at that figure. The remainder, 2,400, brought 22½ cents and more could have been sold at a like figure. The quotation committee announced the market firm at 22½ cents. The sales reported were as follows:

Factory.	*Pounds.*	*Price.*
Darinda	1,800	22
Red Clover	2,400	22½
McConnell	840	22
Total	5,040	

The markets for the corresponding week of the three preceding years were as follows:

Sept. 12, '98, 11,160 pounds of butter sold at 20c.
Sept. 13, '97, 12,300 pounds of butter sold at 17½c.
Sept. 14, '96, 53,280 pounds of butter sold at 15c.

The New York market Monday was reported firm at 23 cents. H. C. B.

Elgin, Ill., September 11th, 1899.

A Wide Circulation.

ED. HOARD'S DAIRYMAN:—There has been an unprecedented demand for bulletin No. 75, "Testing Cows at the Farm," which was sent out by this department recently. A second edition has been ordered so that the calls which are constantly being received for this bulletin may be supplied. One creamery company has asked for four thousand copies for distribution to its patrons, and others want from two to six hundred copies for the same purpose. E. H. FARRINGTON,

In charge of Dairy School.

A Remedy for Rats Wanted.

ED. HOARD'S DAIRYMAN:—I find your paper holds such a valuable fund of information, that I am taking the liberty of asking you, or any of the readers of HOARD'S DAIRYMAN, through it's columns, how to rid my farm of rats which will not eat poison, get caught in traps, or give one an opportunity to shoot them. They breed under the chicken houses and are overrunning my farm, cellars, barns, chicken houses and private dwelling. I shall consider it a great favor if you can suggest anything that will rid me of this pest. C. S. STILLMAN.

Middlesex Co., Mass.

DAIRY MARKETS.

ELGIN, Ill., Sept. 11—Eighty-four tubs offered, 40 sold at 22½c; 44 sold at 22c; committee reported firm, 22½c.

CHICAGO, Ill., Sept., 11—Butter—Creamery, extra, 22c; firsts, 19@20c; seconds, 15½@16½c; dairies, selections, 17c: No. 1, 15c; No. 2, 14c; extra ladle, 13½@14c.

Cheese—Full cream, Twins, new, good to choice, 10¾@11c; Young America, 11@11½c; Swiss, 9@11c; Limburger, 8@9c; Bricks, 9@10¾c.

Eggs—Fresh, at mark, cases returned, sold at 12@13c; loss-off, cases returned, 14½c.

Cattle—The better grades of native and range cattle ruled steady, with other grades weak to 10c lower. Trade was active, and an early clearance was made. The best natives offered sold at 6.00; best grass westerns, 5.25, and best straight Texas, 4.90. Most of the native beef cattle sold at 5.50@6.25, and grass westerns largely at 4.50@5. Native butcher stock sold actively at strong prices. A car load of fancy 1,228-pound cows sold at 4.90 and some fancy 941-pound heifers at 5.55. Feeding cattle were in active demand. A lot of 150 Canadian feeders, averaging 742 pounds, sold at 4.25.

Bran—In fair request and steady, with sales at $12 in bulk and $12.75@13 in sacks.

MILWAUKEE, Wis., Sept. 11—Butter—Creamery, fancy prints, per pound, 21½c; extras, 21½c; firsts, 20@21c; seconds, 18@19c; imitations, 17@18c. Dairy—Selections, per pound, 16@18c. Market strong, as the scarcity continues while the demand is good. Receipts, 10,755 pounds.

Cheese—American full cream, new, choice, to fancy, 10@11c; Brick, new, per pound, choice, 9½@10c; Limburger, new, choice, 8½@9c; Swiss, new drum, choice, 10½@11c; block, 10½@11c; No. 2, 9½@10c. Market steady; receipts, 7,700 pounds.

Eggs—Fresh, per dozen, 14c, loss-off, cases returned. Market strong and continues to advance, choice lots being scarce and wanted; receipts, 260 cases.

MUSCODA, Wis., Sept. 11—Offerings today, 1,281 Twins; market quiet, car lots, 10¼c; local lots, 10⅜c; 130 whites sold at 10⅜c.

FOND DU LAC, Wis., Sept. 11—Offerings 833 Twins and 420 Daisies; market quiet at 10⅛@10¼c.

SHEBOYGAN FALLS, Wis., Sept. 6—Sixteen factories offered 1,160 boxes of cheese on the call board to-day, and all except 45 cases of Young Americas were sold as follows: 560 cases Young Americas at 10¾c; 200 Twins at 10½c; and 355 Daisies at 10¾c. The market was less active than for two weeks past and not a bid was raised after being placed on the board.

MANITOWOC, Wis., Sept. 6—Offers of cheese at the dairy board today were 900 boxes of Daisies, 160 boxes Twins, 900 boxes Young Americas. All offerings Daisies sold at 10¼c; Twins at 10¼c; 450 Young Americas at 10½c; 450 Young Americas at 10½c.

NEW YORK, Sept. 11.—Butter—Creamery, Western, extras, 22½c; firsts, 21@21½c: state extra 22@22½c; firsts 20½@21½c.

Cheese—State, full cream, small, colored, fancy, 11⅝@11¾c; white 11¼c; large, colored, 11½@11⅝c; white 11⅜@11½c.

Eggs—State, Pennsylvania and Western 17½@18½c.

KANSAS CITY, Mo., Sept. 11.—Butter—Creamery 20c; dairy 15c.

Eggs—Fresh 12c.

CINCINNATI, O., Sept. 11.—Butter—Firm.

Eggs—Firm, higher 13c.

Cheese—Firm; good to prime Ohio flat 11@11¼c.

ST. LOUIS, Mo., Sept. 11.—Butter—Firm—Creamery 17@21c; dairy 13@17c.

Eggs—Higher at 12c,

BALTIMORE, Md., Sept. 11.—Butter—Firm; fancy creamery 22@23c; fancy imitation 18@19c; good ladle 14@15c; store packed 12@14c.

Eggs—Firm, unchanged; fresh 17@18c per doz.

BALTIMORE MARKET.

BALTIMORE, Md., Sept. 7—The absentees, who during the earlier summer months betook themselves to the green fields and pastures new, and there fed on viands and other nutriment that didnot pass through our hands, including butter to give savor to the good things that ripen about them, have turned their hastening footsteps towardour cityand quite a percentage, who have outstripped the majority in a race for home having arrived and brought their appetites along, are making their home comingpal pable in the increased demand for the table grades of all varieties of butter, bothfresh and freezer stock, the latter being a temporary shift however, made necessary only because of the receipts of fresh having been adjusted to the summer condition, which was by a large majority decided to be a record maker for spending the season out of town. Separator creamery can be regulated as to receipts of fresh, with greater ease than any other kind, so that item gives little or no concern to the receivers; but our merchants are unanimous in their call for an increase of supplies of gathered cream, imitation creamery and ladle packed, from points of production. There is a larger and growing demand for thirty pound tubs of gathered cream creamery, and probably quotations would be exceeded. Exporters have shown some more activity, and it is manifest that the demand from the other side has not been satisfied, although the shipments have been heavy —very heavy indeed for August. At present, there is a shortage in prints and blocks which will not be a feature as soon as the consumptive demand in the near by country slackens. The light receipts of store-packed find prompt sale on arrival.

Creamery Separator, extras, 21½@22c; firsts, 20½@21c; seconds, 18½@19c. Creamery Gathered Cream, extras, 19½@20c; firsts, 18@19c; seconds, 17c. Creamery Ohio, extras, 19½@20c; firsts, 18@19c; seconds, 17c. Creamery Imitation, firsts, 16½@17c; seconds, 15@16c. Iowa & N. W. ladle, 15@16c: seconds, 14c. Ohio & Indiana Ladle, firsts, 15@16c; seconds, 14c. Ohio Storepacked, firsts, 13c; seconds, 12@12½c. W. Va., firsts, 13c; seconds, 12@12½c. Creamery Blocks (2-lb), extras, 23½@24c: firsts, 22@23c; seconds, 21c. Creamery Prints (½-lb), extras, 23½@24c; firsts, 22@23c; seconds, 21c. Md., Va. and Penn. Prints, extras, 20c; firsts, 19c; seconds, 17@18c.

Cheese—Receipts of cheese, fair; demand good, market firm. N.Y.State Cheddars, fine, 12@12¼c; choice, 11½@11¾c; fair, 10½@10¾c. Flats, 12¼@12⅜c; choice 11¾@12c; fair, 10¾@11½c; Small, fine, 12½@13c; choice, 11¾@12¼c; fair, 10¾@11½c Ohio—Flats, fine, 11½@12c; choice, 10¾@11½c; fair, 10@10½c. Ohio Picnic, fine, 11¾@12¼; choice, 11@11½c; fair, 10¼@10½c. Swiss Cheese, fine, 12@13c; choice, 11@11½c; fair, 10@10½c.

Eggs—The receipts of all choice to fancy eggs are extremely light; our market rules firm and strong for all desirable stock; the demand is active at 16½c; we advise prompt and liberal shipments of fresh stock, as our market was never in better condition than it is at present. Please bear in mind that our quotations are for fresh, and not for heated or other inferior stock.

301 Exchange Place. G. M. LAMB & BRO.

NEW YORK MARKET.

NEW YORK Sept. 9—Butter—Receipts for the week, 33,119 packages. Exports for the week 3,454 packages.

There has been a fair current of business through the week with motion enough to keep stock fairly well distributed through regular channels, at an advance of fully 1½c per pound. Prices are now up to a point where there is hesitency on the part of buyers as to increase of load, and at the moment many prefer to decrease than to increase stock. The outcome, however, is in favor of a large fall business, and perhaps higher prices for finest grades of butter.

Early in the week prices for extra fresh creamery was advanced to 21½c, and at the close was quickly taken at 22@22½c; under grades were enquired for, and sold readily at 18@21c; fine dairy, hardly enough coming to make price, few parcels fine sold at 20@21c, and fair to good quality at 15@18c. Fresh ladle butter is in light supply and good demand with sales at 14@16c, the latter price for finest marks. Fresher goods have had some call from out-of-town buyers, and we note sales of several hundred tubs best June Creameries at 21@21½c, also small lines of June Ladles at 15½@16½c. We quote:

Creamery, extra, 22½c; medium, 20@21c; poor, 16@18c. Dairy, extra, 20@21c; medium, 17@19c; poor, 14@16c. Ladle, extra, 15½@16c; medium, 14½@15c; poor, 14@14¼c.

Cheese—Receipts for the week, 37,270 boxes. Exports for the week, 8,019 boxes.

Exporters have shown little interest this week, and the local trade was not so snappy, and prices however, are steady at the close. Sales of large cheese were at 11@11½c, and small sizes at 11½@11¾c. Under grade cheese are scarce, and wanted at 9@10½c. We quote:

Full Cream, small extra, 11½@11¾c; medium, 10¾@11¼c; poor, 8@10c. Full Cream, large, extra, 11@11½c; medium, 10½@10¾c; poor, 8@10c

Eggs—Receipts for the week, 49 616 cases. Market about same as last week; fine, fresh stock all wanted at full prices, and inferior goods dragging at quotations ranging from 13@16c. We quote:

N. Y. State & Penn. best marks, per dozen, 18@19c; Western & Northern section best marks, 17@17½c; other sections inferior quality 13@16c.

177 Chambers St. DAVID W. LEWIS.

1899 the Greatest of "Alpha" Disc Years.

For eight years past every year has been an "Alpha disc year in the sale of cream separators, their success being greater from year to year and greatest of all in 1899.

Beginning with a relatively small sale in 1890, the superiority of the "Alpha" disc system was so great as to achieve instant success. The sale in 1891 was double that of 1890, and the sale of "Alpha" disc machines has thus continued to virtually double itself from year to year, in the Factory and Dairy sizes combined.

The recognized supremacy of the "Alpha" disc system is now so great in Factory separators that the purchase of De Laval machines in 1899 has been almost universal, exceeding 95 per cent of the total sales in the West, and 85 per cent in the East. In the Farm or dairy sizes of machines the users of such separators have not yet come to so well understand the differences between separators, but are rapidly acquiring this knowledge from practical experience, and the same percentages nearly hold good, and within another year or two will undoubtedly do so.

Users of separators—whether big or little—have come to understand that **The "Alpha" Discs are literally the heart and soul of a perfect cream separator** and that the all around efficiency and general practicability of the "Alpha" disc machine is simply unapproachable by anything else that can be put together in the shape of a cream separator, regardless of price, clap-trap claims of would-be competitors and every other conceivable consideration.

The differences in principle and construction between the "Alpha" and other separators are fully illustrated and made plain to every one in the De Laval catalogues—Creamery or Dairy—which may be readily had for the asking.

The De Laval Separator Company,

WESTERN OFFICES: Randolph & Canal Sts., CHICAGO.

BRANCH OFFICES: 1102 Arch Street, PHILADELPHIA.

READING NOTICES.

All Reading Notices under this head are at the rate of 25 cents per line.

Jerseys For Sale—Two cows, one two-year-old, one yearling, and one heifer calf and two bull calves, all registered in Cattle Club record, and choicely bred. B. F. WYMAN, Sycamore, Ill.

For Sale—My herd of 32 grade Holstein cows, all of my own raising, and bred from choice milking Durham cows. Age from 5 to 8 years. Average weight about eleven hundred pounds. Received for milk an average of $60.00 per cow last year. Bred to freshen the last week in September and during October. Will give more milk the coming year, as all are mature and freshen earlier. Milk tests from 3.6% to 4.10%, All easy milkers. No kickers or steppers. Bred to a fine Durham bull. Price $60.00 each. Herd located at city limits of Dixon, Ill. Correspond with A. G. JUDD, Warren, Ohio. 31-3

For Sale—Cheap for cash. Beautiful country home. Six miles from Nashville Tenn. On good pike. 120 acres. Especially adapted for dairying. Address "P," Glencliff, Tenn.

Experienced man, married, Swiss, wants position on stock or dairy farm. Good recommendations. Address P. O. Box 171, Monticello, Wis. 31-tf

Wanted—Position as helper in creamery. One year's experience. Box 90, Poynette, Wis.

Do you want to correspond with an old New York butter and cheese maker. Twenty-five years experience. Can make fancy goods. Address F. M., care HOARD'S DAIRYMAN.

I will give $10 to any one getting me a good dairy farmer for my place. Rent or shares. Carries 30 to 40 cows. I furnish half. Milk nets $1 per hundred year round and $180 per month. G. M., Box 167, Waukesha, Wis.

Wanted—A Jersey herdsman with great experience, who is a No. 1 feeder and milker and gilt-edge buttermaker, is seeking employment. Good references and by myself. Address THOS. ARKELL, Dodson, Mo.

Tamworths, ready to wean, $10 each, or $12.50 delivered. Hermanville Farm, P. E. I., Canada 32-52

Wanted—A practical and reliable dairyman to take charge of my dairy farm, and will rent for a term of years to right party. Farm has all the modern improvements, consisting of 2 silos, stone floors (700 yds.), system of waterworks, brick creamery and a private market for all the butter at 25c in Sioux City. Cream separator and a market for cream. My farm of 200 acres lies 6¾ miles south of Sioux City, on the Missouri bottom lands. We have two cottages for help and can handle 40 cows with ease. I wish to rent as my children are too small to assist me in care of farm. A. J. WESTFALL, Sergeants Bluffs, Iowa. 30-2

Guernseys at Auction—I will sell at Public Auction on my farm near Fort Atkinson, Wis., on September 20th, commencing at 10 a. m., 32 head of high grade and registered Guernseys, consisting of 4 registered cows, 8 high grade cows, 10 two-year-old high grades, half coming fresh this fall, 10 grade calves from 1 month to 11 months old, 1 registered bull calf 6 months old, Springer Jr., No. 3926, the head of this herd, will also be sold. This is an excellent lot of well bred grades and full bloods and offers exceptional chance to secure good stock. GEO. D. TELFER. 30-2

Wanted—A thoroughly competent and experienced man to work on a dairy farm. Must understand care and feeding of dairy cows. Also must understand steam and care of separator and all modern dairy utensils. Graduate of some dairy school perferred. For particulars address A. J. DAUGHERTY, Streator, Ill. 29-tf

For Sale—2nd hand U. S. cream separator, No. 5. G. W. SHAW, Allen's Falls, N. Y. 30-2

Wanted—Married man to take charge of 25 cow dairy. S. READ, Bristol, Tenn. 30-2

Wanted—A position by a first-class buttermaker and creamery manager. Twenty years' experience. Best of references. Married. Address C., care HOARD'S DAIRYMAN. 30-2

Wanted—A competent person, with about $1,500, to buy an interest in and run an established dairy, adjoining the city of Baird, Texas. Interest to be only in live stock and dairy outfit and not in the land, of which there is 1000 acres, 200 acres in cultivation and 800 acres pasture, all of which will be rented reasonably. All improvements necessary for first-class dairy. Spring, spring-house, 400-ton silo, barns, corrals, etc. Regular sale for creamery butter, 25c year round; milk 20c per gal. No other dairy. Address at once. W. C. POWELL, Baird, Tex. 29-3

The Best Shooting—The shooting in Iowa, Minnesota and South Dakota this year promises to be very good as the rainfall in all these states was abundant. The best localities for chicken and duck shooting are on and tributary to the lines of the Chicago, Milwaukee & St. Paul Railway. A copy of a recent publication issued by the passenger department of that road can be had on application to Geo. H. Heafford, General Passenger Agent, Chicago, Ill., and enclosing three cents in stamps for postage. 31-2

Excursion Tickets to Walworth County Fair at Elkhorn, Wis., via the North-Western Line, will be sold at reduced rates, September 18 to 22, inclusive, limited to September 23. Apply to agents Chicago & North-Western R'y.

For County Fair, Madison, Wis., the North-Western Line will sell excursion tickets at reduced rates, September 18 to 22, inclusive, limited to September 23, inclusive. Apply to agents Chicago & North-Western R'y.

INFORMATION WANTED.

It is impossible to get too much information regarding the breeding and testing of the dairy cow. Every year brings a new lot of dairymen, and, also, a new crop of calves, which should be fed, milked and bred in a manner to give the largest returns. In many cases the returns will be satisfactory; others, through want of the right kind of knowledge, have not made the success which they anticipated. From both classes much valuable information can be derived; to know where and how one has failed is as valuable, as to know why another was successful. We shall be glad, therefore, if a number of the readers of the DAIRYMAN, and the larger the better, would send us answers to the following questions, taking care to give their failures as well as successes:

1. Have you tested your herd, by weighing the milk and the Babcock test, to find which were the poor cows?
2. How long did you test, and how many did you reject? (Give the whole number of the herd at the beginning of the test.)
3. Is it much trouble or expense to do this, and what plan did you pursue?
4. Have you ever taken a herd of common cows, placed a registered sire at their head, and so kept up the system, until you brought out of it a herd of grade cows?
5. What was the breed you selected, and how much more butter, cheese or milk did you get from the daughters than the original mothers?
6. Would you advise changing breeds, one after another, or breeding right along in the same line?
7. Have you ever bred the daughters back to their own sires, and if so, what was the effect on the health and dairy capacity of the grand daughters?

NOTE—We want as many short, brief answers to the foregoing, from as many different men as possible. Make the answer to each question short as is possible; simply state the facts, not opinions. Do not worry about the style or grammar of your statement. Answer each question by number, and state your experience.

New York Farm and Diary Notes.

How One Dairyman Succeeded.

ED. HOARD'S DAIRYMAN—Some dairymen fail because they do not adapt their methods of farming to the conditions which surround them. In this locality there are farms which grow good grass for pasture, but the land is too wet, or too steep, or too stony to be easily cultivated. To practice successfully the plan of silage, clover, and grain farming, the soil must be easily tillable.

I know one farmer who has made considerable money on a small farm. For many years he has kept a small dairy, ten or fifteen cows I think, and with his plan of farming he certainly has been successful. His farm of about seventy acres lies along a stream in one of the fertile valleys in this section of country.

There are so many springs of water on his farm that much of the land is naturally moist, and the meadows and pastures are productive without any work being done on them. He does not plow his land except an acre or two each year for growing family vegetables, or grain to feed his horse. Nearly all the manure is used for top-dressing the meadows. As he plows but little, he has but little work to do on his farm. In fact about all the work he has done for years is to take care of his cows, and has hired his haying done, for he is now an old man, and able to do but little work. His haying is done very early, and sometimes he is nearly through haying in June, so his hay is the very best quality. Having such good hay, and milking his cows mostly in the summer, he buys but little grain.

He makes butter at home, and makes it only during the summer season. His cows are what I think can be called thoroughbred natives. For many years he has raised the calves from his best cows, until he has bred a herd of cows that average three hundred pounds of butter a year per cow. He keeps no hogs, and raises but two or three calves a year, and feeds nearly all the skim milk to the cows all summer, with a very little grain in it. Every day he carries out a large pailful of skim milk to each cow, and throws a handful of grain in the milk. By doing this, he easily induces all the cows to drink the milk.

If this farmer keeps only ten cows, and makes three hundred pounds of butter from a cow, he makes in a season 3,000 pounds. He makes excellent butter, which I think he can generally sell for twenty cents per pound as the average price for the season. This gives him an income of $600; $100 hires his haying done, buys the little grain he feeds, and pays the running expenses of his little farm. He gets $500 a year for doing chores, milking and feeding his cows. He and his wife require but little for their simple and plain living, and for years this farmer has been laying up money, until he has a good sum at interest, and a competence for his old age.

It will be noticed that the main essentials in his success, have been good cows, a naturally good grass farm, early cut hay, and feeding the skim milk with a little grain to the cows all summer. His farm is so wet and stony, that if he had tried to till it he would have made a mistake, and probably would have made a failure in his business.

A FINE FARMING COUNTRY.

I recently drove through the Ouleout valley, and some observations made along the way may interest your readers. The Ouleout is one of the largest branches of the Susquehanna river in Delaware county; rising in the northern part of the county, in the town of Meredith, it flows through the towns of Franklin and Sidney, and empties into the Susquehanna river near Unadilla. Leaving the Susquehanna river at Unadilla, the road along the Ouleout is so good as to make driving a pleasure. The flats along the stream produce large crops of hay and grain, and the excellent pastures on the hill-sides and the springs which furnish an abundance of the best water, makes this country so well adapted to dairying, which is the main business of the farmers.

In this valley we find some of the best bred herds of Jersey and Guernsey cattle. A farmer remarked to me that their cattle had become so famous that China and the Philippines were asking for Delaware county Jerseys.

The crops in this valley were unusually good. A large hay crop has been stored in good order. Oats were a good crop, yielding on some farms fifty-five bushels per acre. There are many silos here, and the ensilage corn has made a large growth. A large crop of potatoes will be harvested, and low prices are expected. One farmer had been feeding oats and peas to his cows for some time, and his method of growing them, being somewhat unusual, may be of interest.

Unlike most farmers, he does not sow Canada peas, but the marrowfats, or some variety which makes a large growth of vines. These are sown very early in the spring, on rich ground, and plowed in three or four inches deep. Two weeks later the oats are sown and harrowed in.

In this way he obtains a larger growth and more fodder than with the usual way of sowing Canada peas with oats. This farmer owned a fine herd of Jersey's, used a separator, and made butter at home. He could make more money in this way, than by selling milk to the creameries.

The breed of cattle which is now the most favorably regarded in this section of country is the Guernseys. The Guernsey cow as she is bred by these dairymen, seems to possess all the desirable qualities. If the farmer sells milk to the creamery by measure or weight, she gives the quantity of milk which makes her profitable. If he sells milk where he is paid for it according to the butter-fat it contains, the Guernsey is also profitable, for no breed except the Jerseys give milk richer in butter-fat. The Guernsey is thought to possess all the desirable qualities of the Jerseys, while she is larger, stronger, and a more hardy breed.

W. J.

Delaware Co, N. Y.

Col. Robert Ingersoll on "Clover."

The recent death of Col. Ingersoll recalls the beautiful and witty response he made in sending a letter of regret to the Clover Club of Philadelphia:

"A wonderful thing is clover. It makes me think of honey and cream, that is to say, industry and contentment; that is to say, the happy bees in perfumed fields, and at the cottage gate, old Bos, the bountiful, chewing satisfaction's cud, in that blessed twilight that, like a benediction, falls between all toil and sleep.

This clover makes me dream of happy hours, of childhood's rosy cheeks, of dimpled babes, of loving wives and honest men, of springs and brooks and violets, and all there is of painless joy and peaceful human life. A wonderful word is clover. Drop the "c" and you have the happiest of mankind. Take away the "c" and "r" alone and you have the only thing that makes a heaven of this dull and barren earth. Cut off the "r" alone and there remains a warm, deceitful bud that sweetens the breath and keeps the peace in countless homes whose masters frequent clubs. After all, Bottom was right: "Good hay, sweet hay, hath no fellow.'"

Crops for Poultry.

Profitable poultry raising depends, mainly, upon a liberal supply of eggs in winter. Among the desirable or really essential foods for producing eggs in winter are "greens." A daily supply of some kind of green food in winter, in connection with the regular allowance of other food, adds the proper material for the so-called balanced ration. It is not generally understood what an important relation pasturage bears to success in poultry raising. It may be noticed how quickly a flock of hens confined to a yard, will completely denude it of all herbage. Though many notice this, they afterwards wonder why the hens cease to be as productive on the bare yards. Hens will pasture as close as sheep. The very best natural pasturage for poultry, is a well established sod, where native grasses abound, interspersed freely with white clover. A first-class cow pasturage is an ideal place for a poultry pasture.

On farms where business attention is given to poultry, it will pay well to put in crops for both summer pasture and winter use. Good judgment will enable the farmer to readily supply the demands of his flock, and in doing so to greatly increase the ready money income of his farm. Alfalfa is destined soon to be one of the leading crops for poultry pasture. Its wonderful recuperative powers prove it to be just the plant for the purpose. It can be cut several times during a season, for hay making. Poultry can be turned on it, and when it has been eaten down pretty close they may be removed, and the alfalfa will soon be growing again with its usual vigor. This may be repeated the entire season.

Another crop which will become a favorite for pasture raising is rape. The immense quantity that can be grown on an acre will make rape a great favorite, especially where there are bare poultry yards. The large rape leaves are just the "greens" to supply yarded fowls with, and they seem to relish it just as much as they usually do the early cabbage heads they find growing in the gardens. Where it can be had convenient to the poultry yard, crimson clover should be seeded in August, or during the last working of the corn. This will afford a most excellent pasture during the winter, when there is no snow on the ground. This crop will also be highly beneficial to turn under in the spring, to be followed with any crop.

Among the crops desirable for winter feeding when nothing outside is available are rutabagas, mangel wurtzels and turnips. Any of these are good to feed for greens, and can also be boiled, mashed and mixed with the regular allowance of morning mixed food.

Perhaps in the near future there will be regular silos for preserving green cut clover for poultry feeding. It is doubtful, however, whether ensilage, if it has to be fed in the fermenting stage, would prove a safe or desirable food for poultry. Properly cured, cut quite green, clover cut fine and packed dry in bags, will, in time, become a standard product on the markets for poultry.

The sooner farmers recognize the fact that poultry raising should be followed on the same line that dairying is—giving food and care to secure result—the sooner will they begin to reap their share of profits and become competitors with practical poultry raisers. The idea that "anything is good enough for hogs or chickens," is a mistaken one that has anchored many a farmer on the wrong side of the road to profitable farming. Nothing can be attained without effort, and the more practical and intelligent the efforts the greater the success.—G. O. BROWN in *Baltimore Sun.*

(Cap. means separating capacity in lbs. of milk per hour.)

The chart scarcely begins to make plain the actual extent of the practical cheapening of the De Laval machines without further explanation, unless one may have been familiar with the gradual betterment of the machines.

The fairest and most striking illustration of the decade of combined improvement and cheapening of the machines to the separator buyer is to take the "Hollow-Bowl" No. 1 of 1890, which was the first of the "Baby" machines (and given such trade-mark name at the time because it was veritably the "baby" of the separator family and considered a marvel in separator construction), and compare it with the improved "Alpha" disc Baby No. 2 of to-day, *which is its actual counter-part.* The modern "Baby" No. 2 is built to-day upon exactly the same constructural lines as the old No. 1 of 1890. The frames are the same in size, the bowls are of equivalent exterior size, and the necessary speed and essential operating power are exactly the same. The comparison is a direct one.

Note the difference: The "Baby" No. 1 of 1890 had a capacity of 150 lbs. at $125.—. The "Baby" No. 2 of to-day has a capacity of 450 lbs. (*just three times as much*) at the same price. Or take it another way and note the $125.— No. 1 machines of 1890, reduced to $50.— to-day, and without a market even at such much reduced price.

But the comparison only begins in capacity and price. Just as the capacity is three times greater so is the efficiency of the "Alpha" disc machine of to-day three times greater than that of the old "hollow-bowl" one in thoroughness of separation, in permissible variation of separation conditions, and in general practicability. And again in mechanical construction the difference is just as great, both as regards the "hollow-bowl" machine of 1890 as well as the earlier "Alpha" machines of the first few years. Larger and better supply cans, covers and various helpful attachments have naturally developed. Renewable bearings have been made where there was merely the frame casting. Brass and phosphor-bronze bearings have taken the place of cast-iron ones. The best of adjustable sight-feed oil cups have taken the place of plain brass wick-feeding ones. The latest devised and patented radial spring top-bearing has replaced the rubber-ring style of such bearing. Substantial supporting iron stools are now a part of the machine, where no stool at all was furnished before. Gears and spindles are protected by shields, and every device added that years of practical use has suggested. The frames are symmetrically designed, and every feature of mechanical construction has become the best that twenty years of experience can devise or money can make it. The finish is japanned enamel, with handsome decorations. The test of every part in every machine and finally of the assembled machine itself is thorough and complete, with the best possible facilities for such work.

Of course most of these improvements have been possible only through the invention and further development of the Alpha "disc" process of separation, used exclusively in the De Laval machines, and the "Alpha" disc system is the keystone of all modern separator improvements—the very heart and soul of the perfect cream separator.

For complete details, cuts and general descriptive information relative to centrifugal separation generally, and the Improved "Alpha" Baby Separators particularly, see the De Laval "Dairy" catalogue, a copy of which may be had for the asking.

The Babcock Test: Its Origin, Use and Manipulation.

ED. HOARD'S DAIRYMAN:—A wonderful advance has been made in the science and art of dairy practice during the past twenty-five years. This is in a great measure due to the invention and use of improved dairy machinery. Among these many inventions, none save the cream separator has proved of greater moment to those interested in the many phases of dairy husbandry than the Babcock test.

The specific use of this machine is to determine the amount of fat present in the several products of the dairy. It was long since recognized that the amount of fat present in the milk, whether for home consumption or the manufacture of butter and cheese, was a just measure of its value. At that time it was only possible to discover the per cent of fat present in milk, etc., by means of expensive and complicated chemical analyses. It is thus apparent that there was an urgent demand for a machine simple in operation, and that would quickly and economically determine the actual fat present in dairy products. After many futile efforts on the part of other investigators, Dr. Babcock, chemist of the Wisconsin Experiment Station, succeeded in perfecting a test having the desirable requisites.

The necessity for the use of such a test on every farm where dairying or dairy products are of any moment, will be quickly apparent to any student of the dairy situation. In Tennessee this need is particularly urgent. Nature has endowed our state with those physiographical conditions essential for the successful conduct of dairy enterprises. The present cry is for greater diversification. Surely here is a chance. Our state is annually spending hundreds of thousands of dollars in purchasing the adulterated and cast-off products that our sister states desire to put off on us at exorbitant prices, while the great and profitable dairy industry we should possess, remains practically undeveloped. Should any one be pessimistic regarding the virtue of dairy enterprises it will only be necessary to call to their attention the marvelous progress witnessed in those states of the Union where these interests are predominant. Surely, we in Tennessee, possessed of a more salubrious climate and a greater variety of cheaper food products, can emulate their example with profit to our souls.

Let us now investigate why we should use the Babcock test more generally on the farm and in what way it will aid in the upbuilding of our dairy interests.

1. Cows vary as to the cost of keep.

2. Cows vary as to the amount of milk and butter yielded.

3. Cows vary as to the length of lactation periods.

4. Cows vary as to the value of a specific purpose.

It is thus necessary to keep a record of the milk and fat yielded by every cow in the herd, so that the unprofitable ones may be disposed of before they leaven the whole lump. It is undoubtedly true that many failures in dairying are the result of ignorance of the individual merit of the several cows composing the herd. Those who desire to learn more on this subject are recommended to write to the Tennessee Experiment Station, and secure a copy of Bulletin No. 47, bearing on this and related subjects of interest to dairymen. In reviewing some of the records of our cows I find the following examples that will satisfactorily illustrate some of the points considered in the previous discussion:

No. 317, a Holstein grade, weighing 903.5 pounds, produced 7,007 pounds of milk, worth $175.17, at 2½c per pound, or 327 pounds of butter, worth $81.75, at twenty-five cents per pound, in one lactation period of 273 days; while 405, a Jersey grade, under similar conditions as to food and treatment, and weighing 857.7 pounds, made 7,764 pounds of milk, worth $194.10, or 371.4 pounds of butter, worth $92.85, a difference of $18.93 for milk and $11.10 for butter in favor of the latter cow.

Again, in the cases of 545 and 438, the former gave milk worth $108.42, and butter valued at $56.92; the latter, milk worth $141.60, and butter valued at $54.52; while 115 and 323 yielded milk worth $81.42 and $81.85, and butter valued at $38.95 and $52.52, respectively.

With a herd of eighteen cows, the lactation periods ranged between 195 and 427 days; the average daily milk yield from 10.4 to 26 pounds; the per cent of fat in the milk from 117 to 371.4 pounds, and the average daily yield of butter from .51 to 1.24 pounds. The differences between the maximum and minimum yield per cow, were in the case of milk, 4,762 pounds, or a money value of $119.05. When butter is considered the difference is seen to be 254.4 pounds, representing a money value of $63.60.

These statements demonstrate why a record of the dairy herd is essential to success. A record may be easily and cheaply kept by the use of a pair of scales and a Babcock tester. The outlay entailed will be doubly repaid in the economy of feeding secured, and the accurate knowledge ascertained regarding the individual merit of every animal composing the herd. The test as described further on may be secured from any dairy supply company. The cost varies from $2.50 to $50.00, according to the size and style of machine purchased.

Below are appended a set of explanatory rules governing the operation of the test that will enable anyone studying them to successfully handle it:

1. The bottles used in the test should be made of annealed glass and should contain, when filled to the neck, not less than 40 c. c.

2. The scale on the neck of the milk bottle reads as high as 10%. Five divisions equal one per cent and each division equals two-tenths of a per cent.

3. All bottles used must be numbered, corresponding with the ear tag number of the cow. When buying bottles see that there is a "ground" area on the shoulder of the bottle for marking on with an ordinary lead pencil.

4. The measuring pipette should have a wide opening at the bottom end and when filled to the mark contain exactly 17.6 c. c., or eighteen grams. The shaft of the pipette above the mark should be long. There will then be little danger of drawing the substances to be measured, into the mouth.

5. The machines should make from 600 to 1,500 revolutions per minute, according to the size and style used.

a. Three styles of machines are manufactured, namely:

1. Hand.
2. Belt or friction.
3. Steam turbines.

b. The hand testers require the highest speed; the friction about 800 to 1,000, and the turbine 600 to 700 revolutions per minute.

c. The speed of the turbine is determined by an indicator. The speed of the other styles must be calculated from the diameter of the gearing wheels.

d. Where much testing is to be done, the turbine is the best as it gives uniform speed, maintains the fat in a liquid state, requires the least labor, and gives the most accurate returns. When twenty to forty or more cows are to be tested regularly, the turbine should be used and for less than twenty, the other styles will answer very well.

6. Commercial sulphuric acid having a specific gravity of 1.82 to 1.83 is required.

This acid should be kept in tightly stoppered bottles to prevent the absorption of moisture from the air which weakens it. It must be handled with the greatest care as it destroys clothing and burns the skin very severely. To counteract its effects dip the part in cold water or neutralize by the use of ammonia. The action of the acid is

a. To cut the curd.
b. To liberate the fat.
c. To raise the temperature.
d. To act on the milk sugar and color it a golden brown.

7. It takes just 17. 5 c. c. of acid having a specific gravity of 1.82 to 1.83 to dissolve the curd and liberate the fat of normal milk. When skim milk, buttermilk, etc., are tested by means of the old style bottles, a double charge of acid is required. As whey contains but little curdy matter, use less acid with it. Many convenient devices are now made for quickly and accurately measuring the amount of acid. Of these the "combined" acid bottle is probably the most convenient. An acid jar with a mark on the side is commonly used. The amount of acid required to give a clear test, will vary with the temperature of the milk and acid, (both should be at a temperature of 70° to 75° F.), the temperature of the room, etc. In cold weather use a little more acid, and in warm not quite so much may be needed. If there are white specks in the fat column, the acid is too weak—use a little more or warm the milk; if black specks are present use less (the acid is too strong and chars the fat) or else cool the milk. Never tamper with the acid.

8. Water, having a temperature of 150° to 170° F., should be used for filling the bottles up to the 8% mark. If the fat column becomes chilled, it will be necessary to set the bottles in a pan of hot water to liquify the fat before the reading can be made.

9. It is necessary that a representative sample of the milk be secured for making the test.

a. This may be done by pouring the milk from one vessel to another, gently but rapidly, several times, so as not to make froth or

Registered Jerseys.
Herd headed by two of the best bulls in the state. No cows used for breeding that will not make 14 lbs. per week. Young bulls and heifers at reasonable prices. Address, J. F. EGERTON, Footville, Wis.

St. Lambert Jerseys, all ages, both sexes. Some from tested cows at low prices. W. J. HUSSEY, Mt. Pleasant, Ohio.

Very handsome . . . Send For Pedigree. **$50.** J. P. BRADBURY Pomeroy, Ohio

foam, and quickly measure out the desired amount.

b. The above method must be followed when sampling cream, skim milk, buttermilk, or the separator bowl slop.

c. Sour products, partially churned milk or dried cream, can not be accurately sampled.

d. It is absolutely necessary that the samples be uniform in size from each milking, or an aliquot portion of the product to be tested.

10. The sample to be tested must be accurately measured because of the small portion taken.

11. When the acid is added to the milk, incline the bottle and the pipette so as to allow the air to escape. This will prevent "bubbling over" the mouth of the bottle.

a. The same caution must be observed in putting the milk, etc., into the bottles.

b. The mouth of the pipette should just rest inside that of the test bottle.

12. Mix the acid and milk thoroughly by means of a rotary motion. See that the mouth of the test bottle is pointing away from the face.

13. The bottles should be whirled as soon as the mixing is completed and continue for five minutes. An even number of bottles must always be whirled at the same time.

a. The Babcock test is a small centrifugal machine, i. e., throwing or pulling away from the center.

b. The specific gravity of milk fat, when compared with unity, is .93; of the water of milk 1; of the solids of milk, other than the fat, 1.6; of ordinary mixed cows' milk, 1.03; and of the acid used in making the test, 1.82 to 1.83.

c. The above makes it clear then, why rapid whirling in a centrifugal machine causes the substances, other than the fat, to sink to the bottom of the test bottle, and the fat to float on top, and which, on the addition of warm water rises up into the neck of the bottle and can be easily read off on the scale.

14. At the expiration of five minutes, fill the bottom to the zero mark with water, as already directed, and whirl again for three minutes. Then fill to the 8% mark and whirl again for two minutes. The fat should be read at a temperature of 140° to 170° F.

15. In making the reading, hold the bottle perpendicularly on a level with the eye. The readings are made from the highest to the lowest levels of the fat columns.

16. Owing to the small amount of fat in skim milk, buttermilk and whey, special bottles holding twice the usual amount, or 35.2 c. c. are used. Ten divisions on the scale of these bottles represents one per cent.

Two other styles of bottles are now made for testing the above products, namely, the Ohlsen's and Wagner's. They have double necks and are so finely graduated that even traces of fat can be detected. Only a single sample of milk and a single charge of acid are used, but they are too expensive yet for common use.

17. To test cream, use 18 c. c. and a special bottle with a wide neck graduated to read 30%.

a. Cream containing over 30% of fat may be tested by taking 9 c. c. of cream, adding 9 c. c. of water and proceeding as for ordinary milk, or 6.04 c. c. of cream may be taken and two (12.08 c. c.) charges of water. In the former instance multiply the fat by 2 and in the latter by 3.

18. To test condensed milk, weigh 8 grams into a test bottle, add 10 c. c. of water and proceed as for whole milk. To obtain the per cent of fat, multiply the reading by 18 and divide by 8.

19. To test cheese, secure a finely divided sample by mixing portions from near the edges and the middle. Weigh 5 grams into a test bottle and add 12 to 15 c. c. of hot water, shake, cool, and proceed as previously directed. The per cent of fat is found by multiplying by 18 and dividing by 5.

20. The composite test now so commonly used is made just the same as with whole milk. By means of this test much labor and expense are saved as in the case of large herds and in cheese and butter factories it is only necessary to test from once a week to once a month. Pint or quart jars with adjustable tops are used for holding the samples. Into each one is placed a corrosive sublimate tablet, varying in size with the length of time the sample is to be kept. After mixing the products to be sampled as already directed, measure out a fluid ounce from each milking and put in the above described jars. Keep the jars in a cool place and shake gently on the addition of each fresh sample. Do not churn the samples by too violent agitation. As corrosive sublimate is a deadly poison great care must be exercised in making the test and washing the bottles. Do not wash them in connection with any other dairy utensils and be especially careful about the disposal of the waste products.

21. Only pure well or rain water should be used for filling the bottles, etc. Rain water is preferable as it contains comparatively little mineral water. Mineral water, especially lime, causes foam on the top of the sample and renders an accurate reading impossible.

22. Testing should be done quickly and quietly as the accuracy of the results depend upon the skill and thoroughness with which the operator does his work.

23. As soon as the reading is made the contents of the bottles should be emptied in a crock kept for that purpose and thrown out on the ground where no animals can reach it. This waste will corrode tin piping and wash sinks, etc. It is well to bear this in mind.

24. To wash the test bottles and sample jars, first rinse out with hot water several times. This water is conveniently supplied from the tank used to fill the bottles when making the test. If the fat does not readily clear from the bottle use a little sal soda. If the bottles become black or cloudy add a few drops of sulphuric acid. If this does not prove successful put a few shot in the bottle and cork and shake thoroughly. A bottle is clean when the glass is clear and there is no greasy feeling to the touch.

25. A proper sample is a clear yellowish brown liquid oil or butter fat.

ANDREW M. SOULE, Agriculturist.
University of Tennessee.

WHAT THE FLIES CAUSE.

Two Million Gallons of Milk Short Every Day.

Yes, two million gallons of milk more could be made in the United States daily than is made, if it were not for the little pestiferous flies. Bosh! some will say who read this; but let us see—figures don't lie, no never. There are in round numbers 8,000,000 cows in the United States being milked at the present time, and no one of experience will say but what each cow, on the average would give a quart more milk per day if it was not for her being tormented by the flies. We thus find we would have 8,000,000 quarts or 2,000,000 gallons, worth at the present price of milk wholesale, $170,000, as a daily loss to the farmers who are keeping cows for dairy purposes. These figures are enormous. Let us bring this down a little finer; yes, bring it right down to the farmer who only keeps five or ten cows. Ten quarts of milk short means a loss of twenty cents daily, or $6 per month. True it would not break a farmer down, but it is the little leaks on the farm that does in the end produce a sheriff sale. And this is one of them; and it becomes each and everyone, no matter what their line of business, to stop the little leaks. We are living in an age when this must be done, or the business will go to the wall sooner or later. But what about the fly leak? How stop it? Yes, stop it, and do it cheaply and with no great outlay of strength. There are a great many elements that are safe to handle, and their cost is but little, that will either kill flies outright, or when properly used, keep flies from tormenting cattle scarcely at all. Common kerosene will actually kill some of the flies if they are drenched with it. Crude petroleum is better, for the reason that it is not as volatile and will last longer when applied to the cow. But better still is a mixture of equal parts of fish oil and crude petroleum. Any of the carbolic sheep dips that are prepared and put on the market, when diluted with an equal amount of water, and applied as hereafter directed, will practically keep the flies from doing any serious damage. Also will the various agents put up as fly preventives and sold to the general public. They will not, any of them, do all that is sometimes claimed they will do. This is no idle theory of mine, but I am giving the results of personal experimentation of the elements I speak of. It is idle to talk that any remedy can be put on the animal once per week, that will keep the flies away; yet that remedy may be a good one when properly used. Kerosene is good, as I said before, but it is unsafe to pour it on or apply with a brush, as its irritating properties injure the animal; again, it too soon evaporates and when applied to a cow and when she is turned in the pasture, it is gone in an hour's time. It is, however, a grand element to use in the stable to kill flies outright with. The cow comes in covered with flies; with a small tin, zinc or copper spray pump (the tin ones only costing from 50 to 75 cents), spray the cow. These pumps will throw a fine spray from two to three feet in diameter and the spray is thrown so quickly and so fine is it that even the flies can't get away from it in large numbers, and a large number will be so drenched that they will soon go to a flies' hereafter; and there is no danger of enough kerosene getting on the cow to injure her at all. But I much prefer any of the other preparations spoken of, for they last so much longer and will as effectually kill a fly when it touches them. The expense in either case is trifling, even if the patent kill-flies or shoo-flies are used, when applied as a spray, and I firmly believe that it is the only true way to apply any of them. A teaspoonful will effectually put a spray drop on every hair of a cow, and can be put on with a pump in less than thirty seconds, when the cows are in the stable. It will thus be seen that a gallon costing $1 will do an immense amount of spraying if used every morning. This is what I have done, and the result is in one week's time I have reduced the number of flies in my cow stable over one-half. The milking is done in comfort to the milker, and when the cows are turned to pasture there is scarcely a switch of the tail or stamp of the foot. Now, all this was the result of thoroughly spraying the animal every morning with one of the carbolic sheep dips, reduced one-half with water. When I say thorough I mean simply enough to make the hair just moist, not drenched nor wet enough to moisten the skin. Applied in this way a teaspoonful will do it all. Don't use a sprinkling pot nor a brush; nor think you can just as well apply it in some other way, for you can't do it. But get the pump and do it just as I advise, and you will kill off half the flies and prevent the balance doing you or your cattle any harm. Yes, I use it on my horses to some extent. But when driven in the dust it sticks to the hair. That is the objection, so I spray it on the legs and use nets on the body.—*Practical Farmer.*

LADY BAKER

Is the sixth highest butter cow in Holstein history. Her butter record is 34 lbs 6oz in seven days, the second largest record of the breed in the advanced registry. Her milk record is 773¼ lbs. in one day. Lady Baker sold for $800 at Mr. Wales auction sale, held at Chicago in 1889. Valley Mead Farm is in a position to give the blood of this great cow from her only son Judge Baker, who sold for $600 to Colo. A grandson of Lady Baker, called Sir Natsey Baker, stands at head of herd.

Northern New York Pencillings.

Summer Drouth and Cow Feed.—Corn Crop in Northern New York.—New York Fairs and Dairy Products.—New Silo Hints.

ED. HOARD'S DAIRYMAN:—At this writing, September 1st, a light rain is falling, but the outlook is not promising. Not enough has yet fallen to more than lay the dust, and the chances are that old Sol will hold the boards in another hot "season" before he reaches the meridian to-day. Less than half an inch of rain has fallen here since July 15th; the mercury meanwhile, or since August 1st, being encamped close to the 90° outposts.

The effect on the milk yield has been terribly destructive, it having fallen off nearly one-half from the flush.

Our best dairymen are feeding their cows hay and grain, and those having silos are feeding the corn that ought to have found asylum therein. Other dairymen are allowing their cows to shirk for themselves, and are saving the remnant of their corn crop, if one may so call it, for winter feeding.

For the first time in more than two decades, old Ellisburgh's corn crop will be nearly a total failure. There are, here and there, a few fields which promise a half crop or more, but they were planted early, say, May 10th. But those farmers, who begin plowing before the frost is out of the ground, but do not plant till the middle of June, are drowned in the soup, as are those farmers, who plowed their early mown meadows, and planted corn thereon. Such corn will never reach the silk stage, and much of it will not tassel, even. But they took their chances, which were "agin" them, from the beginning of July, almost.

All indications pointed to a dry season at that time, and if those farmers had left their meadows unplowed, many of them would have yielded a fair crop of aftermath, that would have now been ready for the mower. Indeed, many of those early mown meadows that were left unplowed, now show nearly, or quite, a ton to the acre; and this, if cut and secured at once, will make excellent hay.

The Jefferson County fair closes to-day. The crowds have been large so far, and, as this is "Roosevelt Day," his excellency being booked for a talk from the grand stand, many people will go, despite the unfavorable weather outlook. But, like the majority of our fairs, now-a-days, many of its exhibits are minus; trotting races, fakirs, and other so-called "attractions," having taken the places of the old time exhibits.

The show of dairy stock was small, while that of dairy products, i.e., butter and cheese, was not worthy the name. Less than a dozen cheese, and not more than as many packages of butter were in place in the department allotted to the dairy, in the general purpose building. What a travesty for this great dairy county, with its 50,000 cows.

In 1896, this county had 110 cheese factories, and fourteen others at which butter, or both butter and cheese were made. These 124 factories produced, that year, 342,102 pounds of butter and 10,629,009 pounds of cheese, the most cheese of any county in the state; St. Lawrence County, with nearly or quite 20,000 more cows, producing 10,059,008 pounds of cheese; but while Jefferson County factories produced but 342,102 pounds of butter, those of St. Lawrence turned out 5,953,616 pounds, showing that the butter dairy cuts but little ice in *this* county, and that mostly in winter.

In view of this showing, there ought to have been an exhibit of at least 100 boxes of cheese, and fully as many packages of butter, at the fair, instead of the two abortions there seen. But, so long as the premiums offered are so insignificant as not to warrant the expense of making an exhibit, should one be so fortunate as to win a prize, no exhibit worth the name, will be made at our fair.

Of course, the high price of both butter and cheese has taken the merchantable goods nearly all out of the county; but there ought to have been a cheese or two left at each factory for exhibition purposes at the fair. They would have sold in the local markets or on the fair grounds, for more than they did on the board of trade. So long, however, as the bulk of the gate receipts go to the "hoss trot" sharks and the proprietors of fake attractions, no better exhibits of dairy products will be seen on the grounds, and it is only a question of time, should the present policy obtain, when none at all will be in place.

There was a prize offered for the milk containing the most butter fat from three cows of different breeds, for two days. There were three entries, and August 30–31 were the days selected. There were three competing herds, viz., J. F. Converse & Co's, Woodville Ayrshires, and Smather & Sons, Henderson, and J.W. Overton & Sons Belleville Holsteins. Following is the score:

Converse & Co.'s Ayrshires, 115 pounds of milk, 3.3% fat; Mather's Holsteins, 130 pounds milk, 3.5% fat; Overton's Holsteins, 111 pounds of milk, 3.7% fat.

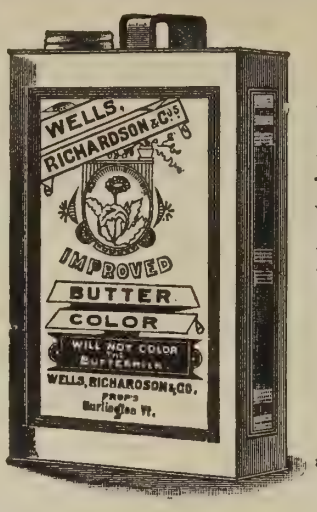
Mr. W. E. Griffith's name was added to the report, as inspector. No details as to feed or cost, etc., were given; only results as above.

There were three herds of Jerseys, one of Short-horns, one of Ayrshires, two of grade Ayrshires, one of grade Devons, one thoroughbred and one grade Guernsey, one Holstein and one thoroughbred and one grade Brown Swiss. There was also an exhibit of oxen and one of fat cattle. Mr. Henry Van Dreser, the noted expert and judge of dairy cattle, and high on the farmer's institute roll of fame, presided as judge. He also adjudged the very large and excellent exhibit of poultry, a part of which was from the state of Delaware.

It was the feature of the fair, being the only really full exhibit in any department of farm stock.



Before the advent of the long drouth, preparations were made and material purchased for the building of a half dozen silos in the vicinity of Belleville, and others were in contemplation. Those built are of the round form and of "stave" status. Mr. W. R. Walch, of Belleville, claims a new modus for the stave silo. He uses for 15 feet diameter, four 4×6 pieces; the others are 2×6, best pine, brought to a thickness, planed on one side and grooved and tongued on a bevel.

The 4×6 pieces are also grooved, so as to have the stave tongues come fair, thus making the inside of the silo perfectly smooth, and leaving an outside projection of the posts or 4×6 pieces, of four inches. Through these, at proper intervals, round ⅝ rods are run, being hooked where the joints come and tightened with a nut at one end only.

As many of these round rod hoops may be used as are needed, and may be tightened or relaxed at any time. The four posts are placed equal distance from each other, and, as everything comes from the mill, all fitted. One of this form of silo is easily and rapidly set up, while the cost, at the price charged here for material, is but $90 for a silo of 150 tons capacity.

The roof may be of the form and material to suit one's means and tastes, and the doors placed conveniently apart, as in other forms of silos.

How many generations will come and go, ere this silo problem is satisfactorily solved to every body concerned? During the last nine

winters I have heard silo and silage talk "to beat the band," and had thought that the subject had about been talked to death.

I was off on my figures, as I find that hardly any two silage feeders agree as to when to cut and how best to store it. One man says: "Don't cover silage at all; begin feeding it the next day after the pit is full." Another man says: "Cover it; sow oats on the top of the silage, wet down the mass, and allow the oats to grow and form an air tight blanket." Another man says: "Shred the stalks; they make better silage than do cut stalks." Another man says: "Don't cut or shred the stalks; put them in whole." One man says: "Cut the corn just as it begins to glaze." Another one says: "Wait till it is ripe enough to cut for grain, then wet down the silage thoroughly, when it goes into the pit." One man says: "Pick off half the ears if there are more than one hundred bushels per acre." Another man says: "Don't you do it; put all in; feed less, and balance it with clover hay and bran," and so on to the end.

I incline to the belief that one should cut the corn, if every crop is to be fed on the farm, when it has its greatest value, and which is, according to the Cornell report, when it has arrived at the glazing stage.

I have heard John Gould and other experts say, and have read in bulletins the statement, that a stalk of corn containing one well developed and fully grown ear, had a unit feeding value of fifty-five for the stalk, as against forty-five for the ear, and that 60% of that stalk value was below the ear, which was as much as to say, save that part of the stalk, sure.

It is the part we see going to waste on every farm, where corn fodder is fed in the old way. But you cannot afford such a luxury. Save it all, by cutting when in the glazing stage, and covering it up air tight in the silo. As a rule, I think this plan is followed by our dairymen of longest experience in feeding silage. But here comes Mr. Fred Greendy, who writes this in *Farm and Fireside*: "The lower end of the stalk contains so little nutriment, that it is not worth handling; therefore, it is advisable to cut, at least, a foot above the ground, and if the growth is rank and the stalk large and heavy, I would cut eighteen to twenty-four inches above the ground. By doing so, one gets all the stalk that is of value for feed, while he leaves the hard woody part in the field."

This advice is for those farmers who cut their corn, shock and husk it in the old way, and feed the grain and stalks separately; but what advice it is. He says: "These long stumps can be smashed down with a heavy pole when the ground is frozen, and turned under next spring." That pole smashing, and eighteen to twenty-four-inch cut above the ground, are new features I have never heard advanced before. Have you?

Belleville, N. Y. C. W. JENNINGS.

OLEO AND BUTTER.

Writing on the question of the ten-cent tax on colored oleomargarine the Cincinnati *Tribune* says:

A movement is on foot to have a tax of ten cents a pound placed upon colored oleomargarine. The advocates of the bill claim that the revenues of the government would be materially increased. The opponents of the bill claim that it would simply legalize a fraud.

Uncolored oleomargarine now pays a tax of two cents a pound, and is a legitimate article of commerce in every state. As the uncolored has no resemblance to butter, the dairy interests pay but little attention to it. Their interests are not affected. But as to colored oleomargarine, its sale is prohibited in thirty-one states, to wit: Maine, New Hampshire, Vermont, Massachusetts, Rhode Island, Connecticut, New York, New Jersey, Pennsylvania, Delaware, Maryland, Virginia, West Virginia, South Carolina, Georgia, Alabama, Tennessee, Kentucky, Ohio, Wisconsin, Illinois, Minnesota, Iowa, Missouri, North Dakota, South Dakota, Nebraska, Colorado, Utah, California and Washington. In these states the prohibition was put on to protect the farmers and dairy interests, and to guarantee pure butter to consumers. Any law passed by Congress, that places a tax upon colored oleomargarine, recognizes that product as legitimate, and, it is claimed, nullifies the prohibitive laws of all of these states.

It would seem that a tax of ten cents a pound should be sufficiently protective to the dairy interests, but they fear not. In another way, though, they can be fully protected.

If the law is so framed that the manufacturers are required to pack every pound of oleomargarine in a wrapper of certain kind, bearing the ten-cent stamp, stamped in large letters "oleomargarine," and that the goods should not be sold, except in that form, just as smoking tobacco is sold, the farmers would have no occasion to complain. Then every purchaser would know just what he is getting, and the rival of butter would be compelled to make its fight with its face exposed.

On the other hand, let us hope that the substitute for butter will compel every farmer's wife to study the way to make good dairy butter. The trouble now is not the price of butter, but the quality. Good dairy butter is worth as much as creamery, and some sells at higher prices. But in the grass season the markets of big cities are absolutely burdened with tons upon tons of dairy butter, that sells at prices ranging from ten cents or less, to fifteen cents, when, if it were properly made and packed, it would sell at prices not materially lower than good creamery. The law to tax oleomargarine will not hurt the farmer who makes good butter. It will help him, and, if it creates good butter makers of others, all will gain by the tax.

The *Tribune* is wrong in its assumption that uncolored oleomargarine, alone, is now taxed two cents a pound. The tax law pays no attention to the fact whether it is colored or not, but taxes it the same in both conditions. Therefore, the *Tribune's* argument that taxing the colored article two cents a pound would "recognize that product as legitimate," and nullify all the laws of the states which prohibits its sale in colored form, falls to the ground of its own weight. The United States taxes the present article, colored or uncolored, two cents a pound. The United States Supreme Court has upheld the right of the states to forbid the sale of oleomargarine in the yellow color of butter.

A tax of two cents or ten cents is the same in principle, and the latter would be just as constitutional, from a national stand point, as the former.

The United States government possesses the right of unlimited taxation of any article. It has the right to tax to extinction, as was done with the State Banks.

Poor Milk —Good Butter

Do all your patrons bring absolutely perfect milk? If not, you can't get perfect results unless you have a Pasteurizer. Pasteurization overcomes the effects of careless handling of milk and careless cleaning of cans and utensils. It removes all danger of bacteria; improves the quality of the cream and of the butter made from it, and makes both keep longer. The

REID Pasteurizer

affords scientific, practical and most economical means of pasteurizing whole milk, skim milk or cream. The Reid Long Spindle Separator Book or our new Illustrated Catalogue mailed free.

30th and MARKET STS., PHILADELPHIA, PA.
and CEDAR RAPIDS, IOWA.

WELL FIRED.

In its "Fired at Random" shots the Creamery Journal says: "There are still a surprising number of creameries that do not use the Babcock test, and pay for milk by the hundred. Such creameries are on a par with farms where sharp sticks are used for plows."

It is amazing how contentedly a great lot of men go along year after year, doing business in the most wasteful, unprofitable and slip shod manner. When Gabriel blows his trumpet it is extremely doubtful if they will hear it, having never heard of it.

SCIENTIFIC PRODUCTION OF MILK.

Modern Methods of Caring for it.—Growing Business at Eight Cents Per Quart.

Persons riding in the electric cars from Boston to Norumbega Park have noticed a large, new barn on the right, soon after crossing the Newton line. But those who passed without stopping, can have little idea of the character of the business carried on here, even though told that it is a milk farm. I have visited many milk farms, but never one that equaled "Wauwinet Farm" in magnitude and character of product, and though it has been noticed before in the *New England Farmer*, a description of it will bear repetition for the valuable hints.

The owner, Mr. Geo. H. Ellis, is a Boston printer and publisher doing a large and successful business. From a boy he has had a strong leaning towards rural life, and like many other business men, has a firmer faith in farming when intelligently managed, than many farmers have, who know no other occupation. Mr. Ellis began his farming operations here eight years ago with a herd of four cows. Besides supplying his own family with dairy products, he sold sixteen quarts of milk a day to neighboring families. Without any advertising or soliciting trade, sales have increased till at present 1,600 quarts of milk and twenty-five quarts of cream are made and sold daily to customers in the vicinity.

To produce this, over two hundred and fifty cows are kept, mostly Jerseys and Jersey grades, with a sprinkling of Guernseys. The best calves are raised, so that the entire herd numbers about three hundred animals. Eight hundred acres of land are used in furnishing food for the herd, part of the land being leased. On the home farm of twenty-five acres, is scarcely more than an exercise yard for the animals in pleasant weather. Here stall-feeding or the "soiling" system is a necessity, but on the other two farms, one five miles away, and the other twice that distance or more, there are some pasture lands, mostly on the latter where the dry cows and young stock are kept.

These long distances materially increase the cost of production, but Mr. Ellis reduces it as much as possible. All cows in full flow are kept at the home farm, those drying off at the one five miles away. When manure is hauled from the home farm, fodder is hauled back, so men and teams work both ways. The same economy is practiced in changing cows from one farm to another. When half a dozen at the home farm are past full flow, they are loaded upon a large van and drawn to the middle farm, where they are exchanged for the same number of dry ones, which are carried to the remoter farm, and there exchanged for a load of those that are fresh in milk, or soon to be so. These are brought back to the home farm, the trip being made in a day.

There are three barns at the home farm, the largest being a one-story building, without cellar, 127 feet long by 85 feet wide. Nearly one hundred cows are kept here, each in a pen 7×9 feet without floor, and with no arrangement for tying. About four inches of sand are spread evenly over the earth, and upon this a good layer of sawdust or shavings. The cows are fed in hinged troughs, which, when not in use are turned up outside the pen so they never become soiled. Water is within reach of each animal at all times. The daily droppings, together with what bedding is unfit for further use, are collected daily in an iron cart, which is drawn upon a platform, where it can be dumped into a four horse wagon. When this is filled it is hauled to fields where needed, the return trip, as previously stated, being with a load of fodder.

At present, sweet corn stalks, from which the ears have been sold, on farms of neighbors, is the principal coarse food, all being run through an ensilage cutter.

Green rye, wheat, and peas and oats grown together are liberally fed in the early part of the season, but green corn stalks form the base of the summer feeding. In winter, each cow gets about thirty-five pounds of ensilage, and at times this is also fed in summer. There are several large silos on the different farms, built of plank staves, part of them without roof or floor, other than the earth in its natural condition. Mr. Ellis finds that the contents keep as well as in more expensive silos. Eight to ten pounds of mixed grain, always dry, is fed daily to each cow.

The most remarkable feature of the establishment is the way the milk is handled. The cows are kept clean by clean bedding and daily grooming. Each milker milks fifteen cows and when milking wears a suit of white duck. The milk of each cow is weighed and the weight recorded. It is then carried to a room at the end of the stable enclosed with fly screen sides; inside an attendant stands to strain the milk which runs through a short pipe into the cooling and bottling room adjoining. This arrangement takes the milk out of the stable air as fast as drawn. In the bottling room it is run over a combined aerator and cooler, made of corrugated copper sheets through which is forced a continuous stream of cold brine from a refrigerating machine. Less than a minute is required for changing the temperature of milk from 96° to 36° F. It would be possible to force the brine through fast enough to freeze the milk. Indeed frost constantly stands on the pipes for carrying the brine.

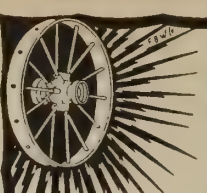
As the milk falls from the cooler it passes through fine strainer cloth into a tin-lined copper tank on rollers.

Under the tank is a table upon which bottles are placed close together in rows of eight and as the tank is moved along the bottles are filled, a row at a time, through automatic valves with scarcely a drop of milk wasted. The bottles are sealed with paper caps that will not absorb moisture or allow leakage.

A 13-horse power gasoline engine not only runs the machinery in the refrigerating plant but also a ten horse power dynamo which furnishes electric light for the buildings in the home farm and a seven-horse power motor used in cutting ensilage and other fodder. Formerly the cutting was done by horse power but now the treadmill is used only for exercising the bulls, a practice that tends to keep them healthy and quiet in disposition.

Sixteen to twenty horses are required to do the teaming and about forty men have their names on the monthly pay roll. The milking begins at four o'clock in the morning and at three in the afternoon, and occupies about two hours. Four low down wagons are used for delivering the milk. The delivery is made morning and afternoon, some customers receiving their supply within an hour after it is drawn from the cow.

The price received is eight cents a quart and the demand has required a continuous increase in the size of the herd. Though eight cents is more than customers had been paying to other milkmen, yet the amount taken has increased, showing that an intelligent public would use more milk than at present if the quality were such as to give full confidence in it. Mr. Ellis does not believe that it is necessary to pasteurize milk if it is properly made from healthy cows, is promptly aerated and cooled, and then delivered in perfectly clean bottles.



One of his neighbors doing business in Boston recently took his family into the country for a vacation, where he had presumed that good milk for an infant would be easily procurable. The child not doing well on the country milk the father ordered a supply to be sent daily from Wauwinet farm, and though a day old when used it had restored the baby to its accustomed health.

With this large investment of capital and great running expenses, it seemed not an impertinent question to ask if it paid. The reply was: "I cannot expect much profit this year with such a drought as we have had, acres and acres of peas, oats and other crops unable to grow for lack of moisture in the soil." Much food that it was expected would be grown on the farm will have to be purchased. Doubtless some of the neighbors suppose that Mr. Ellis is farming for fun, but he says there is no fun in it for him unless it does pay. He is aware that making milk at going rates has not been satisfactory to producers generally, and that the system is not without its faults, some of which he has eliminated in his own practice. One of the greatest wastes in the business is in the cost of selling, even in villages where farmers peddle their own milk. There is too much running across one another's route, often every milkman in town going through each street to accommodate only a few families. Mr. Ellis' milk has become so popular that he is able in some cases to supply every family on a street. His trade is quite compact, the farthest customer being scarcely four miles away in a territory taking from him milk and cream equivalent to 1,800 quarts of milk a day.

Mr. Ellis believes that there is a brighter day ahead for stock husbandry, that beef making is again to become profitable in the east and that it will be entered into by farmers at some distance from the large markets so that the nearby farmers will have a better demand for milk. The public is also becoming more particular about its milk supply and if a high quality can be guaranteed, will be willing to pay a better price. His experience at Wauwinet farm bears out this belief.—*New England Farmer.*

Feeding Skim Milk to Cows.

Upon the experiment station side, there is very little data in regard to feeding skim milk to cows. There are many dairymen who make a practice of giving all their spare skim milk, and buttermilk as well, to the cows, and claim good results therefrom. In one hundred pounds of skim milk there are about three and one-fourth pounds of casein, one-half pound of albumen, four and three-fourths pounds of sugar, three-fourths pounds of ash

YOUR WAGON WHEELS

may need new rings, new spokes or new tires. These repairs have to be made every little while with wooden wheels. Stop all this expense for all time by buying a set of our

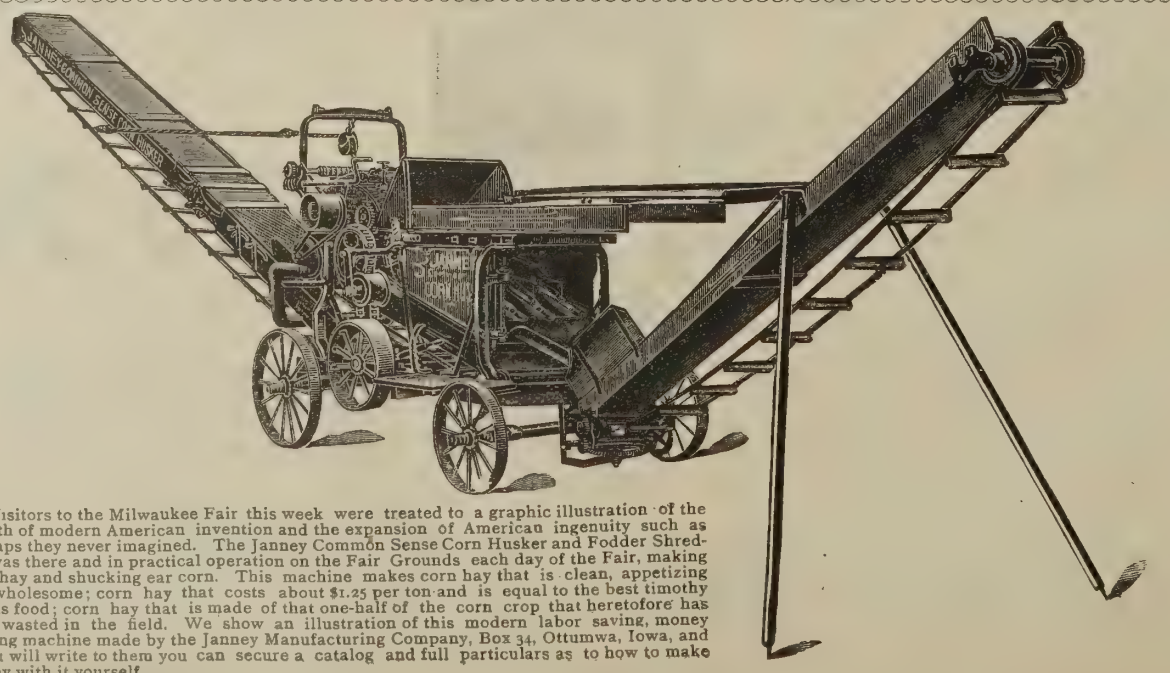
HARTMAN'S STEEL PICKET FENCE

A Rare Combination OF BEAUTY AND UTILITY.



Combines in a high degree the qualities of a first-class fence, and beautifies the lawn and surroundings, thereby enhancing the value of the property. Takes up little space, harbors no weeds and is strong and durable. It greatly adds to the attractiveness of Public Grounds, Parks, School Lawns, Church Enclosures, Cemetery Lots, etc. Cheaper than a good wood Picket Fence—Lasts indefinitely. Looks best and is best with our ornamental steel posts. Catalogue, circulars, etc., FREE. Address HARTMAN MFG. CO. Box 14, Ellwood City, Pa. or R 65, 309 Broadway N.Y. City.

YOU CAN PREVENT BLACKLEG

among your cattle by the use of Parke, Davis & Co.'s **BLACKLEG VACCINE.** Every lot is tested on cattle and found reliable before a single dose is put on the market. It will prevent **BLACKLEG** if fresh product is used, the same as vaccination prevents Smallpox in the human family. Operation simple, and easy to perform. Specify P. D. & Co.'s, and get the kind that is always reliable. For sale by all druggists. Write us for literature and full information, free on request.

PARKE, DAVIS & COMPANY, Detroit, Michigan.

BRANCHES: New York City, Kansas City, Mo., Baltimore, Md., New Orleans, La., Walkerville, Ont., and Montreal, Que.

Visitors to the Milwaukee Fair this week were treated to a graphic illustration of the growth of modern American invention and the expansion of American ingenuity such as perhaps they never imagined. The Janney Common Sense Corn Husker and Fodder Shredder was there and in practical operation on the Fair Grounds each day of the Fair, making corn hay and shucking ear corn. This machine makes corn hay that is clean, appetizing and wholesome; corn hay that costs about $1.25 per ton and is equal to the best timothy hay as food; corn hay that is made of that one-half of the corn crop that heretofore has been wasted in the field. We show an illustration of this modern labor saving, money making machine made by the Janney Manufacturing Company, Box 34, Ottumwa, Iowa, and if you will write to them you can secure a catalog and full particulars as to how to make money with it yourself.

and a quantity of fat varying from one-tenth to one-fourth of a pound. This amount of average skim milk contains about 9¼ pounds of digestible food nutrients, of which about four pounds are protein and the remainder carbohydrates and fat.

The nutritive ratio is 1 to 2, or about the same as that of gluten meal, buckwheat, middlings, or malt sprouts. The above quantity of skim milk contains nearly the same amount of digestible nutrients as ten pounds of gluten meal or thirteen pounds of buckwheat middlings or fifteen pounds of malt sprouts. Since skim milk is so highly nitrogenous, it can well be fed to narrow the nutritive ratio of a ration in the same way as either of the above feeds.

Just how much can be fed advantageously depends largely upon the animal, since some will digest it rapidly, while others will not. Some dairymen find that it does not agree with some of their cows, when fed sweet, but if fed after it has become a little sour, they have no difficulty. For this reason, they mix it with their buttermilk, and feed the two together. The same thing is found true in the human family—some people cannot digest sweet milk easily, while with buttermilk, where the development of acid has progressed for a time, they have no trouble whatever. I would not advise feeding, at first, more than fifty pounds per head daily, which would be an ordinary pailful, twice a day. From the figures given above, it will be seen that this quantity contains about five pounds of dry food substance, and is equivalent in food nutrients to five pounds of gluten meal, six and one-half pounds of buckwheat middlings, or seven and one-half pounds of malt sprouts. I have named these feeds because they have about the same nutritive ratio as skim milk. Comparison could be made with the other food nutrients in other grains, but as the nutritive ratio is different, the comparison might be misleading. Bearing in mind the amount of actual food in skim milk, the feeder can then make up the remainder of his ration from any feeds at his command. I would suggest, however, that wheat bran always be fed in order to counteract any possible constipating effect of the milk. And if this effect is found troublesome, it would be well to feed a little oil meal, say one-half pound or so daily. Let the cows drink the milk as they would water, and feed the grain dry.—*Rural New Yorker.*

IN HOT WEATHER.

How to Take Care of the Chicks That are Hatched In July and August.

Years ago I decided it did not pay to have chicks hatched in July and August, and I still think it does not, unless you have good shady runs for them. By placing their coops under the wide spreading branches of a large apple tree, and after they are a week old giving them the run of the orchard as soon as the dew is gone, I find they thrive well. For two weeks I feed them five times a day, giving fresh water each time. After that time they are fed three times and are furnished larger water vessels, care being taken to keep them always in the shade. Shade and fresh water are two things fowls or chicks must have in hot weather if they thrive. I have a fine lot of sturdy fellows now, and thriftier chicks I never saw. We are cultivating part of the orchard, and it makes an ideal place for July chicks.

For early hatches we placed the brooders on a dry, grassy knoll east of the house, where they get the benefit of the first rays of Old Sol, and indeed on to his last. We surrounded each brooder with a low net wire fence and had no trouble with them wandering away from their home. We taught them a call by repeating it every time we fed them, and now since the fence is removed they come from far and from near at the rap, tap, tap, upon the tin vessel I always carry with me.

Even in early spring the sun occasionally shines so hot that the chicks need shade other than provided by the brooders. We made low sheds, and they enjoyed being under them when the sun shone hot and on top when they wanted a sunning.

I intend having chicks hatch each month and raising them with the mother hen. Let me remind others who will do the same to select a cool, shady place for biddie to spend her three weeks of exile in. I find nothing better than the A coop in some secluded nook where the sun can never find her, unless she has found such a place for herself, where she has had no help in filling her nest.

If so, I think it better to remove the eggs as laid and keep them in a cool place, turning them over every day until she decides she has labored long enough, when I reward her with a clean, fresh nest and fifteen of the finest eggs obtainable. I set her in faith and am not disappointed.

Let me again remind you to look well to the comfort of the yarded fowls. See that they have plenty of pure, fresh water in clean vessels. Dig up the soil deep and mellow in the shade, where they can cool their heated bodies by rolling and wallowing. Place nests in out of the way corners, where biddie will imagine she is hidden. If half the yard is in grass, give them the waste from the garden—mustard, lettuce, radishes, onion tops and an occasional basket of weeds—and see how they will enjoy the change.—Mrs. A. B. B., in *Reliable Poultry Journal.*

CONCERNING OUR ADVERTISERS.

On another page of this issue will be found the advertisements of the Wilmington Wheel Co., of Wilmington, Del. As will be observed from the ad, these people are manufacturers of all kinds of buggy, carriage and light and heavy wagon wheels. They sell these wheels direct to the user at a very low cash price and give a positive guarantee of quality. They have long been known to the public as manufacturers of honest goods and are famous for fair dealing. Write them for circulars, prices, etc.

J. F. EGERTON, of Footville, Wis., starts an ad. this week in the DAIRYMAN of his excellent herd of Jerseys, and in a letter he has the following to say concerning them:

"The herd consists of about forty head of registered Jerseys, is headed by Toltec's Signal 29501, a descendant of the best Tennessee blood, and Signal's Recorder 45885, a product of the very best Combination and Tennessee blood.

The females are all from the best blood, including Tormenter, Signal, Combination, Omaha and Pedro.

Among the aged cows are Baby Ryan, 17 lbs., 8 ozs.; Carrie Gold, 16 lbs., 8 ozs.; Big Bargain, 16 lbs., 4 ozs.; Toltia, 15 lbs., 8 ozs.; Cymbelina, 14 lbs., 13 ozs., and many others capable of making good tests.

No cows are used for breeding that will not make 14 pounds per week and none but good ones are for sale."

VETERINARY.

Queries in this department answered by WM. HORNE, M. D. V. S., Janesville, Wis.

COW PHYSIC—Three-fourths to 1¼ pounds Epsom Salts (according to age and size of animals) and two ounces of best ground ginger. Pour over this three pints of boiling water. When at 105° F., give gradually as one dose.

NYMPHOMANIA.

I have a very good registered Jersey cow; I can't get her in calf. She takes the bull every three weeks and she has kept on that for nearly a year. P. H.

Duluth, Minn.

ANSWER.

Yes, stop all service and get the best advertised emmenogogue medicine. Read ads. in DAIRYMAN. These medicines are the best and cheapest, better than any form I can recommend in prescription, as they are delicate and difficult in safe compounding.

GARGET.

I have a very fine Jersey cow whose calf is two months old. When she first came in she was in a very delicate condition, would not eat without I gave her a dose of medicine first. The left side of her udder stayed swollen and gave very little milk, and that she did give, was lumpy and thick (almost green). The right side of her udder stayed all right for sometime, but for about two weeks it is worse than the other.

East Atlantic, Ga. C. O. S.

ANSWER.

Immediate full dose of physic such as you think she can stand, not more. After this, give sixty grains of iodide of potassa each morning for twenty to thirty days in a little cold water, a small drench. Rub the hard parts, only, of the udder with strong camphorated spirits, six parts, and common turpentine, two parts, only. Rub hard twice the first day, then once a day for two days, then every third day. I don't believe such a cow, as you describe, is fit to propogate from, nor do I think she is in any way, a cow to keep for any purpose. She is a scrofulous subject of the worst type and to me worthless.

SYMPTOMS OF TUBERCULOSIS.

What are the symptoms by which a common farmer can know tuberculosis? Will a cow that is affected with tuberculosis continue to give a large mess of rich milk? Is tuberculosis very contagious? J. B. J.

Elwood, Neb.

ANSWER.

Staring coat, cough, small tumors upon the extremities, swelled points, lameness in one or more legs, or all of them, a sunken countenance, watery, weak looking eyes. Of course no poor cow has all of these, but these are all symptoms variously developed. Tuberculosis is dangerously contagious always, and in various ways. Some do milk well, much too well, for the community using milk.

OPHTHALMIA.

I have several of my yearlings and two-year-old heifers, also my registered Jersey bull troubled with a disease affecting the eyeball. It first came with a watery substance running from the eye, then the eyeball covered over with a yellowish, white, opaque covering, looking like matter inside, causing blindness. The most of them only affected in one eye, but the bull and one yearling are blind in both eyes. On the advice of our local physician, I used calomel and sugar pounded together in mortar, in equal quantities by measure, and blew it into the eye each day. W. W. C.

Fredericksburg, Texas.

ANSWER.

You have clearly, specific ophthalmia. This in your case is infectious to all intents and purposes. Separate all the affected at once, and keep them so for a while. The calomel and sugar was a bad application indeed. Water extract of opium four ounces, tincture of arsenic four ounces, water two ounces. Squeeze some of this into the eye; pull up the upper lid and squeeze into the lower lid. Physic all of the patients; four ounces for one-year-old, six ounces for two-year-old. Repeat if needed. This is as per head of this column, and of much importance for good. To be repeated if needed in five days. Keep in shady place constantly.

DROPSY—DIFFICULTY IN PASSING WATER.

I have a Jersey cow which had a small swelling in the rear part of udder; commenced about four weeks ago, and the swelling increased very rapidly until the third or fourth day when her udder was four times its natural size. And as she had a large udder naturally it seemed it would burst. I sent for the local veterinary; he came and examined her and left some medicine. I followed his instructions but the cow kept growing worse. After about six days the swelling left one side of the udder and pushed forward onto her body in front and on the left side of the udder and body. In about ten days her body was nearly twice its natural size. The swelling being on the left side and underneath the body extending to the fore leg and shoulder and up the side nearly to the back bone. After about two weeks she laid down and could not get up, and I thought she would surely die, so I opened her with my jack knife, making a gash about one and a half inches long just in front of the udder. Nearly a wash tub full of bloody water run out and in two hours there was no swelling and the cow got up and went to eating grass, and has been getting better ever since, except her skin is rough and scaly and she seems stiff in her hind parts and is very thin and weak. The water kept dripping from the wound for ten days.

I have a two-year-old heifer giving milk. She has trouble passing water at different times all summer. She can only pass stream size of a straw. What can I do for her? Her hair looks rough and she is quite thin, otherwise seems to be all right. J. E. A.

Stillwater, Minn.

ANSWER.

You are to blame, or more properly, the veterinary surgeon. Had you thoroughly purged the cow, she would have escaped the dropsy, no doubt. It may swell up again, if so, thoroughly physic and repeat as may be needed.

No. 2. The heifer has some sort of obstruction in channel somewhere; an exploration can alone tell where and how. Get a truly posted veterinary surgeon.

Horse Owners! Use GOMBAULT'S Caustic Balsam

FACTS REGARDING "OLEO."

Ninety-nine Per Cent of Users Think They Have Butter.

The *Philadelphia Times* has the following: Philadelphians eat 40,000 pounds of oleomargarine weekly.

That amount feeds 80,000 persons, and ninety nine of every one hundred think they are eating butter.

The weekly profits from the retail sales of oleo are $4,000.

There are 150 merchants in this city who pay the special government tax of $48 to sell the beef-fat substitute for butter. The average profits to each are over $26 weekly.

These facts were used by lawyer Luther S. Kaufmann, representing the Pure Butter Protective Association, in his appeal to the Retail Grocers' Association to aid in the prosecution of violators of the oleo law. Incidentally Mr. Kaufmann said that one merchant who was arrested last week, admitted that he had a regular weekly sale of 2,700 pounds which meant $270 profit. The progress of the work of prosecution, by which it is believed that the number of oleo merchants has been greatly diminished, and the output cut down from 100,000 to 40,000 pounds, was briefly told by Mr. Kaufmann.

The Pure Butter Protective Association will continue the war against those merchants who are retailing oleo in unstamped wrappers as butter, and at a price a few cents lower than the price of good butter.

The agents of the association, who have been working throughout the city, have made 250 purchases of oleo from various dealers. Of these only three or four packages bore the stamp as required by the state law. All dealers who sold the unmarked packages, Mr. Kaufmann said, would be prosecuted. In every case where it can be accomplished, the merchants will be charged with a violation of the federal law, owing to the greater severity of the punishment which may be imposed when a conviction is secured. The penalty is a fine not exceeding $1,000 and imprisonment not exceeding two years. The penalty under the state law is fixed at $100 fine in the first offense and $150 fine or sixty days' imprisonment in the second offense.

The Value of Grit as a Food Adjunct.

What part does grit play in the digestive organs of the fowl? Open a few fowls while food is being digested, and see for yourself. There is the gizzard, with its tough inner lining and its outworks of strong, tough, and thick muscle; this muscle is so disposed that there can be no mistaking its purpose. The gizzard is a mill, a grinding machine—and what does it grind with? The walls are roughened, to be sure, but these corrugations of tough membrane are not sufficient in themselves to cut and grind whole grain even if it has been somewhat softened by the digestive fluids. The grain will not cut grain, and surely will not render green stuffs fine enough to become soluble in the digestive fluids of the intestines, beyond the gizzard. The grinding must be done by good, hard, sharp stone—grit—and nature has taught the fowl to supply itself with millstones for this powerful little mill to grind its grist with. When this mill first was invented, and pressed into service, it is not probable that the owners thereof had many messes of soft food.

The soft foods we now give our poultry are for the most part made of finely ground stuffs, and are partially digested by cooking, and the fluid used in mixing. The gizzard can hardly bring any amount of grinding to bear on such foods; but more probably devotes itself to mixing it with the other foods, and passing it along to the several feet of digestive apparatus through which the food must pass through before the waste is voided.

That grit is absolutely essential to the proper digestion of hard grains is easily proved. Shut a fowl up where she cannot possibly get any grit, feed her on nothing but hard grain, and in a short period (depending on how well she was supplied when imprisoned, and on the vigor of the bird) you will find that she will show a distaste for her food, and later on she will develop a pronounced case of indigestion. A fowl so penned, and fed on soft food, will hold out longer, and may not show any ill effects until she succumbs to overfatness. Or, when your fowls are cooped for winter, and the pens are fairly free of gravel or any kind of grit, feed them almost wholly on hard grain, and supply them no grit—then when you note a letup in the appetites, go out and fill up the grit and hell box. Until you have tried it, you cannot appreciate grit, or how a fowl is capable of holding of it. You will note a picking up in the appetite immediately following the filling of the grit box.

The prime importance of grit is its grinding and cutting power; but grits containing some percentage of lime and iron probably part with a portion of their constituents to the food carriers of the body, though the bulk of the worn grit proves insoluble, and is voided.

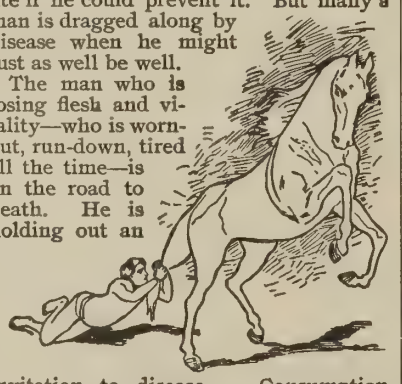
There is no period in a fowl's life when it can do well without grit of some sort. It should be mixed with the first food a chick gets, and thereafter should be always accessible. It is essential that the grit be fairly hard, but should not be so hard that it will wear smooth. The grit that does not wear smooth (as glass and marbles will), but always presents a rough, cutting surface, is the best. Oyster shell is a valuable and necessary adjunct to grit; you need both.—*Success With Poultry.*

THE JONES UMBRELLA "ROOF."

A NEW UNION TWILLED SILK "ROOF" $1.00

RE-COVER YOUR OWN UMBRELLA.

The Adjustable "Roof" fits any frame, requires no sewing, and can be put on in a minute. You can re-cover your own umbrella without the slightest trouble or moments delay.



Take the measure (to the fraction of an inch) of your old umbrella; count the number of outside ribs; state if the center rod is steel or wood; send to us with $1.00 and we will mail postpaid, a Union Twilled Silk 25 or 26 inch Adjustable "Roof" (27 or 28 inch, $1.25; 29 or 30 inch, $1.50). Umbrella "Roofs" all sizes and prices from 50 cents to $8.00 each, according to quality. If you are not absolutely satisfied in every particular, send the "roof" back, and we will refund the money *at once*, including stamps you have used for postage. Over a quarter of a million "Roofs" sold. Booklet, "Umbrella Economy" with simple instructions necessary with your order.

All first-class dealers sell Jones Umbrella "Roofs."

The Jones-Mullen Co., 396-398 Broadway, New York.

Manufacturers of the highest grades of Umbrellas to the largest stores in the world.

A man dragged by a wild horse would cut himself loose if he could. He would not have his flesh bruised and torn for a minute if he could prevent it. But many a man is dragged along by disease when he might just as well be well.

The man who is losing flesh and vitality—who is worn-out, run-down, tired all the time—is on the road to death. He is holding out an invitation to disease. Consumption comes by neglect. Heart disease is a growth from other disorders. Nervous prostration doesn't come in a day.

Take Dr. Pierce's Golden Medical Discovery at the first sign of failing health and you will seldom be very sick. The "Golden Medical Discovery" is the best blood-maker—flesh-builder—nerve-vitalizer. It frees the body from all disease germs. It invigorates the whole digestive system and strengthens heart, lungs and brain. Hundreds of thousands of grateful patients have testified to its value.

George H. Belcher, Esq., of Dorton, Pike Co., Ky., writes: "Thirteen years ago I was wounded by a ball passing through my lung. I had a bad cough almost ever since with shortness of breath; the slightest change of weather would cause the cough to be so bad I would have to sit up in bed all night. A few months ago I began using Dr. Pierce's Golden Medical Discovery, and now can eat, sleep and work, and I feel like a new man."

Dr. Pierce's Common Sense Medical Adviser sent for 21 one-cent stamps to cover mailing *only*. Cloth binding 31 stamps. Address Dr. R. V. Pierce, Buffalo, N. Y.

HUSK YOUR CORN, SHRED YOUR FODDER, SELL YOUR HAY.

A corn crop may be profitable without saving the fodder, but it will be twice as profitable if it is saved. The new method of handling corn saves the entire crop. The new way is to run all the corn through our

JANNEY COMMON SENSE Corn Husker and Fodder Shredder

There can be no dreaded "corn stalk disease" where fodder is prepared with our machine. You can make a great deal of money husking for neighbors. Costs less than a third as much as a thresher, but makes more money.

Write for Free Catalogue.

It husks out all of the corn clean, and shreds all the fodder at the same time. Makes clean, healthful food, as the patented screen in the feed elevator takes out all the **dust, dirt, smut, etc.**

Go to your nearest dealer and see one.

JANNEY MANFG. CO., Box 29, OTTUMWA, IOWA.

A Perfect Milk Wagon

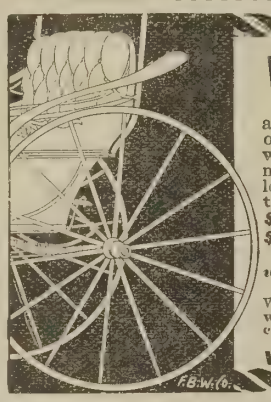
On a Perfect . . . Short Turning Gear

WE make the only drop center wagon that has a self-balancing, short turning gear. All parts are wrought iron forgings. It is so plain and simple that it can't get out of order and if any part should break, any country blacksmith can easily repair it. All other wagons of this kind have complicated gears, and mostly made of cast iron.

Write us for our Catalogue, which fully illustrates and describes this wagon and 10 other styles.

THE O. ARMLEDER CO., Cincinnati, Ohio.

MAKE ONLY SWEET ENSILAGE



Ever since the ensilage system has been introduced in this country it has been the ambition and effort of silosists to ***produce sweet ensilage.*** The making of sweet ensilage depends principally upon two things—***1st.*** the use of a well matured crop and ***2nd.*** upon low fermentation. Granting the maturity of the crop, shredded ensilage makes the sweetest ensilage. The reasons are, that shredded material is of a nature that makes it pack much more closely in the silo. That means exclusion of air; there can be no extreme fermentation and consequent development of acid without the free action of the air. ***Shredded ensilage possesses other advantages in addition to its sweetness:—*** it is eaten with great avidity by animals, being a long, soft substance and free from any sharp angles and corners to cut or lacerate the mouth and gums; it is therefore fed with less waste.

The best way to Shred Ensilage is with the

St. Albans Ensilage and Fodder Shredder.

It is the Original Shredding Machine and all other so-called shredders are merely imitations of this one. ***It will certainly pay you*** to look into the merits of this proposition and machine before buying. We mail free a pamphlet on the subject.

ST. ALBANS FOUNDRY CO., ST. ALBANS, VT

Wheels to Order...

We make all kinds of Buggy, Carriage, Light and Heavy Wagon Wheels to order—from your own measurements. **We guarantee every wheel we make** as to quality of material and workmanship. THE NEW BOOK Feeds and Feeding

By Prof. W. A. HENRY,

Wisconsin Experiment Station.

This book should be in the hands of every stock feeder in the country. Every reader of HOARD'S DAIRYMAN ought to have it. It is a large, well bound book, nicely printed, over six hundred and fifty pages. Price $2.00

Four Yearly Subscribers at $1.00 Each ($4) Will Secure It as a Premium.

Four Yearly Subscribers at $1.00 Each ($4) Will Secure It as a Premium.

Of This Book Hon. JAMES WILSON, Secretary of Agriculture, Washington, writes as follows:

"Prof. W. A. Henry, Dean of the Agricultural Department of the University of Wisconsin, has recently given to the American student and the American farmer a work on feeds and feeding. Singularly enough, up to this time we have had nothing along this line sufficiently comprehensive from both the scientific and practical standpoints. We have had very able works from both, but Prof. Henry is the first to combine science with practice, and give us a work that will be of value alike to the instructor in the Agricultural College, to the student who is seeking the principles underlying feeding, and to the practical farmer who feeds.

This publication will take its place immediately in the college library, and ultimately in the private library of every farmer in the land. When the instructor, student or practical farmer inquires where there is a work thoroughly exhaustive of this subject, he can now be referred to Prof. Henry's book.

Sent as above, or will be forwarded, carriage paid, on receipt of price, $2.00.

EVERY MONTH A PAYING MONTH.

Nine out of ten creamerymen cannot say this of their business; there are always some months in the year when their business does not pay, and it is these dull months which make the creameryman grow gray headed.

There is a way to make every month a paying month, have you ever thought what it is? What is it that makes a dull month in the creamery business? Shortage of milk, is it not? The manufacturing expense is nearly as great in making five tubs of butter as in making ten, but the profit on the latter is twice as much.

A number of creamerymen have hit upon a plan which insures a good supply of cream every day, and while some days are better than others, the results are such that every month returns a nice profit to the creameryman's pocket. The plan is this: Place Farm Separators with patrons too far distant to make the hauling of milk practicable and with others who will not send their milk to the factory because they havn't a large amount, but who would send their cream if some one would call for it.

This is no theory, as the plan is proving a success wherever tried and every creameryman who will test it can increase his profits from three to five dollars a day under the most ordinary conditions. Three dollars a day means over a thousand dollars difference in a year's business and there are not many who would knowingly let a thousand dollars slip through their fingers.

We will explain the plan more fully to any creameryman who will write us. We know it will pay you to investigate. It requires no additional capital; we will look after that, and all you need furnish is the necessary "push" in placing machines.

This is no "friendship" affair, it's just a question of whether you want to make money or not. We leave it with you to answer.

The Sharples Company,

Canal & Washington Sts., = CHICAGO, ILL.

WE WANT TO MAKE YOU PRICES ON

Cream Separators, Combined Churns and Engines,
Cream Vats, Butter Workers, Tanks,
Milk Testers, Boilers, Tread Powers,
Feed Cookers, Etc., Etc., Etc.

The Quality of Cream.

This is a matter which bears a much more important and direct relation to creamery results than is generally supposed. Other conditions being equal, that cream which is smoothest, freest from bitter froth, where the fat globules have not been broken by coming in forcible contact with inside bowl complications, etc., will produce the most butter of infinitely superior flavor. This smoothness is essentially a requirement of commercial cream. A little testimony in point follows:

OSWEGO FALLS, N. Y., April 25, 1899.

P. M. Sharples, West Chester, Pa.

Dear Sir: It is now one year since we put in the No. 25 Tubular Separator. It has not cost one cent for repairs and runs just the same as when first put in. It does fine work and gives the best of satisfaction. The ease with which we can change from light to heavy cream makes it of especial value to us, for we ship three grades of cream, and must therefore make both light and heavy cream most every day. When we need more separators we will buy only Tubulars. Thanking you for your courtesy in the past,

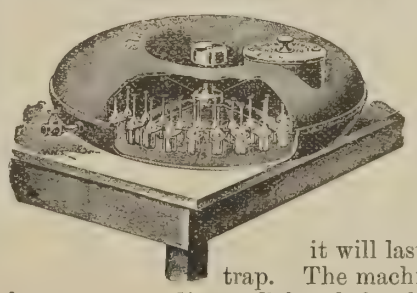
Respectfully,
E. M. RICHMOND, Manager.
JOHN HART, Proprietor. Fulton Dairy Co.

John Hart is one of the Greater New York's best known milk handlers He handles large quantities of commercial cream which must be smooth and uniform to suit his trade.

The Sharples Tubular

fully answers this requirement as it will yours, without regard to whether you use it for the above purpose, in the creamery or for clarifying and purifying milk for custom sale, condensing, etc., etc.

The cleanest of rapid skimmers. The simplest in construction. The most durable and economical. The product is unexcelled. Sold on their merits. One on trial if you want it.



Send for Catalogue No. 46.

Vibration Means Waste.

If your rattle-trap Babcock tester is not doing accurate work, then try the

STANDARD Babcock Tester

it will last for years and it is not a rattle-trap. The machine is fitted with solid cast iron frame, uses ordinary Babcock bottles and is **supplied with the famous Glass Eye Speed Indicator.** Farrington and Woll's new book on Milk Testing with each machine.

We are prepared to repair all separators, and have the most experienced men for this work.

Send for Catalog No. 61 **Elgin Manufacturing Co. Elgin, Ill.**

At This Season of the Year

The preservation of milk demands that it be cooled in some manner. With the

Champion Milk Cooler

it may be **Cooled and Aerated in one Process.** The Aeration removes all unpleasant oders from the milk. The cooling reduces the temperature quickly so that the keeping quality of the milk will be much improved.

The **Champion Cooler** can be used with ice, cold well water or running water. There is no other cooler so convenient and so effectual.

No Dairyman can afford to be without one of these coolers. The price brings them within the reach of all. Write for booklet, "Milk and its Care," which tells all about them.

The National Export Exposition
AT PHILADELPHIA, PA.

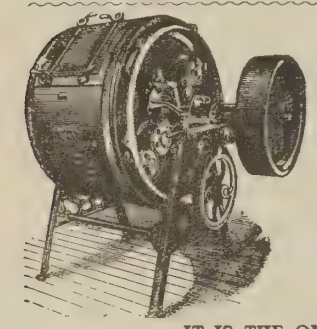
For the advancement of American Manufacture and the extension of Export Trade; opens September 14th and closes November 30th, 1899.

This will be the most elaborate and extensive exposition of its kind ever held in our country. The exporting of Dairy Products is one of the largest items of American Commerce, and we intend to be "Right in Line."

We will exhibit a Model Milk Distributing Plant, exhibiting in actual operation our Mechanical Refrigerating Plant, Potts Pasteurizer, De Laval Separator, Bottle Filler, Ideal Steam Turbine, and new Acme Belt Bottle Washer, Sterilizing Oven, Disbrow Churn, etc., etc. In fact, exhibit the most complete collection of Modern, Up-to-date Apparatus for handling Pasteurized Milk for retail trade.

It would pay you to take advantage of the cheap Railroad Excursions, and visit this exhibit and become acquainted with the modern process of handling milk.

We should be glad to have you write us at Philadelphia, care of the National Export Exposition. We will have representatives there to give you any information in regard to any apparatus necessary for such a plant.



Alpha De Laval Separators, Ideal Turbine Testers, Disbrow Churns, Elgin Style White Ash Tubs, Ideal Corrosive Sublimate Tablets, Parchment Paper, Australian Boxes, Refrigerating Machinery, Boilers and Engines, American and Lusted Printers, Genesee Salt, Potts Pasteurizer, Etc., Etc.

Reading notices, 50 cents per line (nonpariel measure) each insertion.

A BILL is before the English Parliament, with good prospect of its becoming a law, which effectually prohibits the coloring oleomargarine in the yellow color of butter, or mixing it, in any quantity whatever, with butter that is offered for sale. Gradually the eyes of the civilized world are becoming opened to a true conception of what an unmitigated fraud oleomargarine is, and how much fraud and deceit its makers and sellers use in forcing it on to the consumer.

HOW THE FRAUD WORKS.

In a private letter written us by Mr. C. M. Sanders, of Penfield, Georgia, he gives some idea how the oleomargarine fraud makes its way in the cities of the south. He states that he has recently made a canvass of the city of Augusta, and he finds that more than one-half of the stuff *sold as butter* is oleomargarine. At Savannah he was told that seventy-five per cent of the sales was oleomargarine. This consumption of the stuff, let it be understood, is brought about by fraud and deceit, deceiving the final consumer with the pretense that he is getting butter. The same is true all over the world. The sale and consumption of oleomargarine is based every where on deception. And we have newspapers, lawyers, doctors, chemists and courts, in some instances, lending themselves to the perpetuation of this fraud.

Pigs Weak in Back.

ED. HOARD'S DAIRYMAN:—Please give me the reason for my young hogs getting weak behind. They will sit down quite often when eating, as well as other times, and then it will wear off for a spell, and in a few days be the same. They are always in a clean, dry place. W. S. P.

Cambridge.

ANSWERED BY THEODORE LEWIS.

Your pigs are affected with paralysis. Had you stated the age and weight of pigs, and what you are feeding and how much, a more definite answer could be made. In your case, cold and damp sleeping places has not added to the cause, but undoubtedly want of exercise, with high feeding of some one kind of food, causing indigestion. Constipation as a rule is the forerunner, followed eventually by diarrhœa.

I find as a rule, here in the west, in dairy districts, that when milk is plenty, the excessive feeding of milk is a cause. This is especially true where buttermilk can be obtained at nominal prices, and is fed to excess without addition of grain, and often without pasture and exercise, causing, of course, in time, indgestion, and the result is paralysis. Dr. D. McIntosh, in his work on diseases of swine, recommends the following, which has been used with good results to the writer's knowledge:

In the early stages of the disease, give the pig one ounce of castor oil, (of course use judgment, as to the size and age of your pigs) and one or two drops of croton oil in it. As soon as the physic operates, give eight or ten grains of iodide of potassium, three times a day in drinking water.

If the animal will not take it in the drinking water, put it in a little water and give it with a spoon. In three days if the animal is not improved, give it from two to three drops of the fluid extract of nux vomica, and from ten to fifteen drops of oil of gaultheria (wintergreen) in a tablespoonful of sweet oil three times a day.

Rub the back and loins with an irritating liniment, daily. The writer has used turpentine, pure and simple, with good effect. Of course, if the pigs recover, begin feeding gradually on an easily digested ration.

GENERAL-PURPOSE COWS.

Property of A. J. JUDD, Warren, Ohio. (See letter on page 638)

A Word of Encouragement to the Hoard's Dairyman.—Something about Washington.

ED. HOARD'S DAIRYMAN:—I have been intending to write you for sometime, but owing to illness have neglected to do so.

I am much pleased to get and distribute your subscription cards for the DAIRYMAN. It helps my neighbors, by spreading a ray of dairy knowledge throughout the country. As a result, I expect to see better dairy stock, better dairy farms and better profit.

Your fight against the oleomargarine combine and milk adulterators and frauds of all kinds is a noble one. You should have the earnest support of every farmer and consumer of milk and butter in the land. Let every state legislature and the National Congress pass laws which will cramp these frauds into a close corner. That done, the manufacturer or seller of such swindles will speedily find themselves in prison. Then these public frauds and destroyers of the health of innocent children can be suppressed.

I think the state of Washington an ideal dairy country. We have plenty of cold water, the year round, and an abundance of green grass, nine months in the year; still there are thousands of pounds of butter and cheese shipped in here from California and the east every year.

This place would be a good point to start a creamery, for the milk of three to five hundred cows can be obtained. All it needs is some one with a knowledge of the business and a little capital. The market is good and growing better. If you know of such a man, refer him to me. Long live the DAIRYMAN. CHAS. ZIMMERLE.

Everett, Wash.

What a Creamery Does.

There are four creameries contiguous to Ackley, Ia., and the *World* of that place says of the benefit to a community of a creamery:

The operation of a well conducted creamery, in a community where it was before unknown, works a revolution in all directions on the farm. It lightens the labors of the wife and daughter; it secures a month's certain cash income; it restores impoverished acres; it means more and better pigs, more and better calves; a more equal distribution of farm work all the year round. It will do more for a community than a new railroad, and will, without fail, lift a chattel mortgage and down-at-the-heel grain raiser into a plane of independence and comfort, while it, and what naturally grows out of such a system of agriculture, will vitalize his depleted soil, and in a few years double its productive capacity. This is neither theorizing, nor fanciful speculation, but a plain statement of cause and effect. It has been done and is being done all over the west.

Dairy Work in the Maritime Provinces.

ED. HOARD'S DAIRYMAN:—It was the writer's privilege to visit a number of factories in the last few days and surprise became monotonous to find the large amount of milk taken daily at these factories. Nearly all the factories that I visited were taxed to their full capacity. In fact many of them could not receive Monday morning's milk at all, not having conveniences to handle so large an amount as would be delivered on Monday morning, so that as a general thing Monday morning's milk, or rather Saturday night's and Sunday morning's milk, was kept at home.

In many cases plans are matured to enlarge the factories, and what is very funny, factories when being built caused a great deal of adverse comment on account of their large size. There are fully twenty-five per cent more patrons sending their milk to the factories in these provinces this year than ever before, and what is more, the heresy of selling the farm by the bushel, as has been, is quickly being dissipated, and will soon be a thing of the past. In fact, a man now known to be farming that way—growing grain for sale—is looked upon with contempt, as an enemy to civilization, a menace to his community, a soil robber and a harsh parent to his family and to his posterity.

Farmers never had more reason than now to feel jubilant. The crops—every one of the staples—promise to be the best for ten years. The hay crop was an immense one and has been made in good condition. Agricultural products of all kinds were not so high for years. Beef cattle and sheep are in brisk demand. Hogs of the right quality are worth $5.50. Cheese has reached the ten-cent notch and butter is worth twenty cents. There is an immense root crop—turnips and mangels—and a very la ge area.

This with the big hay crop, the large amount of oat straw and the splendid crops of wheat, barley and oats will enable farmers to feed their animals much better than they ever did, and send them to market in top condition. It will enable them to carry on winter dairying next winter on a much more gigantic scale than ever before. Manifestly this is a period of prosperity for the farmer, and the prosperity of the farmer will reflect on many other classes of industry. The last year of the century will certainly be a phenomenal one for the agricultural class.

At the last board meeting at Charlottetown, Prince Edward Island, nine and fifteen-sixteenths was realized for some cheese. Several sales at ten cents had been made by private sale. I have been told by some factory managers that the board here received offers of eleven cents for September cheese. It is eight years since such prices for cheese prevailed in the Maritime provinces, as are now being obtained. I hear there is talk of several new factories going up in different parts next year. J. A. M.

THE shipments of oleomargarine from San Francisco to Honolulu have been over 70,000 pounds a month some of the time the present summer.

Coming Events.

Georgia Dairymen's Association, Grantville, Ga., Oct. 12, 13, 1899.

Pennsylvania Dairy Union, December 5-6, 1899, West Chester, Pa.

From Vancouver Island.

A Scotsman's Letter—The Climate and Products Described—Ration Formula Wanted—Feeds are Expensive, but Butter Brings a Good Price.

ED. HOARD'S DAIRYMAN:—I have here a herd of some fifteen grade Jerseys, and I would like you to send me a ration. We have a mild winter here with a lot of wet, but seldom cold weather. Green grass grows on the open hill ranges all winter, and the cows are out grazing every day, except when it is very wet or snow on the ground. Now, I have orchard grass hay, with some clover and rye grass, plenty of oat straw, and a green bite on the hill pasture all winter. We buy the following feeds in town: Middlings per ton, $25 to $27; bran per ton, $20 to $25; ground feed, $25 to $30. Kindly advise me how to mix a ration for each cow. I have a warm, comfortable and convenient barn, with hay and other feed all under one roof. We churn once a week, and we get thirty cents per pound for our butter all the year round. I have a separator and feed skim milk to calves and pigs. We have a registered Jersey bull in the district.

They say dairying doesn't pay here, but I read HOARD'S DAIRYMAN and I'm trying my level best, as a Scotsman will, patiently and persistently, to make my cows pay. We can't farm without a barn full of cows, and I hope to make the cows board me and my family, besides keeping up the fertility of my farm. I don't bother you often, and I shall be glad to hear from you. I have distributed a lot of your cards among my neighbors. By and by I will let you know how dairying pays on Vancouver Island. J. D. Reid.

Victoria, B. C.

Letters like the foregoing give us renewed faith and courage. It is worth a good deal of patient care and study to win such generous commendation from such a source, and we tender sincerest thanks to Mr. Reid for his congratulations and complimentary words. And there are others—so many that we cannot mention them—to whom we are similarly indebted, and we take this opportunity to assure them individually and collectively that their kind and generous words are highly prized.

Mr. Reid is certainly very fortunate in many respects, and we see no reason why he should not be able to make his cows return him a substantial profit every year, provided he takes proper care, as we are confident he will, to weed out the poorer cows from year to year. To this end, he ought to keep a daily record of the milk yielded by each cow and test the same at least twice a month. Such a record will assuredly change his opinion more or less as to which are the better cows. Many a good cow, good in a long run, has been sacrificed because she could not keep abreast of some other cow for a week or a month, although able to show a decided lead in ten months. Commence the record at once and keep it up.

In the matter of a ration, we incline to the opinion that some general suggestions will be more valuable than a specific formula. The climatic conditions reported will be quite certain to produce grass and hay, not at all in accord with the general average of our feeding tables. It is much to be regretted that some of the by-products containing more protein are not available—such for instance as gluten meal. In the absence of these, we would mix the bran and middlings in about equal amounts by weight and feed an average of, say, one pound for each 100 lbs. of live weight. The record above suggested will serve as a guide to point out the cows that should have more than this average, and also those who cannot profitable utilize so much. In other words, feed for results and be governed by results. Cows have their limits of profitable production, depending partly upon inherent quality and partly upon the stage of lactation. It is not a question of the feed required for maintenance, but of the capacity of the cow under existing conditions to eat more than this and make milk of it. The more she will eat and thus use, the greater profit will she yield. One cow may have double the capacity in this respect of some other cow, and it would not be good sense to feed each the same amount.

In addition to the allowance of grain, give simply all the hay each cow will eat with relish, and not more. Remember also that a little salt every day helps in the digestion and assimilation of the feed and particularly of the protein, which is the indispensable element in milk making.

That report about dairying on Vancouver Island will be most welcome.

THE DAIRY EXHIBIT AT WISCONSIN STATE FAIR.

The Dairy show at the Wisconsin State Fair was of excellent quality this year. Many noted breeders of dairy cattle showed fine specimens from their individual herds, and judging from the crowds that surrounded them, even the city people are beginning to take more than a passing interest in the dairy cow and do not attend the fair solely for the horse racing and side show attractions.

The Jersey, Guernsey and Holstein breeds were well represented, with some Ayrshires and Brown Swiss. As is natural, Wisconsin animals made up the larger part of the exhibit, but several noted herds from outside of the state were present, notably the Hood Farm Herd and the exhibit of H. M. Higinbotham, of Chicago, and J. E. Robbins, of Greensburg, Ind., among the Jerseys. The Holsteins showed herds from Iowa, Illinois and Nebraska, as well as Wisconsin.

The awards were as follows:

CLASS 16. Red Polled—Andrew Bros., Cedarville, O., first on bull 3 years or over, bull 1 year and under 2, bull calf, cow 3 years or over, heifer 2 years and under 3, heifer 1 year and under 2, heifer calf, four animals either sex, two animals either sex under 4; second on bull calf, cow 3 years or over, heifer 2 years and under 3, heifer 1 year and under 2, heifer calf, first on champion bull under 2 years, first on champion cow, first on junior bull.

CLASS 19. Holstein—W. B. Barney, Hampton, Ia., first on bull 2 years or over, second on bull calf, first and third on cow 3 years or over, first on heifer 2 years and under 3, third on heifer 1 year and under 2, first and second on heifer calf, first on four animals of either sex, second and third on two animals of either sex, first on champion bull and champion cow 2 years and over. Rusk Bros., North Greenfield, Wis., second on bull 2 years or over, second and third on bull 1 year and under 2, third on bull calf, second on heifer 2 years and under 3, first on heifer 1 year and under 2, second on four animals of either sex, first on two animals of either sex, and first on junior champion heifer under 2 years. T. Two & Sons, Winnebago, Ill., third on bull 3 years and over, first on junior champion bull under 2 years, first on bull 1 year and under 2. McCall, Collegeville, Neb., first on bull 2 years and under 3, second on cow 3 years and over, third on heifer 2 years and under 3, second on heifer 1 year and under 2, third on heifer calf, third on four animals of either sex. J. N. Chappel, Kearney, Neb., first on bull calf.

CLASS 23. Ayrshire—Edward Finn, Fort Atkinson, Wis., awarded all premiums on bull 2 years or over, bull 2 years and under 3, bull 1 year and under 2, bull calf, cow 3 years or over, heifer 2 years and under 3, heifer 1 year and under 2, heifer calf.

CLASS 21. Jersey—Hood Farm, Lowell, Mass., first on bull 3 years old or over, bull 1 year and under 2, cow 3 years old or over, champion cow 2 years or over, junior champion cow; second on bull 2 years old and under 3, bull calf, heifer 1 year and under 2, heifer calf; third on bull 1 year and under 2, cow 3 years or over, heifer 2 years and under 3, heifer 1 year and under 2, heifer calf. J. E. Robbins, Greensburg, Ind., first on bull 2 years and under 3, bull calf, heifer 1 year and under 2, heifer calf; second on bull 3 years or over, cow 3 years or over, heifer 2 years and under 3, four animals of either sex under 4 years, the get of one sire; also first and second on two animals of either sex under 4 years, the product of one cow, champion bull 2 years or over and junior champion bull under 2 years. H. M. Higinbotham, Chicago, first on exhibition herd of four animals of either sex under 4 years, the get of one sire, on heifer 2 years and under 3, second on bull 3 years old or over, bull 1 year and under 2, third on bull calf.

CLASS 20. Guernseys—Bulls 3 years or over: F. W. Tratt, Whitewater, first; L. B. Axtell, Perry, O., second; A. J. Philips, West Salem, third. Bulls 2 years and under 3: L. B. Axtell, first; A. J. Philips, second; F. W. Tratt, third. Bulls 1 year and under 2: G. C. Hill & Son, Rosendale, first; L. B. Axtell, second and third. Bull calf: A. J. Phillips, first; F. W. Tratt, second and third. Cow 3 years and over: A. J. Phllips, first, second and third. Heifer 2 years and under 3: A. J. Phillips, first; F. W. Tratt, second and third. Heifer 2 years and under 3: A. J. Philips, first; F. W. Tratt, second and third. Heifer calf: A. J. Philips, first; F. W. Tratt, second and third. Exhibitors' herds, four animals of either sex under 4 years, the get of one sire: F. W. Tratt, first and third; A. J. Philips, second. Two animals of either sex under 4 years, produce of one cow: A. J. Philips, first; F. W. Tratt, second. Champion bull 2 years or over: F. W. Tratt. Champion cow 2 years or over, A. J. Philips. Junior champion bull under 2 years: Hill & Son. Heifer under 2 years: F. W. Tratt.

CLASS 22. Brown Swiss—E. M. Barton, Hillsdale, Ill., first on bull 3 years or over, bull 1 year, bull calf, cow 3 years or over, heifer 2 years and under 3; second on bull 2 years and under 3, cow 3 years or over, heifer 2 years and under 3, heifer 1 year and under 2, heifer calf; third on bull 1 year and under 2, bull calf. C. E. Cook & Son, Huntley, Ill., first on bull 2 years and under 3, heifer 1 year and uuder 2, heifer calf; second on bull 1 year and under 2; third on cow 3 years or over, heifer 2 years and under 3, heifer 1 year and under 2, heifer calf.

A fine exhibition of dairy products was made and the awards and scores were by the following judges:

Superintendent, J. W. Thomas, Anson; judge of the butter, S. E. Davis, Chicago; judge of the cheese, Henry Bamford, Plymouth.

Class 110, Creamery Butter — Arcadia Creamery Company, Arcadia, Wis., 96; B. Andrae, Stearns, Wis., 94; A. F. Aspinwall, Deerfield, 90½; F. W. Ashman, Sandusky, Wis., 96; Balsam Lake Creamery Company, Lykens, Wis., 94¾; D. Bleuer, Omro, 95½; W. E. Blumenstein, Sullivan, 95½; P. Bjewegaard, Barwig, Wis., 93¼; R. M. Bussard, Poynette, 95; J. F. Brady, Deerfield, Minn., 94; Cleveland Creamery Company, Cleveland, Wis., 96½; W. H. Cockerills, Cedarburg, 92¾; Ole Esker, Cook Valley, 97; Albert Erickson, Volga, 98; J. O. Enger, Merrillan, 96; C. H. Golden, Rome, 96; J. O. Gibson, Urne, Wis., 95¾; K. Gibson, Misha Mokwa, 94; H. Harmenson, Scandinavia, 96½; A. High, Berlin, 93½; W. R. Holcomb, Oak Hill, 91¾; Frank Ivey, Mineral Point, 97⅞; G. E. Gorden, Amherst, 95½; Walter Judevine, Gratiot, 97½; C. M. Kates, Custer, 96½; Koepsell, Lewiston, 98½; M. J. Lathrop, Logansville, 97¾; H. A. Landt, Cashton, 97¼; Henry Larson Company, Dodgeville, 97; E. B. Melindy, Sheboygan Falls, 96¾; F. E. McCormick, Towerville, 97; James Moore, Albion, 98½; C. H. Marsh, Janesville, 93¾; M. Michels, Garnett, 95; J. E. Noyes, Grantsburg, 91; George Nelson, New Sweden, Minn., 93; C. L. Passmore, Iola, 94½; E. A. Paddock, Tibbets, 93½; J. T. Parsis, Berlin, 91¼; Kate F. Peffer, Pewaukee, 96¼; S. S. Sorenson, Alpha, Minn., 95; George Sampson, Sharon, Wis., 95; O. P. Strum, Falan, 93; G. Strussi, Cuba City, 96; W. A. Voight, Naugart, Wis., 95½; James Van Duser, Hebron, 94¾; D. A. Sheldon, Lake Mills, 91; Stiles & Drake, Lake Mills, 91½; J. N. Wigginton, Hustler, 97; L. O. Wahler, York, 97; W. R. Wigginton, Milton, 97.

The average for *fifty-one* exhibits is over *ninety-five* points.

Dairy butter—Burwood Stock farm, Milwaukee, 92¾; Lizzie Buskirk, Oak Hill, 90½; F. Bolder, Salem, 93¼; Mrs. T. W. Curtis, Poynette, 93; W. R. Holcomb, Oak Hill, 91¾; Walter Little, Janesville, 89½; H. T. Leach, North Brookfield, Mass., 96; Owen Bros., Portage, 91; W. F. Pilgrim, West Granville, 88¼; J. L. Ross, Lake Geneva, 90½; G. G. Snyder, Pleasant Prairie, 93;¾ A. B. Steidley, Carlinville, Ill., 92½; A. P. Stafford, Fox Lake, 94½; Chas. Thorp, Burnett, 91½; D. A. Sheldon, Lake Mills, 93; Stiles & Drake, 92½; W. E. Wright, North Brookfield, Mass , 89.

Print butter—W. E. Blumenstein, Sullivan, 94½; Mrs. T. W. Curtis, Poynette, 94; W. Hermanson, Scandinavia, 97; J. E. Jorden, Amherst, 97¼; M. Michel, Garnett, 91½; E. A. Paddock, Tibbet, 95; Kate F. Peffer, Pewaukee, 97½; James Van Busen, Hebron, 97; D. A. Sheldon, Lake Mills, 95; Drake & Stiles, Lake Mills, 94; J. N. Wiginton, Hustler, 94; W. R. Wiginton, Milton, 96.

Granulated butter—Kate Peffer, Pewaukee, first; William Peffer, Pewaukee, second; Burwood Stock farm, Milwaukee, third.

CLASS III—Cheddar Factory Cheese—E. G. Hodges, Union, 90; P. H. Kasper, Nicholson, 94; John McColedy, West Lima, 95; Hugh Nesbitt, Woodstock, 95; Wm. Nesbitt, Hub City, 95; N. Simon, Neenah, 92; H. E. Thompson, Neenah, 97; C. Ulrich, Orihula, 92; John Voigt, Orihula, 98; W. Zwicky, Vandyne, 94.

Flats and Daisy Cheese—H. S. Beyer, Denmark, 90; Cleveland Creamery Co., Cleveland, Wis., 92; R. Conrad, Edwards, 95; T. D. Coswell, Sabin, 95; Owen Failey, Lawrenceville, 92; E. G. Hodges, Union, 91; O. A. Kielsmeier, Hika, Wis., 90; Hugh Nesbitt, Woodstock, 92; Wm. Nesbitt, Hub City, 96; E. C. Pingle, Chilton, 96; Albert Smith, Farmer, 91; F. C. Sarnger, Lark, 97; Neenah Cold Storage Company, Neenah 92; C. Ulrich, Orihula, 95; John Vogt, 94; Joseph Voigt, Orihula, 93; Edward Wrinsch, St. Wendell, 95; W. Zwricky, Vandyne, 95.

Young American Cheese—R. Conrad, Edwards, 93; E. G. Hodge, Union, 90; O. A. Kielsmeier, 90; Hugh Nesbitt, Woodstock 91; W. Pauwan, Chilton, 92; John Voigt, Orihula, 93; William Zwicky, Vandyne, 94.

Brick Cheese—H. Bilgrien, Iron Ridge, 94; La Crosse Cheese & Butter Company, La Crosse, 99; Fred Moses, Tell, 97; W. Strum, Coon Valley, 98; Casper Anderegg, Lisel, 95.

Swiss Cheese—H. Bilgrien, Iron Ridge, 96; E. C. Wenger, Monroe, 97.

Water for Calves.

(Press Bulletin.)

In order to determine how much water the herd of thirteen calves at the Kansas Agricultural College would drink, the water given them for a week was weighed, and put in a barrel with an attachment for letting it out as fast as needed. In the seven days, the thirteen calves drank 868 pounds of water, or an average of eight pounds a day. The weather during this time was warm for the first three days, and cooler the last four days. In addition, the calves got an average of fourteen pounds of skim milk, besides grain and hay.

The calves drank several times a day, not much at a time, but often. I noticed several

times, that they took only one or two swallows. Oftentimes they would take a few mouthfuls of grain, go and get two or three sups of water, then back to their grain again. Even after their ration of milk, they would take a few swallows of water.

This experiment shows that calves need water in addition to their milk ration; it also shows that they like it often, and not so much at a time. Always see that it is fresh and clean. J. A. CONOVER.

Kansas Experiment Station.

INQUIRIES AND ANSWERS.

Every inquiry must be signed with the name, Post-office and state of writer. Condense the questions into plain specific inquiry. Be careful to note if your questions have not been answered in replies to others. We are glad to answer all the pertinent questions that we can concerning machinery. Look over our advertising columns and write to the advertisers.

FEEDING STANDARDS FOR MILCH COWS.

Dry matter.	DIGESTIBLE NUTRIENTS Protein.	Carbohydrates.	Ether extract.
lbs.	lbs.	lbs.	lbs.
23 to 28	2.0 to 2.5	12 to 15.0	0.5 to 0.8

NUTRITIVE VALUE OF CORN SILAGE AND ALFALFA HAY.

Will you be kind enough to tell me what the nutritive value of corn ensilage is, compared with alfalfa hay, i. e., what number of pounds of ensilage would be equal to one hundred pounds of alfalfa, feeding value?

Denver, Col. F. J. B.

It is almost impossible to make an instructive comparison between these two feeds, because they differ so radically in composition. The following table shows the average content of digestible nutrients in one hundred pounds of each:

	Alfalfa Hay.	*Corn Silage.*
Protein	11.0 lbs.	1.3 lbs.
Carbohydrates	39.6 lbs.	14.0 lbs.
Ether Extract (fat)	1.2 lbs.	0.7 lbs.

Protein is the only element from which lean meat (muscle) and the casein of milk can be made. The carbohydrates and fat furnish the fuel for maintaining the temperature of the body and supplying the energy to keep the animal economy in motion. Protein can be made use of for the same purpose, and is estimated to be equal in this respect to the carbohydrates. The ether extract (fat) has a value about 2.25 times greater than either. For merely nutritive purposes, therefore, alfalfa hay is about three times as valuable as corn silage, but a combination of the two would be much better than either alone.

SILOING DRY CORN.

I would like to have your opinion in regard to filling a silo with well eared, dried fodder corn. I have been informed that dry fodder would not keep in an air tight silo.

Bowers, Wis. O. P. C.

We have never tried siloing dry corn; others have, and report a fair measure of success. But it must be thoroughly and evenly wetted as it goes into the silo. For this purpose, put a keg on the cutter or elsewhere, so arranged that a suitable stream of water will fall on the corn at the foot of the carrier.

On the whole, we do not feel warranted in recommending the practice of putting well cured corn into the silo, and this more especially to those who have not had considerable silo experience and are able to judge as to amount of water required.

A VERMONT RATION.

Having been a trial subscriber to your journal for the past five months, and liking it very much, I remit $1.00 for my subscription for one year.

Please send a balanced ration for my cows, mostly fresh, weight about 800 pounds, consisting of mixed hay, corn fodder, corn meal at $17, bran at $18, gluten feed at $23.

My milk goes to a creamery which furnishes cream only. G. W. E.

Bradford, Vt.

Prices for feed seem to be very high, and we fear the middlemen are levying too much royalty, either in the way of excessive profits or too many of them. As a rule, we believe in patronizing home or near by merchants, but there are times which demand going more directly to the sources of supply. Try corresponding with some of the dealers in feed, who advertise in our columns.

Meantime, we do not see how one could expect to do much better with the feeds and prices named, than to adopt something like the following:

FORMULA FOR RATION.	*Dry Matter.*	*Digestible Nutrients* Protein.	Carbohydrates	Ether Extract
12 lbs. mixed hay	11.30	.58	4.75	.19
8 lbs. corn stover	4.76	.13	3.23	.06
4 lbs. bran	3.52	.50	1.54	.12
4 lbs. gluten feed	3.69	.82	1.94	.16
Total	23.27	2.03	11.46	.53

SILAGE HEATS.

We filled in due season last fall. Was ten days filling silo 10×14×22 feet inside. Corn was green and wet when put in; was kept level and well tread during the time.

Opened the seventeenth of December, 1898, and fed once a day till May 8th, 1899. In April we first noticed it being warm, although it was in fine shape, and cattle doing fine on it. At the last of feeding, it was very warm. We put on 125 pails of water, covered with about four inches of sawdust, and gave that a thorough drenching; and left it till July 1st. When we opened it again, none was spoiled; on top it was cool and in fine condition. For two or three days back it has begun to warm up fully as much as before. There is now about six feet in depth. What will be the result to fill on top of what we don't feed.

Would you advise wetting down before filling on top of it? W. L. P.

Cambridge, Vt.

W. L. P. sends two inquiries on one piece of paper, and the result is that while one is being answered by an expert in swine husbandry, the other fails to reach the proper desk to receive an early answer.

The silage heats because the oxygen in the air gets to it, but there was an excess of moisture. If the top of the silage had been kept covered so as to exclude the air, there would have been much less heat. Let the new corn be put in above the old silage, but do not add any more water.

EFFECT OF PUMPKIN SEEDS ON FLOW OF MILK.

A subscriber, at Fowler, Indiana, asks whether feeding the seeds with pumpkins will tend to decrease flow of milk. We can only say in reply that there is a popular belief that such results follow, but there does not appear to be any scientific foundation for it. More than this, we have known many dairymen who feed pumpkins freely without removing the seeds and have never noticed any shrinkage in the milk flow.

HOLSTEIN CATTLE FOR BUTTER PRODUCTION.

A. D. H., Baraboo, Wisconsin, asks whether we consider the Holstein-Friesian a first-class breed of cattle for butter production. The records which have been published in this paper, from time to time, show beyond the possibility of successful contradiction, that Holstein-Friesians are "a first-class breed of cattle for butter production."

CROPS FOR EARLY GREEN FEED AND SOILING.

As I do not want to pasture my cows next season, but soil same, will you kindly advise what to put in on corn ground this fall to make early green feed in the spring, after which I will plant peas and oats. Thirty acres of flat pasture land only gave me thirty to forty days feed the past season, and I cannot afford it. Can you suggest any thing better than the following: Twelve acres rye now; early in spring as possible six acres peas and oats, thirty days later six acres peas and oats, thirty days later six acres peas and oats where the rye was, and the balance peas and oats. I also usually have plenty of ensilage left to feed during the summer; will use the last to-day that was put in 375 days ago. E. H. M.

Oswego, N. Y.

Rye furnishes the earliest green feed in the spring, but unfortunately does not last very long. Winter wheat comes a little later, and does not mature so rapidly, but has the disadvantage of killing out very easily in winter if not protected by snow or mulching. Oats and barley, especially the latter, may be sown very early and pastured for a time, and then turned under for a later crop.

We suggest trying some cow peas or soja beans in the corn next year, to be cut into the silo with the corn and thus add to the protein.

Feeding silage 375 days after it was put into the pit ought to set some people to thinking how they can checkmate the drouth.

BOOKS ON FEEDING AND DAIRY MANAGEMENT.

In reply to a Tennessee reader who is soon to take charge of a herd of thirty cows and is desirous of learning more about feeding and managing these cows and caring for their product, we do not hesitate to recommend him to purchase Prof Henry's book on Feeds and Feeding, which costs $2. and Gurler's American Dairying, at $1. For the accommodation of our readers we keep these books on sale, although we prefer to send them out as premiums for club lists of subscribers, as per advertisement on pages 643 and 644.

If it is not convenient to get the subscribers, the books will be sent on receipt of the publisher's price as above.

Prof. Henry's book contains the feeding tables inquired for.

MILKING QUERIES FROM OREGON.

Would like answers to the following questions:

1. Do you consider the practice of milking with the back of the thumb against the teat pressing the thumb knuckle against it, injurious. Is that method likely to secure the best flow of milk.

2. Would you consider a cow well milked when one to two gills of milk could be secured five minutes after milking.

3. Would excessive wetting the teats with milk be allowed in a well conducted dairy.

Yamhill Co. Ore. JESSE EDWARDS.

No. 1. We do not think the way of milking above described is to be commended, although we have personally known a few first-class milkers who followed it. They were women, and it was, perhaps, almost a necessity with them. There is no good reason why a man should practice such a method of milking, as there is positively no advantage in it and the chances for injury to the teats are much increased.

2. Cows differ in this respect. If not more than a gill of milk was obtained, we should say the cow was well milked. If much more than that we would personally milk the cow a few times so as to be sure whether the cow or the milker was at fault.

3. No wetting of teats whatever is allowed in a well conducted dairy, except to wash them when necessary, and then they should be wiped dry before milking is commenced.

SILAGE GETS COLD.

Enclosed find one dollar for your paper for 1899. If you can, without too much trouble, I would like you to answer the following questions: Three years ago I built a square silo 12×12, 30 feet high, inch boards matched and two in thickness. First year my corn went in a bit too green; second year same, on account of hail and frost; last year filled it with Leaming corn, ripe enough to put in shock—corn that run over one hundred bushels per acre. My silage after using off the top ten feet, got cold. If you can give me the cause and a remedy, I will fill again, if not, I will give up in despair. I have the corners cut off and my silage keeps well, but cannot feed much on account of it being cold and hurts my cows in cold weather. Have no paper between boards. Would it help to reline it? H. R. D.

Homer City, Pa.

A lining of paper would doubtless help somewhat in retaining the heat, but we beg H. R. D. not to "give up in despair" because the silage gets cold. If the silage keeps well he may depend that whether cold or warm, it is a good feed and will not injure his cows. If they did not do well there was some other cause contributing thereto.

It will help very materially to retain the heat to keep the silage covered with straw, canvas or boards.

FEEDING FOR CREAM.

I am making cream for the creamery. Will you please give me a grain ration that will produce cream, and also keep a cow in a healthy condition and not force her. I am now feeding Quaker Dairy Food and bran. Your paper has excited my interest in sensible feeding. G. R. H.

Bristol Ferry, R. I.

The old proverb is that "well begun is half done." When one has really had his interest enlisted in regard to sensible feeding, he certainly is well along on the way to the desired goal. *Sensible* feeding implies something more than the mere measuring out of specific quantities of hay and grain, and placing same within reach of the cow. Compounding a balanced ration does not embrace the whole art of feeding. For one thing, the sensible feeder will watch his cows much as a mother watches her children, and at the first appearance of a disordered appetite, will look about for a corrective. Some mothers will resort at once to the medicine chest, while others will look somewhat more carefully after the diet. In these days, and especially in all mild cases, the latter method is considered the wiser practice, both in the home and in the cow stable.

The analogy we have attempted does not stop with simply regulating the diet for the purpose of correcting physical ailments. It should never be forgotten by the sensible feeder that the cow is a mother and that milk giving is purely a maternal function. Outside of very narrow limits, it is quite impossible to change the character or quality of the milk by change of diet, and this especially with regard to its proportion of fat. Some cows are born to give milk containing five per cent of fat and some to give milk containing only three per cent of fat, and, feed as one may, neither cow can be made to yield four per cent milk. By withholding feed or not furnishing feed containing the milk-making elements, we can reduce the quantity of milk yielded and thus reduce the total yield of fat; and conversely, by increasing the feed or by combining feeds in proper proportions we cause the cow to give a greater quantity of milk, and thus, and only thus, can we appreciably increase the total yield of fat, or cream.

Coming then to the specific question submitted we have to say that the kind and amount of grain to be fed will depend upon the character of the cow, and the length of time the cow has been milking and the character and quality of the roughage With plenty of clover hay, the Quaker Dairy Food and bran will be very likely to suffice, but if the roughage is largely timothy hay and corn stover, we should be disposed to use some linseed oil meal, cotton seed meal, gluten feed or gluten meal. With neither silage nor roots, our preference would include at least some of the linseed oil meal, notwithstanding the exorbitant prices at which it is quoted.

Quaker Dairy Food is a new name to us and we are unable to find its analysis. Quaker Oat Feed has been on the market for some years and approximates bran in quality.

The following suggestion will show the trend of our thought.

FORMULA FOR RATION.	*Dry Matter.*	*Digestible Nutrients* Protein.	Carbohydrates	Ether Extract
20 lbs. timothy hay	17.36	.56	8.68	.28
4 lbs. bran	3.52	.50	1.54	.12
2 lbs. linseed oil meal	1.82	.59	.65	.14
2 lbs. cotton seed meal	1.84	.74	.34	.18
Totals	24.54	2.39	11.21	.72

If it would cost appreciably less, three pounds of gluten feed might be substituted for the two pounds of cotton seed meal, and if half the hay was clover, take out one pound of the cotton seed meal or one and a half gluten feed.

HAIRY VETCH.

This is a plant that is causing considerable attention from dairy farmers. It is an annual and belongs to the valuable family of legumes, and is classed in its effect on milk production with red clover, alfalfa, peas and other legumes. In the opinion of many who have tried it in various portions of the North it is perfectly hardy. A recent publication issued by the Department of Agriculture at Washington, has the following to say on this plant:

"This annual leguminous plant is a native of Western Asia. It has been cultivated for about fifty years in some parts of Europe, especially Southern Russia, Germany and France, and was introduced in this country for the first time about 1847 under the name of Siberian vetch. Excellent reports as to its drought-resisting qualities and its adaptability to our climate have been received from Washington, Nebraska, Georgia, New Mexico, South Dakota, Minnesota, Montana and Pennsylvania. Hairy vetch may be sown in autumn from about the middle of August to the middle of September, or in the spring from the latter part of April to the middle of May. If the seed is sown in drills in the latter part of August, the crop should be cultivated several times. It will furnish some forage in autumn, and where the winter is not too severe will start to grow again in the spring, thus producing forage in late autumn and early spring, at the two periods when it is most needed."

THE COW AS A MANUFACTURER.

What She Does With Her Food.

HOW SHE BEATS HER BROTHER STEER.

The term manufacturer is used here in an illustrative way, and is correctly applied in the sense that the cow manufactures milk solids out of hay and grain or other raw materials. How many readers of the *Rural New-Yorker* fully appreciate the wonderful transforming power of the bovine mother, which was given to her primarily that she might feed her young, and which man's skill in breeding has developed far beyond the needs of its original purpose? While I was at the Maine Experiment Station, we carried on a study of several dairy breeds. Among the animals which were tested, was a little Jersey cow, Agnes, weighing about 870 pounds. She was neither remarkable nor unusual, but was simply a high type animal, of which we have in this country many equally as good. I take her as an illustration of what a cow can do, simply because we measured her work, and I can refer to her performance without danger of error, and as one that is attainable by first-class animals.

Between September 13, 1888, and September 18, 1890, Agnes gave 13,080 pounds of milk, containing 1,975 pounds of solids, or 6,540 pounds of milk per year, containing 987 pounds of solids. Taken as a simple statement, this production seems scarcely worth comment. Let us look at it in the light of comparison. As stated, this cow weighed about 870 pounds. She was rather lean, and her tissues undoubtedly contained as large a proportion of water as Lawes & Gilbert's "well-fed ox," so that the dry matter in her entire body would not be over 295 pounds. It is clear then that Agnes manufactured in a single year milk solids equivalent in weight to the dry matter in the bodies of at least 3.4 cows of her size and composition.

It is also interesting to note how this little cow's productive capacity measured up to that of her brother steer. In 1895, the Maine Experiment Station analyzed the entire bodies, (skin excepted) of two steers, weighing alive 1,300 pounds and 1,280 pounds. These animals were about thirty-three months old. It was found that their bodies contained 475 pounds and 449.6 pounds of solids, an average of 462 pounds. This puts the steer in a rather bad plight as a manufacturer, for it shows that it took him 2¾ years to construct as large a quantity of animal solids as the cow produced in about 5 3-5 months. But the case is even worse than this, for milk solids are wholly edible, whereas only 58.3 per cent of the dry matter of these steers' bodies was found to be so. This being true, and edible milk solids having about five-sixths the energy value of edible beef solids, the cow accomplished as much in one day, towards supplying the human family with motive power, as the growing steer did in 8½ days. Assuming that it cost half as much to feed the steer from calfhood to the age of three years as did the cow for the same length of time, the food cost of beef as human food was, in the cases cited, four times that of milk. It seems, then, that as a transmuter of "the grass of the field" into a high-grade animal food for human consumption the cow and the steer are not in the same class.

FUEL AND FOOD.

All manufacturers operating machinery find it necessary to use fuel in order to obtain motive power, and our cow is no exception to this rule. There were many days when Agnes ate approximately 15.5 pounds of digestible dry matter and gave twenty pounds of 15.5 per cent milk. Some of this food was returned in the milk solids, but the larger part was burned as a source of energy to run the cow's machinery and keep her body up to its normal temperature.

We measure the energy of food by a heat unit, which we call a calorie, this representing the heat necessary to warm one pound of water though four degrees Fahrenheit. In terms of work, this heat is equivalent to 1.53 foot tons, or the raising of 1.53 tons to the height of one foot. The available energy in Agnes's daily food amounted to 30,000 calories, or over 45,000 foot tons. The energy of the daily milk solids was about 8,000 calories, leaving 22,000 calories to be used to run the manufacturing machinery, and furnish body heat. Dr. Armsby and others have found that a 1,000-pound steer, doing no work and making no growth, needs a daily energy equal to 13,000 calories, and doubtless, our cow, under similar conditions, when not giving milk, would need no more. This leaves 9,000 calories to be charged up against the specific effort of milk secretion. In other words, the work of producing milk after allowing for milk solids and the usual wear and tear of the body, requires the combustion of three-tenths of the nutrients digested from an ordinary milk ration.

MILK VERSUS BEEF.

The greater food cost of beef over milk works itself out in commercial conditions. When the New York city millionaire buys hygienic milk for his growing boys and girls (if he happens to have any), at eight cents per quart, and tenderloin steak for himself at twenty-five cents per pound, he pays from twenty-five to twenty-six cents for a pound of edible milk solids, and not far from sixty-one cents for a pound of edible beef solids or in proportion to the energy of the two foods, practically twice as much for the beef, as for the milk solids. The same general relation holds in our villages where milk sells for five cents and decent steak for fifteen to eighteen cents. Milk is unquestionably the cheapest high-class animal food which the market offers. This is a truth not generally appreciated by the public. To the rich, it is not an important matter, but to our laboring classes, in restricted or moderate circumstances, it is. Yet how often we find a mechanic's wife priding herself on her economy in purchasing but little milk, and then freely patronizing the butcher's cart at current prices. Even the families of the farmers who produce the milk, often use it as an article of diet in very limited quantities.

Certainly a cow is an economical accessory to every family where one may be kept conveniently. As a rule, the cost of food and care is less than the cost of milk from the peddler's cart, and for this reason, any mechanic who can do so will practice economy in keeping a good cow, especially when he can dispose of his surplus milk to his neighbors.

THE RAW MATERIAL.

It is worth while to inquire what relation there is between the raw materials used by the cow for the production of milk and by the steer for growth. The elaborate experiments of Lawes & Gilbert and others have taught us that, so far as animal fat is concerned, the steer can build it from the cheapest and most abundant class of materials which the farmer produces, viz., the carbohydrates. For many years the source of milk fat was in doubt, most agricultural chemists inclining to the view that it was formed either from the food fat or protein, or both. Now we are warranted in the statement that the steer has the cow at no disadvantage, for it appears that she is able to make twenty-five cent butter from the same raw materials that the steer uses in producing five-cent suet. There is still a general agreement that, so far as muscular tissue and casein are concerned, they have a common origin in the food proteids.

Now how shall we care for this wonderful food maker? First, we should treat her kindly, even with a touch of affection, for she will respond with affection, and will yield willingly her daily tribute to a considerate master. She has a sensitive nervous system—the better the cow, the more highly strung. The man or boy who kicks her should be made to blush with shame, for he is not a fit companion, much less a proper caretaker of this friendly brute. We must feed her well, not too well, but enough. Let us keep her quarters neat, clean and comfortable, and give her sunlight and pure air. We must not tie her by the head all winter long, with no chance for exercise, but we should allow her to tone up her physical condition by a judicious amount of liberty. It is time to put our foot upon the fad of giving cows no winter exercise, especially those that are to be mothers of future cows. If we do all these things, and then our cows do not do their share to help feed and support us, it will be because we own the wrong ones.—W. H. JORDAN, in *Rural New-Yorker*.

THE Illinois Jersey Cattle Club will hold its annual meeting in the Assembly room of the Dome Building on the State Fair grounds in Springfield, September 26th, at 4 p. m. Not only members of the club, but all Illinois breeders of Jerseys are invited to be present.

Crimson Clover.

Crimson Clover (*Trifolium incarnatum* L.), also known as scarlet clover, German clover, Italian clover, and carnation clover, is an annual plant, native to southern Europe and has long been cultivated as a forage crop in the warmer portions of that country. It is an erect, tufted plant, one to two feet high, with soft-hairy stems and leaves, and usually bright scarlet flowers in elongated heads. The root system is well developed and penetrates deeply into the soil and the plant is a vigorous grower. The seed is larger than that of red clover, oval in shape, bright reddish-yellow when fresh (paler in the white-flowered variety) and has a highly polished surface. The plants stool freely, many stems arising from a single root.

Several varieties are recognized in Europe, distinguished chiefly by the color of the flowers and the time required by the plants to reach maturity. Very little attention has been paid to these different varieties in this country. A white-flowered variety is sometimes seen on the market, but as a general rule only one sort is recognized by seedsmen and this is usually sold under the name of crimson clover.

CONDITIONS OF GROWTH.

Crimson clover will not stand severe freezing although it is one of the so called "winter annuals" and under favorable conditions makes much of its growth during the cool, moist weather of fall, winter and early spring. Its strong growing roots enable it to secure nourishment in many soils so poor and thin that red clover would fail entirely. While requiring a warm climate, it will not endure severe drouth. It thrives best on rich, rather sandy loams; but, when the conditions of moisture and temperature are favorable, it gives good results on light sandy soils as well as on clays if they are not too stiff and cold.

Crimson clover has come into prominence in this country within comparatively recent years. It can hardly be regarded as a successful crop outside of the region from New Jersey west to the Alleghany Mountains and south to eastern Tennessee and Texas. True, good yields are often obtained in other sections, but cannot be depended upon year after year. In the middle and south Atlantic States this clover is one of the best crops that can be grown for forage and soil renovation. It has given good results in many portions of the Gulf states but many failures are also reported. In the colder sections of the country this clover is sometimes successfully grown as a summer crop but it usually winter-kills badly when sown in the autumn. At the experiment stations in Rhode Island, New York, Ohio, Michigan, Illinois, South Dakota, Nebraska, and other states in the North and West, the general results of tests show that it is too tender for the climate and is less valuable than red clover. From results recently obtained at the Alabama Experiment Station it seems very likely that in many cases, especially in the South, failures with this crop are to be attributed to the absence from the soil of the tubercle-forming organisms which are necessary for the proper appropriation of nitrogen by the plant.

These organisms being supplied to the soil, excellent crops were obtained where without them the result was a failure.

PREPARATION OF SOIL.

There are many ways of preparing the soil for this crop, depending largely upon the purpose for which it is intended. Little if any fertilizer is needed, except what may be used in connection with the clover to prepare the land for the next crop in the rotation. On very poor, worn-out soils it is usually a good plan to give a moderate application of phosphate and potash. When crimson clover follows a cultivated crop like corn, no preparation is necessary other than that of the cultivation of the corn or other crop. When the clover follows a crop of small grain it is usually necessary to plow the land and this should be done just before the time for sowing the seed. Cloddy land should be well pulverized before seeding. A fine seed bed is essential to uniform germination.

SEEDING.

It is extremely important that a farmer should sow none but *fresh* seed. It is an easy matter to test the germinating power of the seed; it requires but a very short time and is well worth the while of every farmer intending to sow in any quantity. Good fresh seed should germinate ninety to ninety-five per cent and under the proper conditions the sprouting should take place within three days. American seed has given much better results than the imported, on account of its greater vitality. The amount of seed sown per acre varies from ten to twenty pounds, depending largely upon the character of the soil and the use to which the crop is to be put. Rarely a smaller quantity may be used. The common practice is to use about twelve or fifteen pounds.

The seed may be sown broadcast or with a drill. The former is the most common in practice, perhaps largely from the fact that the clover is so often sown on land already occupied by corn, potatoes or some other crop. The seed is often sown by hand, sometimes from horseback, but better results will usually be secured by the use of some machine like the Cahoon broadcast seeder.

Throughout the middle Atlantic states and the South generally, crimson clover may be sown any time from July fifteenth to September fifteenth, and if the moisture conditions are favorable it may be sown still later in the Gulf states. As a rule the best results are obtained from seed sown in July and August. The seed may also be sown in the spring, but, except in the colder northern states or for some special purpose, the results are much less satisfactory. In the North, spring sowing is necessary if this crop is grown at all. It may sometimes be grown to advan-

"To Err is Human."

But to err all the time is criminal or idiotic. Don't continue the mistake of neglecting your blood. When impurities manifest themselves in eruptions or when disordered conditions of stomach, kidneys, liver or bowels appear, take Hood's Sarsaparilla. It will make pure, live blood, and put you in good health.

Hood's Sarsaparilla
Never Disappoints

Cabbage and Turnip May be fed to your cows without leaving a disagreeable flavor in the milk if you have a Champion Milk Cooler Aerator in your dairy. Our book about it free.

CHAMPION MILK COOLER COMPANY,
67 Main St., Cortland, N. Y.

tage in this section as a temporary crop in place of red clover.

Some farmers do not cover the seed at all; but many failures have resulted from this method, attributed by some to heavy rains immediately after the seed is sown but more likely due to the exposure of the tender, unprotected plants to the hot summer sun. When its use is practicable, the roller s an excellent implement for covering the seed. It presses the seed into the soil and insures uniform germination. A light harrow or a brush drag may also be used.

HARVESTING.

Crimson clover may be harvested in the same way as common red clover. It is sometimes difficult to cure properly, as it is ready to cut at a time when wet weather is likely to interfere. It may be cut for hay as soon as it comes into bloom and should never be cut for this purpose later than when it is in full bloom. The hairs upon the calyx of the flowers become hard and stiff as the plant matures and are likely to prove troublesome to animals eating hay, forming "hair balls" in the stomachs of the animals, which sometime cause death. When harvested for the seed, cutting should take place as soon as ripeness has been reached to avoid loss through shattering. It is also well to thrash the crop or put it under cover as soon as it is dry, as heavy rains may injure the seed by causing it to sprout in the head.

Under average conditions, from eight to fifteen tons of green, or one and one-half to three tons of cured forage may be obtained from an acre of crimson clover. Very poor soil or drouth may result in a lighter yield, while as high as twenty tons are reported under favorable conditions. The yield of seed per acre usually ranges from eight to twelve or fifteen bushels.

FOR HAY.

When cut in proper season and well cured, the hay is, if anything, superior to that of red clover, having much the same chemical composition and a somewhat higher percentage of digestibility. It is relished by all kinds of stock, and is very highly prized for feeding to animals that are required to do heavy work. Its nutritive ratio varies from 1:3.5 to 1:4.

FOR SOILING.

Crimson clover is an excellent crop for this purpose. It is ready for use some time before red clover, and at a time when there are few other forage crops at hand. It is particularly valuable for this purpose on dairy farms. In experiments made at the New Jersey station, nearly one and one-half tons per acre of digestible food, valued at twenty-five dollars were secured. A ton of crimson clover, in proper condition for soiling, contains about 325 pounds of dry matter, of which about five and one-half pounds of crude fat, fifty of crude protein, and 150 of carbohydrates are digestible. Rape is sometimes sown with the clover when a soiling crop is desired, and the resulting forage is excellent.

FOR PASTURAGE.

This crop readily lends itself to use for pasturage, especially in the early spring. It may be used alone or in connection with winter rye or rape. At the New Jersey Experiment Station it was estimated that an acre of crimson clover, six inches high, contained "sufficient food to properly nourish twelve cows for one week."

FOR SILAGE.

This is one of the best of the clovers for use in the silo. The yield of forage is large, is easily handled, and it makes a better quality of ensilage than most other legumes commonly grown for this purpose. The silage is especially valuable for feeding dairy stock.

FOR GREEN MANURE.

This is one of the most important uses to which this crop can be put. Its season of growth is such that it can be used without in any way interfering with the production of the primary crop of grain or vegetables, and it affords a large amount of fertilizing material. The herbage is heavy, the roots are abundantly produced and penetrate deeply into the soil, and together these form a large amount of vegetable mold, exerting a benficial effect on the physical condition of the soil as well as adding much nitrogen, and other valuable elements of plant food to the surface soil, where it will be available to corn, wheat and other crops, It is estimated that the average crop of crimson clover is worth from $15 to $30 per acre for the fertilizing value of the nitrogen alone. An important advantage which crimson clover has over cow peas as a fertilizer, lies in the fact that it decays more readily, and is less likely to "burn" the soil when a heavy crop is turned under. Another advantage arises from the possibility of producing the crop of clover between the time of harvesting the regular crop of one season and the planting of the next. It may often be used along with cow peas to good advantage, the cow peas being used as a summer crop and followed by the clover for the winter.

AS A SOIL COVER.

In many sections of the country, especially where the soil "leaches out" or washes badly, it is imperative to have the land covered with vegetation during the time it is not occupied with the primary crop, particularly during periods of heavy rains. Crimson clover is particularly well adapted to use as a cover crop. It may be sown in corn, tobacco, potatoes, cow peas, sorghum, and many other crops after the last cultivation, and, when these are removed, will come on and occupy the land during the fall, winter, and early spring and may be pastured off or plowed under in time for the planting of the next crop. It is an excellent cover crop for use in orchards, where it is also one of the best of sources of nitrogen for the trees. Crimson clover in the orchard reduces the amount of cultivation necessary to keep the weeds in check, and if the crop is not needed for fertilizing the soil, it can be cut for hay, soiling, or silage. The roots and stubble left on the ground from a crop of clover, cut when in full bloom at the New Jersey station, contained nearly forty pounds of nitrogen, over ten of phosphoric acid and over fourteen of potash per acre. When the crop is allowed to mature, the potash in the roots and stubble is increased, but the nitrogen and phosphoric acid is reduced. This crop can be used in connection with small fruits as well as with peaches, pears and apples.

SUMMARY.

1. Crimson clover is an annual, not adapted to use in permanent meadows and pastures, and too tender for successful general cultivation outside of the Middle and South Atlantic and Gulf States. It thrives best in warm moist loams of at least moderate fertility and makes most of its growth in the fall and early spring.

2. The seed should be sown in late summer or early autumn (July 15th to September 15th), at the rate of from ten to twenty pounds per acre on a well prepared seed bed. It may be sown alone or with other crops, a frequent practice being to sow with corn, potatoes and like crops at or after the last cultivation. The seed may also be sown in the spring, but the results are not as satisfactory as when sown as above stated.

3. Crimson clover has a high feeding and fertilizing value, and is one of the best crops that can be grown in short rotations for forage and soil renovation, lending itself readily to use for hay, pasturage, soiling, silage, green manure, and as a soil cover to prevent leaching and washing.

4. The crop should be cut for hay at or before full bloom, and for seed as soon as ripe; in the latter case it should be threshed or put under cover as soon as dry.—*Bulletin U. S. Department of Agriculture.*

Influence of First Mating.

The *London Live Stock Journal* thus refers to the results of a series of experiments begun to ascertain whether the first impregnation influences the progeny of a female, when bred to a different sire:

"A most interesting feature of the Edinburgh show was the collection of zebra hybrids exhibited as extra stock by Prof. Coccar Ewart. The sire of most of these animals, the zebra Matope, a nine-year-old, was on view, but as might be expected, the chief center of interest was his hybrid offspring. Among these was Romulus, the first hybrid ever produced by crossing an ordinary mare with a Burchell zebra, and he stands twelve hands, two and one-half inches at the shoulder, and is broken to saddle and harness. The dam of Romulus was also in view, she being a West Highland pony. Her first foal was Romulus; then came one by a gray Arab, and her third is by a pony of her own breed and color, and showed at birth faint markings, as did her second on the hind quarters, but it is mentioned that other foals of the sire Loch Corrie do the same, but there are no traces of the zebra hoofs, mane, or tail. Then came Nora, a Shetland pony, which in 1895, had a bay foal, by a Shetland sire, which was richly striped; in 1897, she bred a hybrid; in 1898 a foal by a Welsh pony, of which the foal was an exact likeness, and this year a hybrid. They prove that the stock of Nora are not influenced by a previous sire."

Previous reported tests, in the case of hogs, are exactly contrary to the results obtained in the instances referred to. We note also, that both Agassiz and Darwin, who made very close and long-continued investigations, believed that "later impregnations do not efface that first impression." It is a very interesting question for breeders, and we do not believe the instances mentioned above settle the matter. There will have to be more and broader experiments.

How Old She Looks

Poor clothes cannot make you look old. Even pale cheeks won't do it.

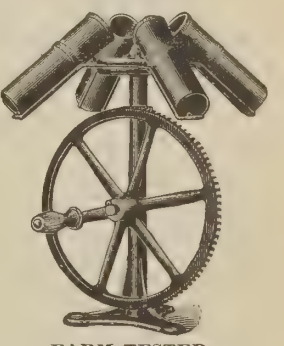
Your household cares may be heavy and disappointments may be deep, but they cannot make you look old.

One thing does it and never fails.

It is impossible to look young with the color of seventy years in your hair.

Ayer's Hair Vigor

permanently postpones the tell-tale signs of age. Used according to directions it gradually brings back the color of youth. At fifty your hair may look as it did at fifteen. It thickens the hair also; stops it from falling out; and cleanses the scalp from dandruff. Shall we send you our book on the Hair and its Diseases?



The Best Advice Free.

If you do not obtain all the benefits you expected from the use of the Vigor, write the doctor about it. Probably there is some difficulty with your general system which may be easily removed. Address, DR. J. C. AYER, Lowell, Mass.

Be Careful

To read article on page 488, issue of Aug 4, HOARD'S DAIRYMAN, regarding the Use of Babcock Testers in Cheese Factories.

We were the first manufacturers to make a tester in which to test milk after the method devised by Dr. Babcock, and we have always retained the first place in the list of manufacturers. The Farm Style, Factory Hand Style or Factory Motor Tester are the best made. Full descriptive catalogue, with directions for operating, free.

Rural Free Delivery of Mail.

How to Secure It.

ED. HOARD'S DAIRYMAN:—We are anxious to secure a free rural delivery route from Brillion to Wayside, but find it difficult to get influence to bear on the right officials. Who would be the proper ones to bring influence to bear on? Any information would be thankfully received. This is a thickly settled country, but it is back from the railroad, and free delivery would make it seem less so. MARTIN O'BRIEN.

Kasson, Wis.

Rural free delivery of mail is being established in a few localities by way of experiment and to gather statistics for presentation to Congress. The conditions precedent to the establishment of such a route are, that it shall traverse a section of country where there are comparatively good roads at all seasons of the year; that it shall be from eighteen to twenty-five miles in circuit, and shall not involve travelling over any considerable part of the distance a second time;that there shall be not less than about 150 families living on the route or within a mile of it; and that they shall be largely of that class who would appreciate and patronize such service. Creameries, cheese factories and school houses on the route, which the people, or their children, visit every day, or frequently, and could thus get their mail, are additional favorable features.

As a rule, the member of Congress from the district in which the proposed route is located,is the proper person to apply to. In the case of this particular inquiry, this would be Hon. James H. Davidson, of Oshkosh, and, in order that he may act intelligently, there should be a petition prepared setting forth the facts and bearing the signatures of people interested in the project, and especially of such as are representative citizens. This petition should also be accompanied with a map or sketch of the proposed route, showing the cross roads and location of dwellings, school houses, etc. It is not necessary that this map should be elaborate or absolutely correct in all its details, but it should show in a general and fairly accurate manner all the main features of the locality.

We write somewhat advisedly on this matter, having been concerned recently in securing the establishment of a Rural Free Delivery Route from Fort Atkinson, service on which was commenced on Monday of the present week.

From a Dairyman Student.

ED. HOARD'S DAIRYMAN:—Although keeping only two cows, I can say that the DAIRYMAN has helped me to obey the injunction, "Be thou diligent to know the state of thy flocks and look well to thy herds." (Prov. 27: 23.) Our cows have done unusually well, not only because they are good cows, but also because their keeper is a HOARD'S DAIRYMAN reader. Ever since we received the DAIRYMAN, others in the neighborhood have commenced taking through our solicitations. For a fly cure for the cows, we are now using shoo-fly pretty successfully. I believe dairying to be one of the few *honest* trades in the world. We are well pleased and satisfied with the Jerseys; we have no trouble in selling their milk, for those that care more for quality than cost are among our customers. We keep our cows clean, the barn clean, and do not believe in allowing milch cows to become fat (or thin either.) We are also strict as to quietness at milking time. The pasture here seems to be giving out under the scorching rays of the sun, but we continue to feed good mess of grain, hay (and corn stalks when on hand) at night. Thanking you for all your helpful information, RAY C. TUTTLE.

South Englewood, Ill.

Price of Milk at Elgin Condensing Factories.

ED. HOARD'S DAIRYMAN:—The Gail-Borden Condensing Company contracted for milk this morning for the ensuing six months, for its factories at Elgin, Carpentersville, Algonquin and Belvidere. A small advance was made in the price offered the farmers, and the patrons were certainly disappointed, as they had reason to expect more. However, the company had no trouble in securing the necessary supply, as the dairymen had no alternative. They have their herds on their hands, and all of the facilities required by the condensing company. Some declare that they will go out of the business as soon as they can arrange matters without too great loss, while others are still hopeful for better conditions in the future.

The company pays $1.25 per hundred pounds for the months of October, November, December, January and February, and $1.10 for March. This is an average of $1.22½. The price for the corresponding months of last year average $1.15.

The Elgin Butter Company contracted for its supply of milk to-day at 11 cents a gallon for October, November and December and ten cents for January, February and March, an average of 10½ cents. This price many of the dairymen consider better than that offered by the condensing company.

Elgin, Ill., H. C. B.

Our Special Elgin Letter.

ED. HOARD'S DAIRYMAN:—The offering of butter aggregated 3,600 pounds. All bids were at 22½ cents. Eighteen hundred pounds were sold at 22½ cents and the balance was withdrawn, with the price offered.

There was but one sale:

Factory.	*Pounds.*	*Price.*
Sun Prairie.....	1,800	22½c.

The sales for the corresponding week of the three preceding years were as follows:

Sept. 19, '98, 8,640 lbs. of butter sold at 20c.
Sept. 20, '97, 9,720 lbs. of butter sold at 20c.
Sept. 21, '96, 48,300 lbs. of butter sold at 14@15c.

The New York market Monday was reported firm at 23 cents. H. C. B.

Elgin, Ill., Sept. 18, 1899.

A SAMPLE OF HOW OLEO IS SOLD IN CHICAGO.

Clerk at Randolph Market Persists in an Attempt to Deceive a Woman.

Last Monday the writer met Mr. F. E. Lonas, one of the Illinois Dairy Union's attorneys, and suggested to him that inasmuch as he is trying the oleomargarine cases he should see how the fraud is perpetrated in Chicago. Being near Randolph street, it was decided to visit the store of C. E. Horrie, known as the "Randolph Market," at 72 Randolph street.

In this store is a fine display of oleomarine prints, shown in the original boxes, the internal revenue regulations forbidding its sale otherwise. So far as could be observed there was not a sign of butter in the place.

Upon a large placard near the door was a sign reading:

"ALL GRADES OF
OLEOMARGARINE 12½c."

Then was marked prices of dairy butter, 15c; Wisconsin creamery, 18c; and "Fancy Elgin, 20c." While we were looking around a woman came in and asked:

"Have you any nice dairy butter?"

"Yes ma'm," promptly replied the salesman.

"Let me see it," she said.

Going to a box of oleomargarine packed in rolls, he brought out a roll. Evidently she was on the lookout for deception, for she asked:

"Is this butter?"

"It's the 'real thing,' madam, was his misleading reply.

"What's it worth?" she asked again.

"Fifteen cents a pound."

And he went to the counter to wrap it up.

"That's oleomargarine, madam," I said to the lady. "He's trying to fool you."

She was indignant in a minute.

Going over to where he had started to wrap it up, she asked:

"Is that oleomargarine?"

"You can taste it for yourself," he replied holding the roll out to her.

"But I don't want it if it's oleomargarine," she protested, "no matter how it tastes."

"Well," replied the clerk, who was beginning to get a little rattled, "can't you tell by sampling it whether you want it or not?"

"I don't want oleomargarine," she indignantly protested, whereupon she left the store as mad as a wet hen, and the clerk took the roll back to the box and put it away.

Meantime I had been recognized by one of the head salesmen, who had been putting up some meat in the back part of the market. He saw what was going on and vainly endeavored to call the clerk away from his customer, but the young man couldn't understand him and persisted upon waiting upon the woman.

Following the indignant woman across the street the writer presented his card and informed her that the proprietors of this place were being prosecuted and that they were swindling their trade generally as they attempted to swindle her.

"I hope you will send them to the penitentiary," she cried, and her eyes fairly blazed with indignation. "All such people ought to be behind the bars."

The scheme of the Randolph Market's owners in displaying a sign advertising all grades of oleomargarine at twelve and one-half cents per pound is a ruse to lead the public to believe that the higher priced goods are pure butter. In fact, "Fancy Elgin Butter" is advertised at twenty cents, and is a well known brand of oleomargarine.

The fact of the place having been made notorious, by the prosecution of its proprietors by the Illinois Dairy Union, has made this ruse necessary in order to keep the wool pulled over the eyes of the public.—*Chicago Produce.*

Condimental Food.

(Press Bulletin.)

The State Experiment Station has recently received for examination, a sample of "Horse and Cattle Food," manufactured by the Rochester Horse and Cattle Food Company, of Rochester, N. Y. It is offered for sale in Pennsylvania at the rate of 14 7-12 cents per pound in twelve-pound lots, and at eight and one-half cents per pound in lots of 200 lbs. It has a dark color, bitter saline taste and somewhat aromatic odor; the microscope reveals numerous particles of charred material and wheat starch grains. Its composition is not very different, as regards the materials for which concentrated feeds are bought, from that of a mixture of equal parts of winter wheat bran and Buffalo gluten feed.

	Horse and Cattle Food.	*Mixed Wheat Bran and Gluten Feed.*
	Per Cent.	Per Cent.
Moisture.....	8.8	10.1
Ash.....	11.3	2.9
Protein.....	14.2	17.3
Crude fiber.....	12.8	7.5
Nitrogen-free extract (starch etc.).....	44.3	53.9
Fat.....	8.6	8.3
	100.0	100.0

For practical purposes, the latter mixture is about as good a food as the "Horse and Cattle Food," and with winter bran in bulk at Pittsburg costing $15.50 to $17 per ton, and gluten feed in bulk, costing $16.50 at Buffalo, the cost of the mixture would be about one cent per pound. The added condiments have little medicinal value and well animals, it has been found by repeated careful experiment, utilize no more, if as much, of their food when condiments are added.

Penn. Exp. Station. WM. FREAR.

How the Danes Keep up the Quality of their Butter.

Dr. Eichloff, the German government expert at the experimental laboratory, in Keil, who has just completed a journey in Denmark—made to investigate dairying—in a long article to the official German dairy paper, asks the question, "How is it that the butter in the Danish Dairies is so very seldom faulty?" and gives the following as the reason:

1. In Denmark the dairy farmers take the greatest possible care that the milking is done with as much cleanliness as possible, also that the milk is cooled and stored carefully, so that the creamery receives a perfectly faultless material to work with.

2. In the Danish creameries the most scrupulous cleanliness is observed, both as regards the creamery itself, its surroundings, vessels and utensils.

3. In the Danish creameries all cream intended for churning is pasteurized.

4. The pasteurized cream is cooled to the lowest possible temperature.

5. The Danish buttermaker considers it of greatest importance that the ripening milk is sound, and that it gets strongly pasteurized.

6. In Danish creameries lactic ferment is always used for ripening the cream.

It is especially the first two reasons I ask you to make notice of, as I observe that you in the last number of the *Farm and Dairy* have referred to an article published in England, entitled "The Truth About Danish Dairying," which article stated that the Danish creameries were not kept clean.

I may also mention that at the time of the publication of this article the Danish dairy farmers were not satisfied until a commission was appointed in England to visit Denmark and investigate and report as to the veracity of the statements contained in this article.

Needless to say that the commission returned, reporting that no creameries could possibly be kept cleaner than the Danish.—L. W. MARCKER, in *Farm and Dairy.*

The Intent of the Ten Cent Tax.

There probably never was a law framed which some people did not misconstrue, and, perhaps, with the best of intentions. It is impossible to write a rule which all men will interpret correctly, owing, in part, to the individuality of the man. One man thinks the weather is pleasant, and another is sure it is "beastly." This is illustrated in the oleomargarine discussion which is now taking place.

While all honest men concede that oleo should be sold for what it really is and for nothing else, a few understand that the proposed ten cent tax is designated to be prohibitive, and that it is the same as enacting a law forbidding the making of oleomargarine.

The proposed law does not tax the manufacture of oleomargarine designed to be sold for what it really is, ten cents a pound, or any other sum. It taxes the act of coloring it to resemble butter, so that it can be sold for butter. It does not prohibit the making of oleomargarine, but does prohibit carrying on a fraud. It is designed, not to crush out oleomargarine, but to crush out fraud. Of course, if it is impossible to sell oleomargarine, except by fraud, then the proposed law will suppress oleomargarine, and in that event it ought to. If the opponents of the proposed law really mean what they say—and probably some of them do—that no man should be allowed, dishonestly, to sell oleomargarine as butter, nor should he be prohibited from making oleomargarine, then they really concede the justice of the ten cent tax, and the absolute necessity for that kind of legislation, and they only oppose the

A Low Wagon at a Low Price.

In order to introduce their Low Metal Wheels with Wide Tires, the Empire Manufacturing Company, Quincy, Ill., have placed upon the market a Farmer's Handy Wagon, that is only 25 inches high, fitted with 24 and 30 inch wheels with 4 inch tire.

This wagon is made of best material throughout, and really costs but a trifle more than a set of new wheels and fully guaranteed for one year. Catalogue giving a full description will be mailed upon application by the Empire Manufacturing Company, Quincy, Ill., who also will furnish metal wheels at low prices made any size and width of tire to fit any axle.

GOING TO FEED CATTLE

or hogs or both this season? There is no better fence made for surrounding feed lots, barn yards, or the farm in general than THE ADVANCE FENCE. Perfectly smooth, all interwoven, safe for stock. SOLD DIRECT TO FARMERS AT WHOLESALE. Nobody can buy it any cheaper. Write for circulars and special discounts. ADVANCE FENCE CO., 126 Old Street, Peoria, Ill.

CLOSING OUT SALE

OF

Jersey Cattle

KIRKSVILLE, MO.,

OCTOBER 16th, 1899.

The Entire Herd owned by DR. C. E. STILL, consisting of 130 Head, will be sold to the Highest Bidder.

This is the chance of your life to get a bull calf to head your herd; send your bid to the auctioneer if you cannot attend. No postponement on account of weather.

SEND FOR CATALOGUE.

FRED ZIMMERMAN, Manager.

law through misconception of the situation. The proposition is to leave the legitimate manufacture and sale of oleomargarine as free as the making of butter, requiring no more or less than that it be made to show what it really is, and so be sold for what it really is. It is dishonest to color with intent to deceive the purchaser and make him think it is butter, and this is the feature, which, in all justice, ought to be prohibited, and the feature which the ten cent tax is intended to prohibit.—*Creamery Journal.*

DAIRY MARKETS.

ELGIN, Ill., Sept. 18—Sixty tubs offered, thirty withdrawn, thirty sold, 22½c; official market firm, at 22½c.

CHICAGO, Ill., Sept. 18—Creamery, extra, 22c; firsts, 19@20c: seconds, 15½@16½c; dairies, selections, 17c; No. 1, 15c; No. 2 14c; extra ladle, 13½@14c.

Cheese—Full cream, Twins, new, good to choice, 10¾@11c; young America, 11@11½c; Swiss, 9½@11½c Limburger, 8@9¼c; brick, 9@10½c.

Eggs—Fresh, at mark, cases returned, sold at 13@13½c loss off; cases returned 15½c.

Bran—In moderate demand and sold at $11.50 @12.50 per ton.

Cattle—The general cattle market was weak and 10c lower. A few of the choicest natives sold steady, but no strictly prime beeves were offered. The best on sale sold at $6.45, against $6.70, the top last week for prime steers. Most of the native steers sold at $5 40@6.25 or 60@75c higher than a year ago. Corn-fed Western steers sold at $4.65 @6.40; grass Westerns, $4.25@5.25 for steers and $3.65@4.70 for cows and heifers. Straight Texas steers sold at $3.60@4.10. About 7,500 grass Westerns and 1,000 Texas cattle numbered among the receipts. Native butchers' stock generally sold 10c lower Feeding cattle sold a shade lower, largely at $4.00@4.45.

MILWAUKEE, Wis., Sept. 18—Butter—Creamery, fancy prints, per lb 22½c; extras, 22½c; firsts, 21@22c: seconds 20@21c; imitations, 19@20c. Dairy, selections, 17@18c; lines, 16@17c. Market remains steady; receipts, 11,770 lbs. and all descriptions salable.

Cheese—American full cream, new choice to fancy, 10½@11c; brick, new, choice, 10@10½c: Limburger, new, choice, 9½@10c; Swiss, new, drum 11@11½c; block, 11@11½c; No. 2, 9½@10c. Market strong and trade fair; receipts 11,390 lbs.

Eggs—Fresh, per doz, 15c, loss off, cases returned. Market unchanged: receipts 308 cases.

MUSCODA, Wis., Sept. 18—The offerings on the Lone Rock and Muscoda Dairy Board of Trade were 1,240 boxes Twins; all sold at 10¾c.

PLYMOUTH, Wis., Sept. 12—Sales, 925 Twins at 10¼c, 200 Twins at 10⅝c, 25 Americas at 10⅝c.

BERLIN, Wis., Sept. 9—The sales reported were 354 boxes Twins at 10c. The offerings were by six factories.

MANITOWOC, Wis., Sept. 13—Offerings of cheese at the Dairy Board of Trade to-day were 900 boxes Daisies, 150 boxes Twins, 950 boxes Young Americas. All offerings were sold, Daisies and Twins at 10 cents. Young Americas at 10¼ cents.

FOND DU LAC, Wis., Sept. 18—Offerings, 625 Twins and 500 Daisies; market active at 10½c for Twins.

SHEBOYGAN FALLS, Wis., Sept. 13—The usual number of factory men offered 1,293 boxes of cheese on the call board to-day, and all except 279 boxes were sold as follows: 375 cases Young Americas at 10⅝c; 175 at 10½c; 74 Twins at 10¾c, and 390 Daisies at 10⅝c. Market quiet.

NEW YORK, Sept. 18—Butter—Creamery, western extras, 23c; firsts, 21½@22c; state extras, 23c; firsts, 21@22c.

Cheese—State, full cream, small, colored, fancy, 11⅛@11¾c; white. 11¼@11½c; large, colored, 11¼c; white, 11c,

Eggs—State, Pennsylvania and western, 18½ @20c.

CANTON, N. Y., Sept. 11—There were 1,800 cheese sold here Saturday at 11@11½c and 900 tubs of butter at 22c.

FULTON, N. Y., Sept. 11—Today 17 factories were represented on the board. Large cheese sold at 11c; small at 11¼c.

OGDENSBURG, N. Y., Sept. 11—1,200 boxes of cheese were offered. A bid of 11c resulted in no sales, but later on the street all were sold at this price.

NORWICH, N. Y., Sept. 11—The sales of cheese were: 160 boxes of large colored at 11½c; 460 boxes of small colored at 11¼c; 511 boxes small white at 11c; 163 boxes small colored skims, at 10½c. Sales of butter were 25 packages of creamery at 21c and 30 packages of dairy at 19c.

WATERTOWN, N. Y., Sept. 9—70 boxes large white were sold at 11¾c. On the curb the sales were 1,246 boxes of large white at 11@11¾c; 300 Twins at 11⅜@11¾c. Buyers, as a rule, refused all cheese at over 11c. About all the purchases were made by Canadians.

LITTLE FALLS, N. Y., Sept. 11—For the first time in several weeks, there was no advance in the price. The sales were 1294 lots, 5,193 boxes, at 10¾@11c. The sales of butter were very light.

UTICA, N. Y., Sept. 11—In view of higher prices in New York, sellers on the Utica board today anticipated a slight advance. Buyers of large colored, however, were inclined to be conservative.

Following is a list of sales: Lots, 135; boxes, 9,525; prices, 10¾@11¼c.

The transactions on Sept. 13, 1897, were 4,954 boxes with the ruling price 9c. The transactions on Sept. 12, 1898, were 5,578 boxes with 6¾c the ruling price.

The butter market showed an increase. The sales were: 10 packages at 21½c; 18 packages at 22c; 83 packages at 23c. The quotations for prints is possibly a fraction over 25c.

PHILADELPHIA, Pa., Sept. 18—Butter—Solid-packed separator creamery, extra, 23c; firsts, 21 @22c: seconds, 18@20c; imitation creamery, extra, 18c; firsts, 16c; seconds, 14c; ladle-packed, extra, 16c; firsts, 15c; seconds, 14c; print butter, creamery, extra, 24c; firsts, 23c; seconds, 19@20c.

Eggs—Pennsylvania and nearby, 18c; western, 17½@18c; southwestern, 16@17c; southern, 16c.

BALTIMORE, Md., Sept. 18—Butter—Market firm; creamery separator, extra, 23@24c; extra first, 22@23c; first, 21c; creamery, imitation, extra, 19@20c; ladle, extra, 18c; western, store-packed, 13½@14c.

Eggs—Market firm; strictly fresh stock, 16½ @17c.

ST. LOUIS, Mo., Sept. 18—Butter—Firm; creamery, 19@23c; dairy, 14@18c.

Eggs—Steady; 14c.

BOSTON, Sept. 18—Butter—Creamery, extra, 23½c; western, extra, 22c; dairy extra, 20@21c; imitation creamery, 15@17c; western ladle, 15½c; print creamery, 23c.

Eggs—Fancy nearby, 24c; choice fresh, 19@20c; Michigan extra, 18c; western, 17½c; fair to good, 16@17c.

KANSAS CITY, Mo., Sept. 18—Butter—Creamery, 21c; dairy, 16c.

Eggs—Fresh, 13½c.

CINCINNATI, O., Sept. 18—Butter—Firm, 23c,

Eggs—Firm, higher; 14c.

Cheese—Good to prime Ohio Flat, 11@11¼c,

NEW ORLEANS, La., Sept. 18—Butter—High grade creamery, 24c; storage, 21c; demand good; stocks moderate.

Eggs—16c.

Cheese—Cream cheese, 12c.

WASHINGTON, D. C., Sept. 18—Butter—Market firm. Extras, 23½c; firsts, 22c; seconds, 20c; imitations 18c.

NEWARK, N. J., Sept. 18—Butter—Market steady 23c for fancy creamery. Receipts more liberal.

Latest quotations for fancy creamery:—Buffalo, 22c; St. Paul, 22c; Minneapolis, 22c; Detroit, 23c.

NEW YORK MARKET.

NEW YORK, Sept. 16—Butter—Receipts for the week, 32,623 packages. Exports for the week, 1,397 packages.

Our market was advanced to 25c early in the week, and extra fresh creamery makes were quick taken at this price, and at the close are scarce and wanted. Trade in all other grades, however, was slow, and buyers taking only enough to supply their immediate wants. Holders of butter are firm and believe that present prices will be maintained if not advanced later. We quote:

Creamery, extra, 23c; medium, 21@22c; poor, 18@19c. Dairy, extra, 21@22c; medium, 17@18c; poor, 15@16c. Ladle, extra, 16@16½c; medium, 15@15½c; poor, 13@14.

Cheese—Receipts for the week, 31,831 boxes. Exports for the week, 4,676 boxes.

Quiet markets both here and in the interior of the state. Receivers and factory men are firm and refuse to accept lower prices. We quote:

Full cream, large, extra, 11¼c; medium, 10½@11c; poor, 8@9c; small, extra, 11¼@11¾c; medium, 10½@11c; poor, 8@10c. Part skimmed, extra, 10@10½c; medium, 8@9c; poor, 6@7c. Skimmed cheese, 6@7c.

Eggs—Receipts for the week, 52,571 cases.

The market continues strong for strictly fresh stock and prices are advanced full 1c per dozen since our last. We quote:

New York and Pennsylvania, best marks, per dozen, 19@20c; northern and western, 18@18½c; ordinary marks, 14@17c.

177 Chambers St, DAVID W. LEWIS & Co.

BALTIMORE MARKET.

BALTIMORE, Sept. 14—Butter—The receipts of separator creameries this week, although limited almost, if not absolutely, to the regular shipments, mostly on contract, from the high grade districts, for distribution among the consumptive demand, have been ample for all wants, and perhaps at the close there may remain a few parcels over, as every effort to anticipate the inevitable marking up of prices, with goods that are not burdened with the last flighty advance, it resisted, and with as much spirit as would be evinced against the enforcement of some galling ex post facto law. In order to relieve the shock of advancing figures somewhat, there always are, fortunately for the receivers, here and there, mildly defective parcels with which some slight liberties can be taken; and thus good comes from evil, and by the following week the buyers have grown accustomed to the high sounding figures. Gathered cream products are still in lighter supply than demand, but the grading generally is lower; many of the favorite marks that throughout the summer showed a steadiness of grade that was at once a surprise and satisfaction, and which pushed some of the separators for place, have suddenly grown very faulty, and are neglected by a class of traders, who, much against their custom, prefer freezer stock ladles at even higher prices. Imitation and ladles are very scarce. Exporters have no fresh orders, and it is not at all likely that they will receive any for fresh goods; it would be in order for some of the liberal shipments of August to find their way back here for a market, as our English cousins have a way of working our markets to their profit, and this is true of more commodities than butter. Store packed is in light receipt and good demand, but the quality is so poor that no higher prices can be reported.

Creamery Separator, extras, 25c; firsts, 22½@22c; seconds, 19@20c. Creamery, Gathered Cream, extras, 20@21c; firsts, 18½@19c; seconds, 18c. Creamery, Ohio extras, 20@21c; firsts, 18¾@19c; seconds, 18c. Creamery Imitation, firsts, 16½@17c seconds, 15@16c. Iowa & N. W. Ladle, firsts, 15@16c; seconds, 14c. Ohio & Indiana Ladle, firsts, 15@16c; seconds, 14c. Ohio Storepacked, firsts, 13c; seconds, 12@12½c. W. Va., firsts, 13c; seconds, 12@12½c. Creamery Blocks (2 lb.) extras, 24½@25c; firsts, 23@24c; seconds, 21@22c. Creamery Prints (½ lb.), extras 24½@25c; firsts, 23@24c; seconds, 21@22c. Md., Va. & Penna. Prints, extras, 20c: firsts, 19c; seconds, 17@18c.

Eggs—Eggs continue in light receipt. All receipts of choice stock are sold promptly on arrival. The demand is active for good to choice stock. Our market is in good shape, and firm at 16½@11c.

Western Md. & Penna., per dozen, 17c; Eastern Shore (Md. & Va.), 16½@17c; Virginia, 16½c; Western & W. Va., 16½c; Southern, 15½@16c

Cheese—Receipts of cheese fair; demand good; market firm.

N. Y. State—Cheddars, fine, 12@12¼c; choice, 11½@11¾c; fair, 10½@10¾c. Flats, fine, 12¼@12½c; choice, 11¾@12c; fair, 10¾@11¼c; Small fine, 12½@13c; choice, 11¾@12¼c; fair, 10¾@11½c. Ohio—Flate, fine, 11½@12c; choice, 10¾@11½c; fair, 10@10½c; Picnic, fine, 11¾@12¼c; choice, 11@11½c; fair, 10½@10¾c. Swiss cheese, fine 12@13c; choice, 11@11½c; fair, 10@10½c:

LIVERPOOL, Sept. 18—Butter—Finest United States, 95s; good 72s.

Cheese—American finest white, 22s; American finest colored, 23s 6d.

READING NOTICES.

All Reading Notices under this head are at the rate of 25 cents per line.

For Sale Cheap—Two U. S. Separators No. 1 B., and one Reid, capacity 2000 lbs. E. M. MATHEWS, Poy Sippi, Wis, 32-2

Buff Jersey wants a good milker at once. Dane, Swede, or German preferred. Address "BUFF JERSEY," Monmouth, Ill.

"ALPHA - DE LAVAL" TRAVELING REPRESENTATIVES WANTED

Believing that 1900 will be the greatest year in the history of the dairy business, and knowing that the 1900 sale of "Alpha–De Laval" separators will be more nearly universal than ever before, as there is every reason why it should be, we shall add some ten or more men to our 1900 corps of traveling representatives within the next six months.

Candidates for these positions will be considered meanwhile and applications are now invited. A De Laval representative must possess a clean record as to personal character; have a thorough knowledge of both farm and factory dairying methods, preferably acquired through practical experience; possess the mechanical aptitude essential to quickly becoming a separator expert; be endowed with the natural energy and aggressiveness constituting good salesmanship, and be physically capable of the hardest kind of hard work, as the De Laval organization has no time for anything else.

Please let applications state the full name, age, and address of the applicant; salary at present earned and salary expected; character of present employment and with whom; previous experience in creamery or dairy work; Experiment Station or Dairy School practice, if any; experience as a salesman, if any, and degree of success achieved; together with such general qualifications as may suggest themselves to the applicant, including references offered. Also whether the applicant may expect to be in New York or Chicago in some other connection before December 1st.

It is naturally desirable, of course, that the applicant possess a practical knowledge of separators. This is necessarily the case in the selection of representatives for creamery or power machine work. It is not imperative in dairy machine representation, however, where the applicant may have had experience in the handling or sale of agricultural machinery, or the establishing of agencies for same.

Please let any letter of application relate to such subject only, that it may be separately filed for consideration in this respect alone.

The De Laval Separator Company,

WESTERN OFFICES: Randolph & Canal Sts., CHICAGO.

GENERAL OFFICES: 74 Cortlandt Street, NEW YORK.

BRANCH OFFICES: 1102 Arch Street, PHILADELPHIA.

Wanted—First-class cheese maker to make American cheese. Will furnish good house. Maker must give good references. Address, JAS. MOLZAHN, Watertown, Wis. 32-2

Wanted—A situation as manager in a private dairy, by a first-class, up to date dairyman. A thoroughly competent and reliable man. Seventeen years' experience. Two years in the South. First class references. Address, DAIRY MANAGER, Landers, Floyd Co., Ga. 32-2.

For Sale—An excellent dairy farm with all stock and dairy and farming implements. For full particulars address Box 205, Tallahassee, Florida.

For Sale—Milk, butter and egg business, near Pittsburgh, Pa. Town of 25,000. Handle 250 gallons daily. Own building 40x40, four horses and wagons, boiler, engine, etc. Doing $1,200 per month, clearing $300. A modern plant. If sold by Oct. 15th, $3,000. Write G. W. L., 1616 Bayard St., Allegheny, Pa.

Farm For Sale—400 acres in garden spot of Iowa, adjoining Britt, a town of 1,600. Farm well improved; large barns, grove, flowing well. Adapted to dairying and stock raising. Cheese factory on farm, operated two seasons. Will sell at a decided bargain before Oct. 15th. Write for particulars. GEO. P. HARDWICK, Britt, Iowa. 32-3

S. W Evans, Danville, Wis., will sell at public auction on his farm near Danville, Sept. 25th a number of head of full blooded Holstein cattle Chester White hogs, horses, farm implements, etc. Write for full particulars.

Wanted—A position by a first-class buttermaker and creamery manager. Twenty years' experience. Best of references. Married. Address C. care HOARD'S DAIRYMAN.

Herdsman wanted who is a good feeder and milker, and wants steady employment. For particulars address A. J. DAUGHERITY, Streator, Ill. 32-tf

For Sale—The proprietor of a choice herd of grade Jersey cows will sell 21 head. Address Dr. N. D. THOMAS, Decatur, Mich. 32-3

For Sale—My herd of 32 grade Holstein cows all of my own raising, and bred from choice milking Durham cows. Age from 5 to 8 years. Average weight about eleven hundred pounds. Received for milk an average of $60.00 per cow last year. Bred to freshen the last week in September and during October. Will give more milk the coming year, as all are mature and freshen earlier. Milk tests from 3.6% to 4.10%. All easy milkers. No kickers or steppers. Bred to a fine Durham bull. Price $60.00 each. Herd located at city limits of Dixon, Ill. Correspond with A. G. JUDD, Warren, Ohio. 31-3

Wanted—A practical and reliable dairyman to take charge of my dairy farm, and will rent for a term of years to right party. Farm has all the modern improvements, consisting of 2 silos, stone floors (700 yds.), system of waterworks, brick creamery and a private market for all the butter at 25c in Sioux City. Cream separator and a market for cream. My farm of 200 acres lies 6¾ miles south of Sioux City, on the Missouri bottom lands. We have two cottages for help and can handle 40 cows with ease. I wish to rent as my children are too small to assist me in care of farm. A. J. WESTFALL, Sergeants Bluffs, Iowa. 30-4

To Save Doctors' Bills use "Garland" Stoves and Ranges.

For Sale—Cheap for cash. Beautiful country home. Six miles from Nashville Tenn. On good pike. 120 acres. Especially adapted for dairying. Address "P," Glencliff, Tenn.

Experienced man, married, Swiss, wants position on stock or dairy farm. Good recommendations. Address P. O. Box 171, Monticello, Wis. 31-tf

Excursion Tickets to Mystic Workers Picnic at Harvard Ill., Via the North-Western Line will be sold at reduced rates, within 75-mile radius, September 25 and 26, limited to September 27. Apply to agents Chicago & North-Western Railway.

Excursion Tickets to County Fair at Baraboo, Wis., via the North-Western Line, will be sold at reduced rates September 25 to 29, inclusive, limited to September 30. Apply to agents Chicago & North-Western R'y.

Excursion Tickets to County Fair at Jefferson, Wis., Via the North-Western Line will be sold at reduced rates, September 25 to 29, inclusive, limited to September 30. Apply to agents Chicago & North-Western R'y.

Excursion Tickets to Fall Festivities at Chicago, Via the North-Western Line, will be sold at reduced rates, from all stations, October 2 to 10. inclusive, limited to October 14. Apply to agents Chicago & North-Western R'y. 32-sp

Excursion Tickets to County Fair at Beaver Dam, Wis., Via the North-Western Line, will be sold at reduced rates from Fort Atkinson to Minnesota Junction, September 25 to 29 inclusive, limited to September 30. Apply to agents Chicago & North-Western R'y.

The Best Shooting—The shooting in Iowa, Minnesota and South Dakota this year promises to be very good as the rainfall in all these states was abundant. The best localities for chicken and duck shooting are on and tributary to the lines of the Chicago, Milwaukee & St. Paul Railway. A copy of a recent publication issued by the passenger department of that road can be had on application to Geo. H. Heafford, General Passenger Agent, Chicago, Ill., and enclosing three cents in stamps for postage. 31-2

Non-Territorial Expansion means paying rent for a poor farm. Now is the time to secure a good farm on the line of the Chicago, Milwaukee & St. Paul Railway in Marinette County, Wisconsin, where the crops are of the best, work plenty, fine markets, excellent climate, pure soft water, land sold cheap and on long time. Why rent a farm when you can buy one for less than you pay for rent? Address C. E. ROLLINS, Land Agent, 161 La Salle St., Chicago, Ill. 32.3

Excursion Tickets to Milwaukee Industrial Exposition, to be held September 2 to October 7, via the North-Western Line, will be sold at reduced rates from all stations in Wisconsin and Michigan. For rates, dates of sale, limits, etc., apply to agents Chicago & North-Western R'y. 30-sp

Excursion Tickets to the Great American Exposition, to be held at Omaha, Neb., until October 31, 1899. Via the North-Western Line, will be sold at reduced rates. from certain stations on specified dates. For rates, dates of sale and limits of tickets apply to agents Chicago & North-Western Railway. 32-sp

INFORMATION WANTED.

It is impossible to get too much information regarding the breeding and testing of the dairy cow. Every year brings a new lot of dairymen, and, also, a new crop of calves, which should be fed, milked and bred in a manner to give the largest returns. In many cases the returns will be satisfactory; others, through want of the right kind of knowledge, have not made the success which they anticipated. From both classes much valuable information can be derived; to know where and how one has failed is as valuable, as to know why another was successful. We shall be glad, therefore, if a number of the readers of the DAIRYMAN, and the larger the better, would send us answers to the following questions, taking care to give their failures as well as successes:

1. Have you tested your herd, by weighing the milk and the Babcock test, to find which were the poor cows?
2. How long did you test, and how many did you reject? (Give the whole number of the herd at the beginning of the test.)
3. Is it much trouble or expense to do this, and what plan did you pursue?
4. Have you ever taken a herd of common cows, placed a registered sire at their head, and so kept up the system, until you brought out of it a herd of grade cows?
5. What was the breed you selected, and how much more butter, cheese or milk did you get from the daughters than the original mothers?
6. Would you advise changing breeds, one after another, or breeding right along in the same line?
7. Have you ever bred the daughters back to their own sires, and if so, what was the effect on the health and dairy capacity of the grand daughters?

NOTE—We want as many short, brief answers to the foregoing, from as many different men as possible. Make the answer to each question short as is possible; simply state the facts, not opinions. Do not worry about the style or grammar of your statement. Answer each question by number, and state your experience.

A General-Purpose Cow.

How a Dairyman Looks at It.

ED. HOARD'S DAIRYMAN:—I chanced a few days since, to visit the "dairy herd" on one of the finest farms that we eastern people can afford to visit. Owned by two brothers who are millionaires, and superintended by a salaried man, I thought I might get a pointer or two—and I did.

I have always had doubts as to what was meant by a general-purpose cow, but the cows on this dairy farm, having just been brought in for milking, enabled me to get some idea. Three men milked the cows, some butter cows evidently, some beef cows evidently, but one cow, that I enclose a sketch of just the hind quarters, puzzled me a little at first.

A gentleman was going through the stables with me, and as we came to her I stopped and, as I ought not to have done, being only a visitor, said that if that cow were given me, I would not take her home.

Just then a young man that was about beginning his milking came along, and said: "That cow you are looking at isn't good for nothing."

I wondered a bit why the high salaried superintendent came to allow her to be kept on such a farm, but noticing that of the herd of fifty cows, most were general-purpose cows, I thought this cow must have some good points. I puzzled over the matter for some days after I got home, trying to think what "general-purpose" that cow was kept for.

At last it came to me. She was a racer. Great Scot! How that cow could run! With her long, gaunt hind quarters, unimpeded by an udder that counted, she could distance a cow good for nothing but to make a pound and a half or two pounds of butter per day, in a quarter of a mile.

From my standpoint, being simply a butter maker, I was right in saying that I would not take her as a gift, but millionaires can afford to keep general-purpose cows, and a sprinkling of running stock is proper.

For the benefit of all advocates of general-purpose cows, I wish to state that I can locate this cow, and I think she can be bought reasonably, or I will undertake to match her against any two-pound-a-day butter cow any where, from one to ten miles, and bet my farm against a jew's harp, on her winning.

Even money, I will back her against anybody's general-purpose cow; for although I am more than sixty years old, and have in a limited way, traveled, I never saw her equal in build for speed. Here is a chance for advocates of the general-purpose cows, to show their sand if they have any; for the editor of the DAIRYMAN knows me, and knows that I would not joke, even with a general-purpose cow man. R. S. HINMAN.

New Haven Co., Conn.

A CHICAGO CLERK'S STORY.

Says the Higher Class of Trade is the Principal Victim and the Volume of the Fraud is Immense.

The secretary of the Illinois Dairy Union last week received the following letter from an experienced clerk, which throws a good deal of light upon the oleomargarine traffic of Chicago.

The writer desires his name withheld, but it is in the possession of the Dairy Union, and there is no doubt as to the truth of the statements he makes:

CHICAGO, Aug. 30, 1899.

MR. C. Y. KNIGHT.—DEAR SIR:—I am an interested reader of your crusade against the dealers who are selling oleomargarine for butter, but think I can find flaws in your mode of procedure. I do not think there is a man in Chicago today who is better posted in the methods the grocers use to impose on their trade, than I am.

Instead of going after the butter stores down town and trying to stop them, why do you not strike at the root of the evil and stop the retail grocers, I mean those of the better class? It is very simple, for if their customers even dreamed that they sold them butterine for butter they might as well close up their stores.

During the past twenty-two years I think I have worked in nearly every first-class grocery in Chicago, and I can truthfully say that eight out of every ten have been, and are still, selling butterine for pure butter.

To better illustrate it I will cite you an instance: I recently was employed in one of the largest groceries and markets on one of the most prominent streets of the city and the class of trade we catered to was Chicago's finest. In fact, for the distance of one mile the volume of business done by the grocer and meat trade exceeds that of any other part of Chicago.

Well, in the store in which I was employed we would take in in cash from $450 to $600 on Saturdays alone, and during the time I was employed there we never sold one pound of butter, for we never had it in the house to sell. We clerks would talk among ourselves about it and would often compare notes with other clerks, and to satisfy myself, I made quite a canvass of all the stores in the mile and found only one that did not impose on its trade. Last winter I was employed in a very fashionable market and grocery and catered to a very swell trade. They had a great butter trade and sold to some of Chicago's leading families, such as merchants, bankers, board of trade men. They never bought a pound of butter in their lives. It was all butterine. They had a dispute with one of their clerks and discharged him while I was there. He expected it beforehand and had a young man come in and buy a pound of butter, intending that if they would discharge him to inform on them when he was discharged. He took the young man and another witness to the sale down to the Rand-McNally building, gave the inspectors the butterine and explained circumstances to them of how it was bought and of how long they were selling butterine for butter and how much they sold daily. Well, they told him they would analyze it and send for him when they wanted him. That was all the satisfaction he ever got. I don't say that he deserved any, but the next day a messenger called and in my presence told the firm the whole story and told them to be more careful in the future and that it was fixed all right for this time. I had at one time, and that is not long ago, a list of seventy of the leading stores in one district of the city that were selling butterine to every one of their customers, for butter. I also worked for ———, on Randolph street, and the class of trade that patronizes the down town stores know as well as you or I do what they are buying. Every one of these know they are getting butterine. It is the fashionable grocery trade that caters to the best families that you want to get after. They dare not be exposed. It would break them up in business. They would lose their entire trade, and while you are about it, why not get after those creameries in Chicago that wholesale, from wagons, butter to the grocery trade and mix in butterine with their butter? I know of one firm that would add to every sixty pounds of creamery twenty pounds of butterine and would sell as high as 100 tubs daily. I have also seen grocers take four and six forty-pound tubs of butterine at a time and scratch the revenue stamps off the tubs and place them on the counter and mark up "No. 1 Elgin Creamery" at a cent or half cent below the market.—*Chicago Produce.*

Judging Stock at Indiana Fair Grounds.

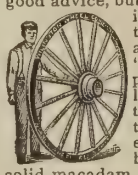
ED. HOARD'S DAIRYMAN:—The members of the Indiana State Dairy Association, and all dairymen interested in having better dairy cows, are invited to assemble on the Indiana State Fair Grounds, Indianapolis, Friday forenoon, Sept. 22, 1899, in the vicinity of the dairy cattle barns or judging ring, probably about ten o'clock.

The occasion is for educational work in stock judging.

Arrangements are nearly completed for one or two short talks on the conformation of the dairy cow, these to be followed by questions and discussion of these points.

Several dairy animals will be used for illustration and discussion.

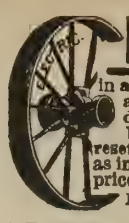
It is impossible for the dairymen of our state to attend the special courses in stock judging, feeding, etc., at Purdue, but this will give an opportunity for some practical observations and exchange of ideas.



More detailed information will be posted at the Dairy Building.

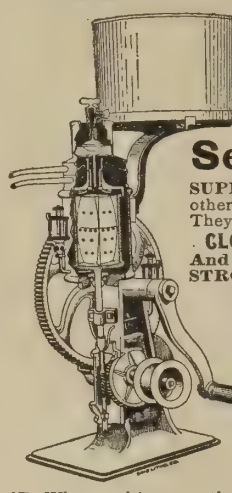
H. E. VAN NORMAN.

Illustration.



EXPENSE FOR REPAIRS.

"Keep everything in repair" is, undoubtedly, good advice, but there are conditions under which it may lose its force. For instance, take the question of the ordinary and everywhere prevalent spring "road making," where a lot of people congregate along the public highways, and "half work" out their highway taxes. The money thus expended is worse than wasted, and if it were devoted to the building of a certain amount of solid macadam each year, the roads would soon show a degree of permanency that would eliminate, almost entirely, this expensive element of repair. So it is with anything requiring repair; up to a certain point in cost, repairing may be profitable, but beyond a given point, it is positive expense. It often happens that it costs more to repair an article than it does to replace it with a new one. A case in point:



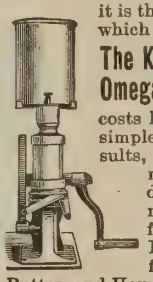
Suppose your buggy, carriage, wagon, etc., breaks down; it is presumed that the wheels have given way, for that is where a vehicle generally shows its first weakness. Perhaps the wheels need filling—needs new spokes; if to this is added the expense of new rims, and, perhaps, new tires, or, at least, the cutting and resetting of the old ones, the expense will soon equal or exceed the price of a new set of wheels.

We notice that the Wilmington Wheel Co., of Wilmington, Delaware, make a point of this fact in their ad. which appears elsewhere in this paper. We think the point is well taken, and while we appreciate and desire to encourage the disposition of keeping things in repair, we caution care on the expense connected therewith. Certainly it is better to buy a set of new wheels, if the expense of repairing the old ones approaches anything like nearly the price of the new ones. Write these people at any rate, against the time when you may need new wheels. They make a superior wheel, and sell them direct to the user at a low price for cash.

METAL WHEELS

in all sizes and varieties, to fit any axle. They last forever. Either direct or stagger spoke. Can't break down; can't dry out; no resetting of tires. Good in dry weather as in wet weather. Send for catalog & prices. ELECTRIC WHEEL CO., Box 130 QUINCY, ILL.

Eclipse Cream Separators

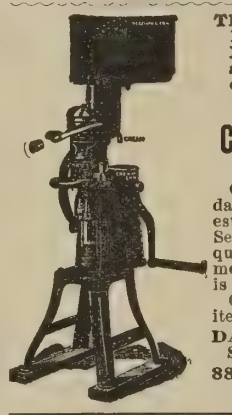


SUPERIORITY over any other make Guaranteed. They are CLOSEST SKIMMERS And Built DOUBLE as STRONG as any other make; also easiest to wash and operate. See and try one before buying. Ten sizes. Prices $30 to $600. Reliable Agents wanted. Catalogue FREE.

C. L. Chapman Separator Works, ERIE, - PA.

When writing mention HOARD'S DAIRYMAN.

If You Know



the value of a good separator, it is then only a question of which one you should buy.

The Kneeland Omega Cream Separator

costs less than any other, is simple, durable, perfect in results, guaranteed right, or money back. What more do you want? It's a money maker for every farmer. Agents wanted. Everybody, send for our free book on "Good Butter, and How to Make It." Address,

The Kneeland Crystal Creamery Co., 42 Concord St., Lansing, Mich.

The Simplicity, Durability, Perfect Separation, and Convenience of Operation of the DAVIS Cream Separator Are Perfect.

Creameries as well as dairy farmers are interested in the Davis Cream Separator, as the gain in quantity and improvement in quality of butter is wonderful.

Correspondence solicited. Agents wanted.

DAVIS CREAM SEPARATOR CO. 88-92 W. Jackson St., CHICAGO, ILL.

The YOUNG AERATOR And Cooler

Needs no water or ice, removes all odors and gasses. Warranted to keep milk sweet from 6 to 12 hours longer than any machine on the market or money refunded. Circulars free.

STYLES, CAPACITIES AND PRICES

OF THE LATEST IMPROVED

United States Cream Separators

DAIRY OR FARM SIZES.

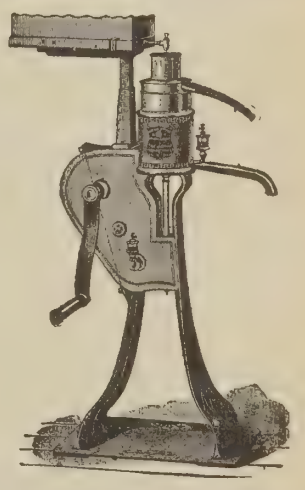
OUR connection with the United States Cream Separator commenced in January, 1891, as sole licensee. The separator at that time excelled in capacity and thoroughness of separation every separator on the market. So much so that competitors who thought they "owned the earth" were thrown into a terrible state of excitement, as they had flattered themselves that no one could make a separator but themselves, and were astonished beyond measure to find that they were excelled. Then they began to "howl" infringement and warned every farmer against buying anything but theirs and published the opinions of four firms of lawyers that every other separator did infringe, and in divers ways attempted to prevent dairy farmers from purchasing the separators of greater capacity and better skimmers.

This did not work and the United States Circuit Court later rendered a decision against them. This proved they were trying to hold trade by methods they were not entitled to. They found that dairymen relied upon the merits of the separators and not on any scares or false claims on patents.

As the United States Separator excelled they must do something to equal it if possible, and so were forced to put upon the market their "disc" machines later in 1891. This date is proved by their circular "Ten Years of Evolution."

We purchased the patents of the "triple current" United States Separators and commenced their manufacture in January, 1894.

We never manufactured hollow bowls and therefore have none to list or sell.



Our competitors did not put their full list of "disc" machines, as shown by their circular "Ten Years of Evolution" on the market until in their efforts to solve the "problem" of catching up with the United States, they were compelled to do so in 1896, but in this did not succeed and still continued to make the hollow bowl.

In their circular above referred to they admit it has been a difficult task. We quote their words, viz.:—"It has been a problem with the De Laval makers for several years how best to so convincingly demonstrate the all-around greater merit of the 'Alpha' machines."

The "triple current" United States was manufactured and put upon the market in 1894. Capacity was increased in 1896, again in 1898, and has been kept ahead of all competitors.

In thoroughness of separation the United States has always excelled.

In construction it is much superior to any others, as can readily be seen by examination. The **gears have all been enclosed** since the spring of 1894, as all machines and circulars show. In this particular the United States is ahead and always has been. For proof of this compare our would-be competitors' machines and circulars of 1895, 1896, 1897, 1898, and 1899, with ours of same years.

The United States **have high frames** except the Midget No. 7, and have had for five years. For proof, compare machines and circulars as above stated. Our "would-be competitors" advertise in their "20th Century Circular" as follows:—"Substantial supporting iron stools are now a part of the machine where no stool at all was furnished before." Showing that the United States is five years ahead in this particular.

They say further in same circular, "Gears and Spindles are protected by shields and every device added that years of practical use has suggested." Proving again that the United States is five years ahead in this line and that our would-be competitors have been compelled, as they admit, to attempt to copy our improvements. Examine the machines and every one will see that the United States is still far ahead.

The United States has used **bronze bearings** for five years.

The United States has used **steel neck bearing** in place of rubber for three years.

Every one of the points **enumerated as new** in the "20th Century" circular of our "would-be competitors" has been used in a more perfect state in the United States Separator for from two to five years, which proves beyond successful contradiction that **THE IMPROVED UNITED STATES LEADS** and others attempt to follow in its path.

The Improved United States has always given larger capacity considering price than its "would-be competitors" and will continue to do so. Notice our

Capacities and Prices for 1900 or "New Century" Separators:

No. 9, capacity 150 to 175 lbs. per hour, - Price $ 50 00		**No. 7, capacity 275 to 300 lbs. per hour, - Price $ 85 00**	
No. 8, " 225 to 250 " " - - " 65 00		**No. 6, " 350 to 400 " " - - " 100 00**	
No. 5, capacity 450 to 500 lbs. per hour, - Price $ 125 00			

We submit that the United States Separator has given the dairymen more for their money than any others and has always kept ahead in improvements and is therefore entitled to the position it occupies of being **first in their estimation and patronage.**

VERMONT FARM MACHINE COMPANY,

Bellows Falls, Vermont.

A Manly and Satisfactory Disavowal.

Miller and Sibley Justify the Confidence Earned by Many Years of Honorable Business Dealings.

It has been an open secret for some days, that the Miller and Sibley herd of Jerseys at the recent Toronto Fair and Exposition were "jockeyed" by one of the employes that were caring for them. An erroneous scale of points and a falacious method of judgment, whereby enlarged udders are given undue weight and prominence, was the temptation which led this super-serviceable employe to commit the offence which caused his employers such heavy financial loss and deep humiliation.

It is fortunate that this loss fell upon parties not unable to bear it, but still more fortunate that the owners of the herd can disavow all connection with or knowledge of the dastardly attempt to win honors by trickery or deceit, and have a reputation that fully confirms such disavowals.

The following letter, written under date of September 15th, to the President of the Toronto Fair and Exposition, is fully self-explanatory:

DEAR SIR:—We were informed, yesterday, by a gentleman who said he had read it in the daily papers, that one of our employes at your recent fair was charged with having forced the milk back into the udders of some of our cows, and that in consequence thereof, six of them were poisoned and died. We hardly need to say that this news came to us as a great surprise and shock, and that it was only after the employe in question had made a full statement and confession to us that we could believe such an act to have been possible. Although the cows that died were among the best we ever bred, or owned, or saw, and although it would have taken some thousands of dollars to have purchased them from us, yet we are glad that the tricky experiment resulted just as it did, and killed them all. We want no prizes, honors or successes of any sort unless we are justly entitled to them. For over a score of years we have been laboring zealously for the improvement of certain breeds of domestic animals. This is not the place, and we are not in the mood to dwell upon the successes we have achieved, but it may be pertinent in this connection to refer briefly to a few points, viz., that we have spared neither pains nor expense to bring our Jersey herd to the highest possible standard of excellence, that we bought the best animals obtainable for foundation stock; that we were the pioneer Jersey breeders to introduce voluntarily the crucial tuberculin test, and that from the outset we have insisted most strenuously on the importance of constitution and milking capacity, and by every means known to hygienic science have striven to attain these ends.

Without boasting, we think we may be allowed to say that by these means and by fair dealing we have gained an honorable reputation which we highly prize. Our Jersey animals were a source of pleasure and pride to us. Whether the business was successful from a pecuniary standpoint was always a matter of minor consideration. In view of all these facts, the thoughtless trick of our over anxious employe, which we hardly need say was unauthorized, unknown, and even unsuspected by either of the proprietors or by the manager, has humiliated us most keenly. We would never give our sanction to any unfair practices, even if we could be assured that they would never injure our cattle and never be discovered.

While the unwarranted and costly experiment of our employe, with the cows, would not, we presume, invalidate the awards to the males and females not in milk, yet we prefer under the circumstances not to receive any premiums whatever on our exhibit this year.

We shall give this letter to the live stock press of the country and request its wide publicity. This we believe due to your Association, as well as to our own good name.

Thanking you and your officials for your courteous treatment, we remain,

Signed. CHARLES MILLER. JOSEPH C. SIBLEY. } Props. E. H. SIBLEY, Manager.

Northern New York Pencillings.

Summer Cheese Prices in New York.—Colored Cheese.—Butter Color and Jersey Butter.—The All-Purpose Cow.—Butter and Cheese Awards.

ED. HOARD'S DAIRYMAN:—Cheese sold on the Watertown Board of Trade, to-day, the 10th, for eleven cents, "a quarter off" from last week's figures, as was expected, and the chances are more than even for another quarter drop next week; although the make at the factories, owing to the continued drouth, will steadily decline. The best authorities, however, say that neither the export nor home markets have justified the extreme high prices paid during the past month. The belief is that much of the August cheese has gone to the cold storage "man," when the making season is practically over.

Possibly, but it is not said that the extreme high price has decreased consumption to a large extent; especially, among the poor and middle classes in the cities. They have substituted something else for cheese, just as they are finding some other food to replace beef which the high price is putting beyond their reach.

Those salesmen representing nearly two thousand boxes of cheese on the Watertown market, who wanted twelve cents last week, or no sale, may now charge up the loss to their experience. Some men never seem to know the market value of anything they have to sell; and, when their product begins to advance in price, seem to believe that it will continue *ad infinitum*. When a salesman refuses the prices offered last week, in view of the conditions of the market, and prefers to "hold" his cheese for a still further "rise," he ought not to kick at his failure to realize, but his patron constituents ought to "kick" him out and elect one in his place having sufficient brains for the position.

But, what a fraud this colored cheese is anyway! Here is the cable's talk yesterday: "New York, Sept. 9th, white, fifty-three shillings; colored, fifty-four and one-half shillings." These prices reduced to United States 16 to 1, mean a difference of about thirty-six cents per hundred pounds, in favor of the colored product. Now, if this coloring deception had not been practiced, the consumers would not have been imposed upon and compelled to not only pay an advanced price for their cheese, but to eat a poorer quality, colored to imitate Jersey cheese and to hide dirt, just as they do when they buy uncolored Jersey butter or that eminating from any other breed of bovines.

Bah! what a contemptible, barefaced humbug it is this twaddle of the *Jersey Bulletin's* about artificially colored butter; and its pretense that all Jersey butter is always naturally colored enough, and that no other breed, with, perhaps, the exception of the Guernseys, of which there are but a few thousand in the country, and whose product does not influence the market to any extent, does this little thing.

If, however, we did not see its idiotic utterances copied by some papers that pretend to a modicum of intelligence and a knowledge of the market conditions, it would not pay the expense of writing and printing a word of denial. But infectious disease will spread if given an opportunity, whether from contamination with a sick Vanderbilt or a poor "Joe" of Tom All Alones. Hence these remarks.

Last fall, one day, I asked a well known Jersey breeder of northern New York to tell me about it. How do you market your butter, I asked? "Most of it goes to private families in the village here and in the country adjacent. We have contract prices, which are, as a rule, considerably above those of the New York markets," was the reply. But you have a surplus, at times, do you not? How do you market that, and what prices do you receive? "It goes to New York at the same prices as the best creamery is sold for here." Do you get any more for it because it is thoroughbred Jersey butter, when sold on the Board of Trade? "As a rule, no; sometimes we have received a fraction more than was paid for best creamery, but it did not amount to much of a sum."

Do you color your butter in summer, when the drouth has browned and burned up the pasture grass, and you are short of succulent soiling foods, or in winter, when the cows are on dry foods and silage? "Always; neither my herd or anybody's else will color their butter, especially in winter, sufficient to satisfy the demands of the market. We have individual cows, however, that will nearly do it, but the whole herd will not."

But, you know that the *Jersey Bulletin* pretends that all Jersey cows will color their butter enough, and that the market would accept it just as quickly, were it not colored artificially at all; just as soon at the tastes of the consumers were educated up to the proper standpoint. Then why do you, having a high-toned herd of registered Jerseys, color your butter in winter?

"We color our butter because the market says 'color it or else keep it at home'. The *Jersey Bulletin* man knows more about the quality of fine colored old rye, than he does about uncolored butter in our great markets. You ought not to quote him."

Last winter, while attending the institutes, I interviewed a dozen dairymen, a number of whom kept Jerseys, and not a man among them, a Guernsey dairyman included, could I find, who was not coloring his butter; and while in Albany recently, I visited a com-

FOUR SOLID COLOR BULL CALVES out of tested Dams, and sired by Diploma's Combination, sire of two tested cows. Also a few heifers for sale. J. E. TYRRELL, Marysville, O.

mission house and asked if uncolored butter was handled, and, if so, if the price for it was the same as for colored butter. The reply was: "We do not handle any uncolored butter, and so far as we know, no one is foolish enough to ship white winter, or white summer butter, either, to this market. If one were to do that, it would have to go to the bakeries, no matter how fine its other qualities. The consumers of butter here, have not yet been educated up to the point where uncolored butter is preferable to that having a June tint. When they do reach that scale, if ever, we shall probably deal in uncolored butter, provided there are enough demands for it to pay us for handling it; not before."

A groceryman whom I interviewed, said in reply to my question: "Do you handle uncolored butter? If so, is there a demand for it, and is the price the same as for colored butter?"

"No, sir. We could not sell uncolored butter at all, for what it was really worth. Rich people would not have it on their tables, while the poor people would think we were foisting lard onto them and would kick on sight of it."

Do not the consumers know that butter is artificially colored during the winter season?

"As a rule, all intelligent buyers do, but there are some poor people who never saw a cow milked nor know how butter is made, who do not, but they would be the first to kick were we to offer them uncolored butter, at any time. In fact, it would be hard work to induce them to taste it. We could not make them believe that we were offering butter at all, but some kind of white grease instead. There are some high grade buyers, however, who say at times, 'That package is all right except it has been colored a little too much.' But why do you ask? Are you a dealer who proposes handling uncolored butter?"

No, sir. I am merely a newspaper man, looking after facts connected with the butter markets.

"What paper do you represent?"

"HOARD'S DAIRYMAN."

"Oh, yes, we have that and find it a valuable exponent of high class dairying. I suppose, however, that not many farmers take it."

Oh, yes, they do, that is, the best element among the dairymen do, and there is a long list of men in other professions who take and read it. There are merchants, lawyers, manufacturers and even farm laborers who read it each week.

It goes into nearly every county in the United States, while its foreign "edition" is very large, its clientage extending to Australia, the Sandwich Islands, South America, Europe and even to South Africa, as you will observe if you scan its correspondence columns closely, from time to time.

But I wished to interview you more particularly on this butter color question, because of the assertion of the *Jersey Bulletin* that only butter of inferior quality was colored and for the purpose of hiding dirt and imitating Jersey butter which, it pretends to believe, is never artificially colored.

"The *Jersey Bulletin*! Where is it printed? I never heard of it. But, no matter, if it does not know that all butter that comes to our great markets in winter, is more or less artificially colored and that if it were not, it would have to go for cooking butter, it does not know much about the butter markets in this state and is not worth mentioning as an authority."

"It is the only paper I ever heard of that pretends that butter is colored to hide filth and inferior quality and its editor must be either a chump or else has a lot of gullible readers. Glad to have met a representative of the DAIRYMAN. If there is anything I can do for you, command me."

On page 637, *Rural New Yorker* of Sept. ninth, is an article by Dr. W. H. Jordan, of the New York Experiment Station, which should be kept in type on the standing galley of every thoroughbred dairy paper to be reprinted once a month, and I hope to see it in the DAIRYMAN. There are facts and figures given there that ought to silence all the pop guns that the dual or all-purpose cow writers and editors are firing, and which show clearly that beef and milk cannot hibernate under the same skin and make a success of it. One or the other must go, nor stand not on the order of their going. They can't dwell together there in harmony, nor for the betterment of the granger who owns and milks the bovine. Let him choose which he will have—butter or suet, and it were best that he reads and ponders well the doctor's article before he invests his shekels, else he may make a mistake, because when it has been proven that a good cow can make twenty-five cent butter and more of it from the same raw materials that a steer uses in making five-cent suet, there is no room left for "argerin" as to which is the most profitable to produce suet or butter.

The figures which the doctor presents also show that, even with the western cheap land, cheap corn, cheap pasture, and other cheap cattle foods, man must have the best of thoroughbred beef type and care for them carefully and well, to be able to enter the lists for profit, when the special-purpose dairy cow confronts him in the markets. The plea put forth by the *Breeders Gazette* "David" of *Farm* and *Fireside*, McLean Smith and others, for the all-purpose cow, falls flat when assailed by such a man as is Dr. Jordan. If the all-purpose cow is "no good" for a dairyman in New York or Wisconsin, surely she is not wanted on the great ranges or in the fields of the grain raisers of Iowa.

If those western men want beef let them plant and cultivate beef; if butter, it were better to plant butter seed of some true type, then cultivate and care for as Dr. Jordan advises. He should also sell his dog and invest the proceeds in bran, as H. E. Cook, of Denmark, N. Y., says he has done. A lazy hired man, accompanied by an ambitious "dog" will give a herd of dairy cows more exercise than they really need, especially when the hour is late and the hired man wants the milking off his hands, and himself on his wheel.

The awards for butter and cheese at the state fair, which closed at Syracuse, yesterday, again places northern New York well at the front, particularly in the cheese department, Lewis County again capturing a large per cent of the prizes, with Jefferson, a close second. St. Lawrence, either did not enter the cheese list, or else the tryer found her product different, as but few awards went there. The score above 94 points, follows:

ST. LAWRENCE COUNTY.

C. E. Giffen, Depeyster, 97½; Westley Reed, Depeyster, 97½; A. W. Overacker, Gouverneur, 98; I. Phillips, North Hammond, 96; Rhodes Babcock, Rassie, 98½.

JEFFERSON COUNTY.

Fred Ferguson, Redwood, 98; Hugh Kirkland, Redwood, 96: Frank Dallinger, Omar, 98½; Mather Brothers, Belleville, 98; A. E. Gove, Pamelia, 96½; F. P. Dunnaway, East Rodman, 100; Ray F. Dunnaway, East Rodman, 97; A. E. Helmer, Evans Mills, 95½; C. B. Still, Theresa, 95; Ferd Carris, Omar, 99; Levi Snell, Depanville, 98½; Oscar Northrup, Depanville, 97½; D. Walrath, Evans Mills, 97; L. B. Gibbs, North Wilna, 96; C. O'Brien, Theresa, 96½.

HOME TRADE—LEWIS COUNTY.

C. Claus, Constableville, 94½; E. G. Graves, Lowville, 99; Mrs. J. M. Graves, Lowville, 99; B. Graves, Lowville, 97½; M. E. Fitch, Lowville, 98; F. Loucks, Lowville, 95; W. H Fitch, Lowville, 98; J. E. Knapp, Deer River, 97; W. J. Webb, East Martinsburg. 98; J. E. Murphy, Montague, 95½; E. C. Gowdey, West Martinsburg, 98; B. M. Graves, Copenhagen, 98; W. E. York Harrisburg, 94½; Mrs. W. A. Wheeler, Harrisburg, 96.

LEWIS COUNTY.

H. E. Cook, Denmark, 96½; E. J. Graves, Lowville, 97; Mrs. E. J. Graves, Lowville, 97; J. H. Searl, Lowville, 96½; Charles Pierce, Lowville, 96½; B. Graves, Lowville, 98: M. E. Searl, Lowville, 99; M. E. Fitch, Lowville, 99; W. H. Fitch, Lowville 97; George Searl, Lowville, 99; N. Keifer, Kirchnerville, 98½; C. Claus, Constableville, 95½; M. Hierley, Constableville, 96; W. J. Webb, East Martinsburg, 98½; F. C. Goudy, West Martinsburg, 96½; J. E. Murphey, Montague, 95; B. M. Graves, Copenhagen, 100; J. K. Fuller, Copenhagen, 97; Chandler Merze, Croghan, 98½; W. E. Gork, Harrisburg, 96.

JEFFERSON COUNTY.

Wm. Flath, Philadelphia, 97; F. P. Dunnaway, East Rodman, 96; Ray F. Dunnaway, East Rodman, 97; A. E. Helmen, Evans Mills, 99; Silas Bretts, Watertown, 99; L. B. Gibbs, North Wilna, 99½; L. S. Pitkin, Lorraine, 96½; George B. McMullin, East Hounsfield, 94½; F. X. Baumert, Antwerp, 97.

SMALL FANCIES.

H. E. Cook, Denmark, 98½; J. H. Searl, Lowville, 96½; C. Pierce, Lowville, 95; W. S. Keyes, Oxbow, 98; C. Hungerford, Oxbow, 96.

PHILADELPHIA CREAM.

F. X. Baumert, Antwerp, 100.

SAGE.

J. H. Searl, Lowville, 96; B. Graves, Lowville, 98; P. C. Parkinson, Watertown, 94½; C. B. Wilson, Philadelphia, 99.

It will be observed that a very large per cent of the awards went to "Little Lewis;" moreover, that the scores were very high, indeed, higher on the average, than ever before, and that Lowville is entitled to the cake, in fact several of them, but that is because W. Brown Richardson is encamped in that outpost. C. W. JENNINGS.

Bellville, N. Y.

Some Oregon Dairy Items.

ED. HOARD'S DAIRYMAN:—About one year ago, we began agitating the dairy interest in this community. A creamery was started with private capital, and has had sufficient patronage to keep it running since.

I have been living in this, the Willamette, valley, for nineteen years. Had never considered it especially adapted to dairying. Along the coast country, west of the coast mountains, has grown famous for its dairies. Tillamook cheese and butter has gained a reputation. Many have grown wealthy in the business, while we, in this beautiful valley have been giving our attention to wheat and fruit. Good as they are, dairying is far better. We have an ideal dairy country, soil and climate considered. Clover grows to perfection. Vetches grow spontaneous wherever the seed falls. Corn grows fine, when given the proper care. Only early varieties will properly mature. I have corn now that I am sure will make twenty tons of ensilage to the acre. Last year more than one hundred thousand dollars was sent east of the Rocky mountains for cheese and butter, for this northern country alone. We can make butter and cheese here in Oregon cheaper than it can be made in Illinois, by the help of God, and your valuable paper, which is such a welcome visitor, and the favorable conditions with which we are surrounded.

You will hear again from us on this line. We are now milking fourteen cows, (Jerseys, of course). Building a barn for twenty-six head; cement floor with pits to save the liquid manure; and a silo. JESSE EDWARDS.

Yamhill Co., Oregon.

DE KOL'S BUTTER BOY No. 19210. Son of the great DeKol, and Royal Paul No. 22979. Combining the blood of Pauline Paul, Pietertje 2nd, Koningen Van Friesland 5th and DeKol in one sire, head our choice herd of over 100 Holsteins. Sons ready for service, and heavy milking cows bred to them, for sale. Write now to **Dellhurst Farms,** Mentor, O.

LADY BAKER

Is the sixth highest butter cow in Holstein history. Her butter record is 34 lbs 6oz in seven days, the second largest record of the breed in the advanced registry. Her milk record is 773¼ lbs. in one day. Lady Baker sold for $800 at Mr. Wales auction sale, held at Chicago in 1889. Valley Mead Farm is in a position to give the blood of this great cow from her only son Judge Baker, who sold for $600 to Colo. A grandson of Lady Baker, called Sir Natsey Baker, stands at head of herd.

VALLEY MEAD FARM, Monticello, Wis.

SHADY NOOK HERD Holstein-Friesians Choice Chester-White Pigs 2 to 3 months old, both sexes, for sale. W. R. GATES, Ripley, Jefferson Co., Wis.

McGEOCH FARM Holstein-Friesians.

Herd headed by Gem Pietertje Hengerveld Paul De Kol and Johanna Paul Colantha. A few young bulls, 3 to 7 months old for sale at bargain prices. H. B. DAGGET, Mgr., Lake Mills, Wis

HOLSTEIN CATTLE! The Choicest Milk and Butter Breed in the World. Write to Wis. Live Stock Ass'n, Appleton, Wis., U.S.A.

OAK GROVE HERD H-F. Cattle.

Cows, Heifers and Bull Calves For Sale. C. H. Stevens, Jefferson, Wis.

High Test I offer the grand young bull Prince Mercedes DeKol, whose 4 nearest tested relatives have an average equivalent record of 24½ lbs. and 4.14% fat, and have won 1st, 2d, and two 3d prizes in H.-F. Offic'l Prize Contests. Others extra good. MALCOLM H. GARDNER, Darien, Wis.

HOLSTEIN-FRIESIAN CATTLE

Owned by **JONES & RANDALL, Hustisford, Wis.** 100 head to select from. From families rich in butter fat. Herd now headed by Barron Paulina De Kol. Stock for sale. Prices reasonable.

HOME FARM HERD.

Headed by Jewel of Home Farm, Sweepstakes Holstein-Friesian Bull Trans-Mississippi Exposition Omaha, Neb. Seventy-five head to select from. **W. B. BARNEY & CO., Hampton, Iowa.**

MEADOW LAWN HERD Holstein-Friesians.

Herd headed by **Sir Brookside De Kol.** Choice young stock for sale. Come and see them. C. W. HARRISON, Ringwood, McHenry Co., Ill.

Markham Manor Farms. Simonsville P. O., Andover, Vt.

Holstein-Friesian cattle bred from the most fashionable butter families, individually large producers, and of the most approved show form. The herd contains seven daughters of Sir Netherland Soldene Clothilde, No. 18390, H. F. H. B., the most remarkable show bull of recent years. Also large English Berkshire Swine from noted prize winning and imported stock. Write for description and prices to **J. A. THORNTON,** Mgr., **Simonsville, Vt.**

MECHTHILDE BULLS FOR SALE. Address **M. W. BARDEN,** Portage, Wis

130 Holsteins. First prize herd at Trans-Mississippi Exposition at Omaha. 1st and 2nd on aged cows and 1st. on two-year-old heifer in the seven day butter test, open to all breeds at same Exposition. Three cows in this herd have produced the most butter in seven days of any cows ever officially tested. A score of others nearly as good. Our richest bred bull calves are taken young. Sons of De Kol 2d and Netherland Hengerveld head the herd. Animals of both sex and any age for sale. Write stating just what you want. HENRY STEVENS & SONS, Lacona, Oswego Co., N. Y.

GUERNSEYS FOR SALE. The increase of my herd is a few young things of both sexes, from one to eighteen months old. Prices corresponding to age and quality. **F. W. TRATT, Whitewater, Wis.**

GUERNSEY CATTLE

SHETLAND PONIES.

Old Homestead Herd,

Of PERRY, OHIO,

Was Champion at O., Ill., and Ind. State Fairs, 1898, winning against well-known O., Pa., and N. J. Guernsey show herds. Over twice as much prize money as all competitors combined at above fairs. No better collection in America. Breeding Stock For Sale. Inspection invited. Will make a representative exhibit at the Ohio, Wis., Ind and Ill. State Fairs this fall. L. V. AXTELL, Perry, Lake Co., O.

Riverside Guernseys,

CHAMPION Herd

AT NEW YORK STATE FAIR,

1898, in competition with the leading herds of the country, won eight firsts and sweepstakes. Young stock by **COMUS,** sire of most of the winners, for sale. Thoroughbred Poultry—the best egg-producing and general purpose varieties—Leghorns, Wyandotts, Buff Ply. Rocks, Houdans. Send for circular. Stock for sale. **J. FORSYTH,** Riverside Farm, **Owego, Tioga Co., N. Y.**

ROSENDALE GUERNSEYS

Our herd has won first prize at the Wisconsin State Fair every year since 1894, and also won first at Minnesota State Fair and at the Trans-Mississippi Exposition in 1898. We keep only 400-lb. cows. Tuberculin tested.

GEO. C. HILL & SON, Rosendale, Wis.

"Florham" Guernseys.

First Prize Herd wherever shown, viz: New York State Fair, 1895 and 1897; Bay State Fair, 1895; Inter-State Fair, Trenton, N. J., 1895 and 1897; Madison Square Garden, 1895; New Jersey State Fair, 1897. **J. L. HOPE,** **Farm Supt., Madison, N. J.**

GUERNSEYS!

84 Cows averaged 399 lbs. of Butter each in 1898.

AYRSHIRES Finely Bred and from the very best families. Stock for sale, bred for milk and butter qualities. Also fine herd Chester White Swine. Correspondence solicited. FRED TSCHUDY & SON, Monroe, Wis.

Pedigreed Poland Chinas of the BEST feeding strains. Pigs at weaning $5 to $7. Also Mammoth Light Bramah fowls. K. S. HAWK, Mechanicsburg, O.

Pure Bred **Tamworth Pigs,** Bacon curers choice. Pure Bred **Ayrshire Cattle,** largest imported herd in America. Stock all ages forsale, R. G. STEACY. Box 720 Brockville Ont., Canada.

PIGS Eligible to REGISTRY, and First Class Stock, at Reduced Prices. **Chester White, Berkshire, Poland-China and J. Reds. Thoroughbred and Grade Guernseys. Also Poultry. W. B. HARVEY, West Grove, Pa.**

Is She a Delusion?

The General-Purpose Cow.

ED. HOARD'S DAIRYMAN:—I have been a student of your paper ever since I knew of its existence. I have derived a great deal of pleasure and profit from it. I do not think there is a paper published on the face of the earth that has as varied a lot of contributors as HOARD'S DAIRYMAN:—so varied in fact that one needs to be a close student of human nature to distinguish between those who are writing from theory without practice and those who are giving genuine information, derived from personal experience on a scale large enough to be profitable.

I learned early that I must frequently read between the lines, as many writers leave out the little details that really make the success of the undertaking they tell us about. To illustrate my meaning, one man will give his method of producing a certain crop and its results and forget to say on what kind of soil he was working. As a result, some one tried the same method on a different soil and made a bad failure.

Another, and a dairyman, told how he saved labor by only cleaning out his cow stable twice a week, and while in Colorado last month I saw the fellow that read it and thought he could save time and labor by moving the stable once a year.

I suggested to him that he build his hay stack through the middle of the barn and move his stanchions once a week. He replied: "By gum, I'll do it and I will write the other fellow and tell him I am two points ahead of him now. Say, Mister, stay a week with me and perhaps you can give me another pointer." Now, I have been greatly interested in the many articles written against the general-purpose cow. So many, in fact, that it has become dangerous or exceedingly unpopular for any one to say a word in her defense. Mr. Shaw was brave enough to write some good articles in her defense last winter and from the way some of your contributors jumped upon him, one would think he had committed an unpardonable sin.

I have been boiling over for some time with a desire to come to this much abused animal's rescue, but have been waiting to develop a herd that I could challenge the whole company of special purpose advocates with, and prove from start to finish that the minority can be right sometimes. I will say, I think I have the herd all right, but an unexpected ukase recently issued by the Anglo-Swiss Condensed Milk Co., prevents my issuing the challenge and demonstrating results.

The ukase states that May 1st, 1900, they will refuse to receive any milk from Holstein cows, or cows bearing Holstein markings. As a result, I must sacrifice the results obtained from years of careful breeding. I commenced farming when twenty-two years old, without any previous experience, on a farm of 210 acres.

As the interest and taxes amounted to over $1,000 per year, I discovered in the course of a couple of years that the variable prices of general farm crops made it impossible to be sure of any certain income, and as the outgo was a certainty, I began to look around for a certain way to keep the sheriff and mortgages at a respectable distance.

I decided that the general-purpose cow should be my sheet anchor and main sail. I rented 150 acres of land adjoining mine and a dairy of forty-five general-purpose cows, with an established milk route in the city of Dixon. Now, Mr. Editor, if you could see and realize what the general-purpose cow has done for me and others, as plainly as I see it, you would have a standing reward of a thousand dollars printed in great primer type, on the front page of your paper, for the conviction of any person guilty of defaming the general-purpose cow.

Why do I make that bold statement? Because she has lifted out of debt more farmers, sixteen to one, than the special purpose cows. She has done it in the past ages, and will do it for many more to come. First, she is vastly more numerous and will be for generations to come. Second, her dual qualities are being improved. Do her critics ever stop to think how much easier it is to raise a general-purpose herd, from 4,000-pound producers to 6,000-pound producers, than it is to raise a herd of specials a like amount? I did not realize it until I tried it. Now, if there are fifty general-purpose cows to one special purpose cow, and only twenty-five of the fifty belong to the progressive farmers, and are being improved, you must admit she is adding to our wealth vastly more each year than the other class.

For the first few years a fat cow was worth more than a milch cow; so I rode around the neighbors and picked out their best fresh cows, stuffed them with corn meal and hay, and in four or five months had a very desirable fat cow and not much milk; of course the butcher got her. I had got her best flow of milk and a profit from it, and another profit from her beef, and my ship sailed toward prosperity fast; but along comes the condensing factory. Everybody rushes into it, cows double in price, and all picked up or kept for miles around.

A black cloud suddenly darkens my horizon, for what will I do at the end of the next six months with a lot of fat cows on hand, and numerous customers clamoring for milk?

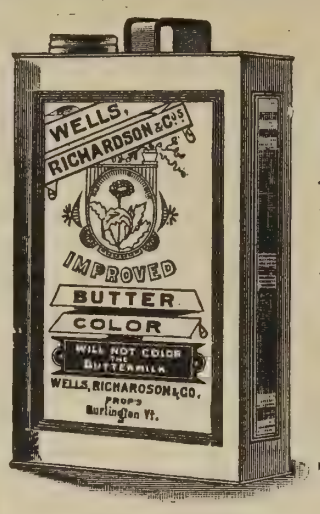
In the midst of my dilemma, a star appeared in the firmament, in the shape of a man—an agent for Thatcher's system of milk bottles and supplies. He just wanted to sell me bottles and milk pails, etc. I told him to get right out, that I was going out of business in a few months for want of milk.

He looked over my herd and remarked, "Well, Mr. Judd, I haven't seen as fine a herd in my travels, from the Atlantic to the Pacific, outside of a show ring." There they stood, forty-five great, fat, slick, shining, general-purpose cows. He asked what I fed them, and I said, just plenty of corn meal and timothy hay. (Used an eight quart milk pan for a dipper in those days, for I was always in a hurry you know.) Well he said if I would put one-third bran and one-third oats with it I would get a better flow of milk, and they would not get so fat.

Then he asked me if I read HOARD'S DAIRYMAN, and I replied I never heard of him. (I was just out of a law office and had been interested in Cooley on Torts and Gould's Pleadings, and had not run up against HOARD'S DAIRYMAN or our good friend John Gould). But it set me to thinking, and I soon got acquainted with the paper and balanced rations and improved breeding, and I went into the stable, and apologized to my cows for the many caked udders I had inflicted upon them, and a prayer for forgiveness from the noble animals I had sent into the great hereafter through the milk fever and slaughter house routes.

A car load of bran went into my barn immediately, and bran, oats, and corn meal was their ration. A field of clover and timothy furnished abundance of nice hay for winter, and corn fodder helped out the dry pastures in summer, and I had milk galore. A hundred and twenty-five dollar bull from a milking strain of Durhams furnished the supply of calves that made fresh cows, and did not have to scour the country for fifteen or twenty miles to get a fresh cow.

By this time I was taking nearly all the agricultural and dairy papers published, and studying them nights (had to work day times) and getting experiment station bulletins and books and studying breeds, and visited the best dairies in the country, and finally decided I could increase the milk flow of my herd most and quickest by selecting out twenty of my best young cows and cross them with a thoroughbred Holstein, depending upon the Holstein to increase the quantity and the Durham to retain the quality of the milk, and a medium tendency to retain the easy keeping quality of the Durham and cover up the slab sidedness of the Holstein.



It resulted in the most complete success imaginable. I had forty head, all marked black and white, that test in butter fat as high as any herd in the factory, and I expected this year to show the largest milk yield of any similar number in the country.

Now, after years of such breeding and weeding and the building up of such a herd free from kickers, steppers or hard milkers,

There is a right chimney for every lamp. The Index gives you its Number.

Your dealer should have it.

with the milk yield doubled, the testing of each individual satisfactory, absolutely healthy, raised on and wonted to the farm, gentle as kittens and handsome in form and color and such profit producers that the debt on the farm has long since disappeared and peace and plenty make life worth the living. I say under such circumstances is it any wonder it makes me sick to think of having to sell them to appease the distaste of a corporation that sees fit to condemn a whole class of individuals because some few members of that great class have not tested up to their idea of a proper standard.

Right here I will say, that owing to the opening of the condensing factory and the Henderson shoe factory about the same time, and taking in about 1000 young men and women, it drained our farms of help both out doors and in the house so that I gave up my city delivery and became a patron of the factory, as I could get along with less help.

Now in conclusion, Mr. Editor, do you wonder that I love and praise the general-purpose cow when I have had such a profitable experience with her? Then, when I see her lifting other young men all around me into homes on beautiful farms, costing a hundred dollars per acre, and paying for rubber tired surries and their family's dressing and living in style equal to the aristocracy of the cities, I am doubly convinced.

When we all know that she is doing it, not only around Dixon, but around Elgin and Fort Atkinson, in fact around every big city, is it wise or advisable to go to such extremes as many of your writers do in condeming the general purpose cow and advising the young beginner to undertake the rearing of a special dairy cow?

As I got able, I experimented along special lines and convinced myself that the improvement is so slow and failures so much more common in the thoroughbred families, on account of the high tension to which they are already pitched, that nine times out of ten the young farmer will make a failure instead of a success.

I will save you lots of printing and manuscript reading by warning those that have made up their mind to reply to this that I have not used the term *scrub* cow. I understand a general-purpose cow to be one that gives milk enough to pay a profit and can be disposed of at any time by a little extra feeding for beef, and that at a profit; that a special purpose cow is one bred so strongly in certain lines that it practically eliminates all other characteristics and can produce only milk or only beef at a profit. That a scrub is one that has no predominating tendency and is a failure for both milk and beef.

Warren, Ohio. A. G. JUDD.

Corn Hay.

About fifteen years ago at the meeting of the Iowa Improved Stock Breeders' Association at Atlantic, Professor Sanborn, then of Missouri, startled the breeders with an estimate of the amount of food that was wasted every year, by the failure of the farmers to fully utilize their corn fodder. While intelligent farmers realized the extent of this waste, there was apparently, then, no help for it. At the then current prices of labor and corn, it did not seem possible for the average farmer to do anything better, than to husk out his corn, and let the cattle get what they could. Where the farmer had a small acreage and a considerable number of cattle, he could afford to cut and utilize it, but we believed then, and we believe now, that the large farmer did the then best thing, in allowing the cattle the range of his fields during the fall and winter to gather up the missed corn, and the husks and blades that remained on the stalk. Fifteen years have made great changes, and have almost entirely reversed the situation. The corn harvester has appeared since then, and done away with the old-fashioned corn knife, and the sore arms and scratched faces that were inevitable in harvesting corn in the old way. The corn shredder has come in and enabled the farmer to utilize, to a greater extent than ever before, the product after it is harvested. Meanwhile the prairies have been plowed up, first-class prairie hay is becoming scarce, and is destined in the near future to give place to corn hay, as good a feed as the best prairie hay, and better than the average, and equal in every respect to timothy hay. In less than ten years from now, corn will take the place as horse and cow feed of both timothy and prairie hay in all the states of the west, and in many of the states of the east as well, thus furnishing a market for the heretofore largely wasted product of the Iowa corn fields, according to the scientists about forty per cent of the feeding value of the entire crop. It has only been in the last few months that we have felt safe in speaking with this degree of confidence. An article in the *Farmer* of August 25th, written last winter, reflects our views on the subject at that time. We have given the subject a good deal of attention of late, and we now feel quite positive, that with the improved shredders, such for example, as the Janney, the problem has at last been solved. Briefly stated, the situation is this:

With the corn harvester, corn can be put in shock as cheaply as it can be husked on the stalk, and with a great deal less labor and more solid comfort. This is a great step in advance. Only two questions now remain; one, the cost of reducing this corn fodder to corn hay, and the other, the best method of keeping the hay until it is required for use. It is claimed for the Janney shredder, that, and we speak of this as a typical improved shredder, ten acres of corn fodder can be husked and converted into hay in one day, and the force required is as follows:

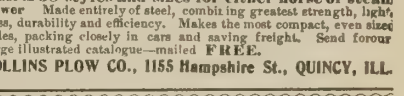
Two men to feed the machine, working in hour shifts, the second man oiling the machine and seeing that everything is in order while he is resting, one man at the engine, and a boy to haul water. These are the machine men. The number of men and teams required to deliver the fodder at the machine, and to stack or mow the hay, depends on the distance it has to be hauled, and the amount of fodder per acre on the field, and therefore, cannot be reduced to a close calculation. Estimating, therefore, the cost of running the machine, including the delivery of the corn fodder, at $12.00 per day, which we believe to be a very liberal estimate, and reducing the estimate to eight acres instead of ten, it is simply a question whether eight tons of corn are worth $12.00. We do not credit the machine with the husking, because we have balanced the husking against the cutting up of the corn. It is safe to say that the corn hay of eight acres of good corn is worth to any farmer, who is feeding good cattle, at least, $30.

We do not blame a practical farmer for abandoning a shredder if it can handle only three or four acres a day. In this case the corn hay or shredded fodder has cost about all that it is worth, but if from six to eight acres can be handled at an expense of not exceeding $12 per day, then the farmer has a clear profit in sight and he should not hesitate to invest in an improved shredder, do away with about half his meadows, increase his acreage of corn, and depend upon his corn fields for the supply of winter forage for his cattle.

The second difficulty and the one that has given us a great deal of concern is that of keeping the fodder in its best state. Corn fodder will keep anywhere if it does not contain more than twenty-five per cent of moisture and is not packed tightly in bays more than thirty feet deep. It will take fire by spontaneous combustion under the same conditions in which clover hay will burn. Seasons sometimes occur in which it is difficult to get corn hay with less than forty per cent of moisture. Under these conditions it is not safe to store away in very large quantities. The way of solving this problem is in the first place to wait until the corn is in condition to be shredded, and if it cannot be had in first-class condition then to stack it in small stacks and cover over with hay, straw or perhaps better than anything else, sorghum sown for forage. We believe by this method it is entirely practicable in any season to secure all the corn fodder in the shape of corn hay in the very best condition and add about forty per cent to the actual value of the corn fields.

We wish our readers to give this very careful attention. We have never before spoken so confidently on this point, but we believe that now we are on safe ground, and if our readers will investigate it as carefully as we have done we believe they will come to the same conclusion. We believe it is safe now for men who own threshing machines to invest in shredders and after the harvest is over convert the corn fodder into corn hay. We believe it is safe for the large farmer to invest in a corn shredder himself and for three or four neighbors to join together, invest in a shredder, and convert their corn fodder into corn hay, commencing as soon as the corn is fit to husk and shredding as needed up until the first of February. The shredding should be done as early as possible as corn fodder wastes largely through exposure during the winter. As intimated heretofore, we believe that the baler will in time follow the shredder, and that the Iowa corn fields will supply the Iowa cities, Chicago, and St. Louis, as well, with the best winter feed for horses and cattle that they have ever been furnished, in the shape of corn hay free from dust and free from foul seeds. There will be fewer heavy horses in the West when the corn harvester, corn shredder, and corn baler do their perfect work.—*Wallace's Farmer.*

The World Cannot Show Its Equal



In STYLE, CONVENIENCE and DURABILITY.

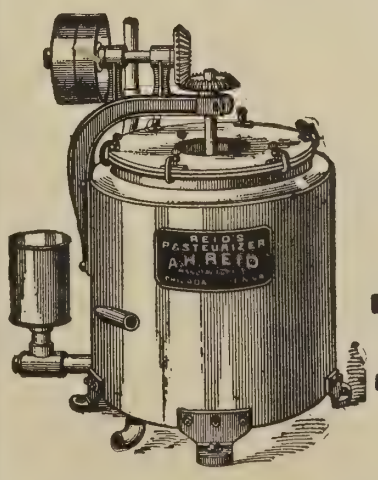
Body hangs but 17 inches from ground, and turns can be made in its own length. Sold direct to Dairyman at bed rock prices. For description and price address,

THE NATIONAL WAGON CO.,
Chillicothe, Ohio.

The Easiest Way
to market a crop of hay is in the bale.

46-IN. FEED OPENING.
The best way to bale hay is with the
"ELI" BALING PRESS.
Made in **38 styles and sizes for either horse or steam power** Made entirely of steel, combining greatest strength, lightness, durability and efficiency. Makes the most compact, even sized bales, packing closely in cars and saving freight. Send for our large illustrated catalogue—mailed **FREE.**
COLLINS PLOW CO., 1155 Hampshire St., QUINCY, ILL.

IT IS A FACT
that the best results in feeding stock of any kind are attained with ground feed. **To grind feed** most successfully requires
SCIENTIFIC Grinding Mills.
They have largest possible capacity with minimum power. Crush and grind **corn, husk cob and all,** and all small grain singly or mixed. Have self-sharpening plates. **Free**—Catalog I.
They Grind. They Last.



For Steam and Horse Power.

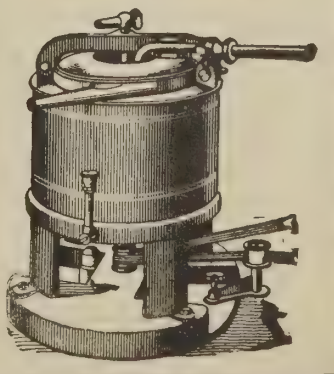
GOLDOMETOR for locating gold, silver and other minerals. In a pocket case. Also Rods and Spanish Needles. Catalogue, 2 cent stamp. B. G. STAUFFER, Dept. H. D., Harrisburg, Pa.



Poor Milk —Good Butter

Do all your patrons bring absolutely perfect milk? If not, you can't get perfect results unless you have a Pasteurizer. Pasteurization overcomes the effects of careless handling of milk and careless cleaning of cans and utensils. It removes all danger of bacteria; improves the quality of the cream and of the butter made from it, and makes both keep longer. The

REID Pasteurizer

affords scientific, practical and most economical means of pasteurizing whole milk, skim milk or cream. The Reid Long Spindle Separator Book or our new Illustrated Catalogue mailed free.

Mr. Wheaton's Canadian Dairy Notes.

Canadian Fairs.

ED. HOARD'S DAIRYMAN:—The fall fair season is always an important one in Canada. Nearly every citizen, in the older provinces especially, makes it his business to attend some one of the leading exhibitions which take place this month. This is as it should be. A fair, properly managed, is of great educational value. Even if the special attractions and proverbial side shows are much in evidence, there is always enough shown of the products of the country and of the improvement in live stock, agricultural machinery, etc , to make a visit to the fall fair of value to every farmer.

At the leading fairs here the dairy exhibit is always an important feature, and as it should be in this country, interests a great many people. The display of cheese and butter is always an attractive one, and of late years that of dairy appliances, and cheese factory and creamery equipment has become an important feature.

At the Toronto Industrial Fair, this year, which opened on August 29th and closed Sept. 9th, there was, perhaps, the largest display of dairy products and dairy machinery that has ever been seen at a Canadian Fair. There were 400 boxes of cheese shown, or 100 boxes more than last year. The exhibit of creamery butter was also an excellent one, both in quantity and quality, while that of dairy butter was twenty-five per cent larger than last year, with the quality away ahead.

Mr. A. F. MacLaren, of Imperial cheese fame, judged the cheese, and pronounced it the best lot of cheese he had seen judged at Toronto. (He has acted as judge for several years). There was a more even and better flavor and the whole exhibit was suggestive of the marked improvement that has taken place in the quality of Canadian cheese, this season. Last year's exhibit was very much lacking in flavor, while this season's exhibit, on the whole, rather excelled in that regard. Several new names were noticed among the prize winners, in both the cheese and butter classes, thus indicating that new men are coming to the front in the improvement of quality.

CHEESE AWARDS.

Section 1.—Best four factory cheese. June and July make (colored)—1. W. A McLaren, Avening; 2. W. J. Atkinson, Kintore; 3. Wm. Colbert, Lavender; 4. Thos. Stevens, Proton Station; 5. W. A. Bell, Pine River; 6. M. Knechtel, Dorchester Station.

Section 2.—Best four cheese, June and July make (white)—1. M. Knechtel; 2. Miss M. Morrison, Newry; 3. R. D. Thompson, Springford; 4. W. A. McLaren; 5. M. Morrison, Harriston; 6. E. Millson, Lakelet.

Section 3.—Best three factory cheese, August make (colored)—1. M. Knechtel; 2 R. Elliott, Dunrobin; 3. Miss M. Morrison; 4. Wm. Colbert; 5. W. A. Bell; 6. W. A. McLaren.

Section 4.—Best three factory cheese, August make (white)—1. J. W. Clarrige, Glen Huron; 2. Miss M. Morrison; 3. J S. Isard, Williscroft; 4. R. Elliott; 5. Wm. Colbert; 6. J. L. Thomson, Hawksville.

Special prizes given by R. & J. Ransford Salt Co.—1. F. E. Kline, Lakefield; 2. J. S. Isard; 3. J. S. Thompson; 4. T. B. Sellars, Laurel.

Gold medal given by the Windsor Salt Co.—N. S. McLaughlin, Henfryn, Ont.

BUTTER AWARDS.

Section 7.—Best two tubs or boxes creamery butter—1. I. Wenger, Ayton; 2. J. C. Bell, Winchelsea; 3. James Ireland, Beachville; 4. F. J. Sleightholm, Strathroy; 5. Wm. Osborne, Alliston; 6. Wm. Hope, Palermo.

Section 8—Best seventy-five pounds creamery butter in pound rolls or prints—1. J. C. Bell; 2. I. Wenger; 3. George Balkwell; 4. John Malcolm, Sheffield; 5. James Ireland; 6. F. J. Sleightholm.

Section 9.—Best sixty pounds creamery butter in packages containing not more than ten pounds each—1. Wm. Halliday, Chesley; 2. I. Wenger; 3. F. Sleightholm; 4. J. C. Bell; 5. John Ballantyne.

Section 10.—Best two tubs made in any farm dairy—1. A. C. Hutton, Brampton; 2. J. M. Dolson, Alloa; 3. J. D. Malcolm, Sheffield; 4. Mrs. M. Burk, Bowmanville; 5. Mrs. T. McKay, Hamilton, 6. A. Lake, Ranchton.

Section 11.—Best two firkins, crocks, or tubs made at any farm dairy—1. J. A. Dolson; 2. J. D. Malcolm; 3. A. Elliott & Son, Galt; 4. Wm. Whitelaw, Meaford; 5. Miss Hunter, Rockton; 6. Mrs. Burk.

Section 12.—Best basket one pound prints or rolls made at any farm dairy—1. Henry Berry, Elmwood; 2. A. Hutton, Brampton; 3. J. D. Malcolm; 4. S. Hunter, Beamsville; 5. Wm. Willis, Newmarket; 6. T. W. Stevens, Aurora.

Special prize.—American cream separator valued at seventy-five dollars, given by Richardson & Webster—Mrs. M. Burk, Bowmanville.

Special Windsor Salt Co. Prize—Mrs. Dolson.

The display of dairy appliances was indeed a fine one, and was indicative of the growing demand there is in this country for up-to-date dairy machinery. Half a dozen different makes of separators were shown, and what may be interesting to the readers of the DAIRYMAN, a good proportion of these were separators made in Canada.

An interesting and what was more important, a great educational feature of the dairy department, was the butter making competition. From the first to the last it proved a great success and should be classed as one of the special drawing cards. Large crowds, both of farmers and dairymen, as well as people living in the cities, watched the process from beginning to end—the former to learn new improved methods, and the latter to find out how the good butter they have before them every day, is made.

The contest lasted four days. There were two sections, one for makers in creameries and graduates of the dairy schools, and the other for makers in any farm dairy. There were eight competitors in the former class, and seven in the latter, five of whom were ladies. This meant that seven or eight churns were in operation at the same time. The creamery men made in the forenoon, and the dairy farm makers in the afternoon.

The competitors in each class were given the same amount and the same kind of cream, ripened for churning, and each one was required to make his or her share of cream into butter made into pound prints, and wrapped in parchment paper, ready for market, and to leave the churn and appliances used ready for work again. From eight to ten pounds of butter was made by each one at a making, and as each competitor had to make up four different lots of butter, a pretty exhaustive test of his skill and workmanship was had.

In awarding the prizes, the quantity and quality of the butter was taken into account, as well as the time of the churning, cleanliness, etc. The butter was kept in cold storage, till after the contest, before being judged. H. H. Dean, professor of Dairy Husbandry, Ontario Agricultural College, and J. W. Hart, Superintendent of the Kingston Dairy School, acted as judges.

All the competitors were Canadian makers, though the contest was open to Americans. This butter making feature has undoubtedly come to stay, and another year, perhaps, better inducements may be offered to induce makers from your side of the line to compete. The following is the list of prize winners:

Section 17—Dairy School students and creamerymen—1st, Wm. Elliott, Galt; 2nd, R. Furguson, Chesley; 3rd, J. D. Malcomb, Sheffield; 4th, J. B. Anderson and D. J. McCarthy, Guelph (prize divided equally between them.)

Section 18—Makers in any farm dairy—1st, Miss Christina Stewart, Hampstead; 2nd, M. Stonehouse, Markham; 3rd, Miss Fanny Berry, Elmwood; 4th, George Rice, Currie's Crossing.

The milk test, which is always an annual occurrence at the Toronto Fair, is losing somewhat in interest, owing largely to the fact that no change has been made in the method of awarding the prizes for several years back, the results being based upon the total solids produced in forty-eight hours. The test would have greater educational value and interest, if more time were taken, and the food consumed considered in making up the results. The following tabulated statement shows the results of this year's test:

Rank.	Name of Cow.	Breed.	Owner.	Address.	Pounds of milk given in 48 hrs.	Pounds of butter fat in 48 hrs.	Total Solids in 48 hours.
1	Daisy Banks	Holstein	Rettie Bros.	Norwich	126½	3.064	13.994
2	Inka Sylvia	Holstein	C. J. Gilroy	Glen Buell	128½	3.373	13.507
3	Highland Cornelia	Holstein	Rettie Bros.	Norwich	129½	2.746	13.398
4	Queen de Kol 2nd	Holstein	G. W. Clemons	St George	120¼	2.939	12.632
5	Princess Lida	Holstein	C. M. Keeler	Greenbush	116	2.821	12.530
6	Juanita	Holstein	C. J. Gilroy	Glen Buell	111½	2.750	12.226
7	Nellie Gray	Ayrshire	N. Dyment	Clappison's Corners	114¼	2.960	12.219

The exhibit of dairy cattle all through was a grand one. The Jerseys were out in larger force than usual, some of the leading American breeders being present, including Miller & Sibley and the Hood Farm. We are sorry to state, however, that the manager for Miller & Sibley had brought his employers into disrepute by his action in manipulating the udders of some of his cows in order to gain favor in the prize ring. His action caused the loss of several valuable cows, and the exhibition association has since withheld the prize money won by the herd, and prohibited the herd from exhibiting at the industrial fair for one year. This is the first instance of this kind that has come to light at any Canadian show, and it is to be hoped that it will be the last.

The Ayrshires and Holsteins always make a good showing at this fair, and this season was no exception to the rule.

The dairy exhibit at the Western Fair, which took place at London, Ont., last week, (Sept. 16), was not as large as usual, though the quality was well up to the standard of this season. This fair is right in the center of what is the oldest dairy district in Canada, and it is somewhat surprising that the number of exhibits is falling off. The reason seems to be found in local causes, which may disappear in a year or two.

The expansion that has taken place in our export butter trade, this season so far, is really astonishing. The total shipments from Montreal, from May 1st to Sept. 15th, are valued at $3,360,000, as compared with $1,100,000 for the same period last year, showing an increase of 300 per cent. By way of comparison, it may be interesting, also, to note that for the same period the shipments from the United States were valued at $972,350, as against $467,000 for the same time last year, an increase of over 100 per cent.

Though the severe drouth in England and on the continent, may have something to do with this unprecedented export demand, yet it does not account for it all. Canadian creamery butter has undoubtedly obtained a place in Great Britian that it has never had before, and as a first-class brand is becoming a staple article in many districts. Cable reports generally continue good, though showing a little weakening for other than fancy brands.

The market on this side is somewhat quieter and prices have dropped about a cent during the past ten days. At the decline, however, more business is being done. The excitement in New York, where butter advanced 1¼ cents during the past week may have some effect here if it continues. From 20½ to 21½ cents are the quotations at Montreal, and though they are less than could have been had ten days ago, they are high enough to make the creamery butter business a very profitable one for the producer

The cheese markets last week took a decided slump, and factorymen who, ten days ago, could have got 11¾ and 12 cents for August, have now to be content with 10½ to 10¾ cents. This decline in values was not unexpected. Prices have been forced too high for summer goods, and they were bound to go back before long, though there is a shortage in the supply. The high prices caused a falling off in consumption. The situation is, however, strong, and at present values there is big money in the business for the farmer. It is to be hoped that the experience of the past week or two will teach them to accept a good offer when they get it.

J. W. WHEATON.

Toronto, Canada.

Jerseys at the Iowa State Fair.

ED. HOARD'S DAIRYMAN:—Thinking that perhaps you could use a report of the results of the Jersey show at the Iowa State fair, I append the following:

The winning exhibitors at the Iowa state fair in the Jersey classes were;

Mr. J. E. Robbins, of Greensburg, Ind; Mr. H. G. McMillan, Rock Rapids, Iowa, and Mr. J. N. Taylor, of Oskaloosa, Iowa.

The judging was done by D. W. Howie,

NO USELESS GEARS in this mill to absorb and waste power. It is a simple, direct grinder, of large capacity and requires small power. The ELECTRIC FEED MILL cuts, crushes and grinds ear corn and all small grain, converting the whole into fine or coarse meal, according to adjustment. Meets the demand for a good mill at a fair price. Circulars free. Electric Wheel Co. Box 136, Quincy, Ill.

USE LOOMIS' LATE IMPROVED "CLIPPER" DRILLER

The result of 30 years' experience in Well Drilling.
LOOMIS & NYMAN, Tiffin, Ohio.

CHERRY'S Feed and Litter CARRIER

An invention for cleaning out barns and feeding stock. The most practical device of the present day. Send for circulars to D. B. CHERRY & CO., Knoxville, Marion Co., Iowa.

LATEST IMPROVED DEHORNER (Newton's Patent.) Every Dehorner Guaranteed
THOUSANDS IN USE.
Ask your hardware dealer for them or write
H. H. BROWN MFG. CO., - - DECATUR, ILL.

IRON PIPE AND WROUGHT IRON PIPE
For Steam, Gas and Water. Good as new. Tested, Re-painted, Re-threaded and couplings furnished. Ranging in lengths to 20 feet.
ALL SIZES. WRITE FOR PRICES.
Write for Free Catalogue No. 20 of merchandise for HOME, FARM AND FIELD—from Sheriffs' and Receivers' Sales.
Roofing, Plumbing Material, Hardware, Clothing, Dry Goods, Boots and Shoes, Tools, Machinery, &c., &c., &c., AT HALF PRICE.

2nd. Robbins, on Ida's Belle.
3rd. McMillan, on Chirp's Canary.

EXHIBITORS HERD.

1st. Robbins, on Czar Coomassie, Jersey Venture, La France Pogis 3rd, Stella's Robin, Calanette's Pogis 3rd.

2nd. Robbins, on Emanon, Pearl Pensee, Etheleel Khedive 3rd, Etheleel Khedive 4th, and Ida's Belle.

3rd. McMillan, on Rufa of Chestnutwood, Transept, Chirp's Canary, Chirp's Prize and Trustee's Helen.

BREEDER'S YOUNG HERD.

1st. Robbins, on Venture's Lad, Stella's Robin, Etheleel Khedive 3d, Calanette's Pogis 3rd and Ida Belle.

2nd. McMillan, on History, Trustee's Helen, Combination Pansy, Paulina's Nana and Chirp's Canary.

3rd. Taylor, on Fashion's Signal, Nell's Flossie, Violet's Princy, Handsome Dolly, Dorca's Fanny.

GET OF SIRE.

1st. Robbin, on the get of Ida's Roiter of St. Lambert 10th.

2d. McMillan, on the get of Trustee.

3d. Taylor, on the get of Roiter's Ben Hur.

PRODUCE OF COW.

1st, Robbins on the get of Etheleel Khedive.

2nd, Taylor on the get of Callie Marie.

3d. McMillan, on the get of Transept.

SWEEPSTAKES.

Bull over two years—Robbins Czar, Coomassie.

Bull under two years—Robbins—Venture's Lad.

Cow over two years, Robbins, Jersey Venture.

Cow under two years,—Robbins, Stella's Robin.

Robbins also won the sweepstakes open to all dairy breeds. He showed Venture's Lad, Jersey Venture, Pearl Pensee, LaFrance Pogis 3rd, Catano's Grace M.

Ames, Iowa. D. W. HOWIE, JR.

Green Bone—Its Value as an Egg Food.

By green bone we mean bones fresh from the butcher, with the adhering gristle, meat, etc. Every meat shop has a great deal of this waste material, which is unfit for market, and which finds its way to some soap factory, or is thrown to the hogs. Sometimes there will be several large pieces of meat which the butcher cannot sell. These pieces add a great value to the bones.

Then on the farm there are a great number of joints and pieces of waste meat and bone which are thrown to the dogs and cats, which ought to be put to better use.

Green bones contain the natural juices as well as the adhering substances. This makes it superior to the bones that have laid on the ground for years and lost all the natural juices or animal matter. Dry bone, when fed to the hens, is insoluble, and only acts as a grit. There may be some of the mineral matter digested, but it is a very small amount. Green bone, however, having the animal matter in it, is quite soluble and easily assimilated by the digestive organs of the fowl. So it is plain that green bones are not only superior to dry bones in having the natural juices and adhering substances, but also in being more soluble and capable of having the mineral matter digested. It is well to remember that it is not what a hen eats that makes eggs and flesh, but what she is able to digest and assimilate. It is an easy matter, since the introduction of the bone cutter, to prepare green bone and meat for the hens. Green bone cannot be ground, but must be cut A good cutter can now be purchased for five dollars and upwards. Some are made for steam power, and are used on the large poultry farms. For hens it is not necessary to cut it so very fine, but for the chicks it should be cut as fine as possible.

The value of green bone lies in its well proportioned and numerous constituents, which are just what is needed by the hen to produce eggs. In it we have lime for the shell, mineral matter for the yolk, and albumen for the white. It is as near an all round food as any one food can be. There is only one objection to it, and that is it is somewhat concentrated. If hens are fed on it entirely, they will eat too much; hence it is necessary to feed it in connection with some bulky food, such as clover or bran. A good method of feeding is to give about a handful to two or three hens three times a week, but all depends upon the conditions to which the fowls are subjected. If they have a good range with plenty of grass and bugs, they will need but little, if any; but if they are confined, it is well to feed it quite liberally. Too much meat or green bone will cause bowel disease, and should be fed carefully. The green bone or beef scraps can usually be obtained at the meat shops for the mere asking, but some dealers will ask a small sum for them. The price, however, will be so small, as a rule, that they will be a great deal cheaper than wheat or corn. Not until you have tried them can you realize the value that green bone is to the poultryman. It is a fine preventive of leg weakness, which is said to be caused by a lack of mineral matter in the bones of the chick.—*Inland Poultry Journal.*

CONCERNING OUR ADVERTISERS.

The Electric Wheel Co., whose several lines of goods are familiar to our readers, are out this season with a new feed grinder. Their card appears on another page. Any who intend buying a feed grinder, will please write the Electric Wheel Company for special catalogue, and mention HOARD'S DAIRYMAN.

THE well known dehorning clipper favorably known by many cattle owners, and for the past ten years manufactured, sold and exported by H. H. Brown Mfg. Co., Decatur, Ill., is advertised in our columns. Every hardware dealer should keep them in stock. If any will not supply our readers they can get them at the above named factory on application.

VETERINARY.

Queries in this department answered by WM. HORNE, M. D. V. S., Janesville, Wis.

COW PHYSIC—Three-fourths to 1¼ pounds Epsom Salts (according to age and size of animals) and two ounces of best ground ginger. Pour over this three pints of boiling water. When at 105° F., give gradually as one dose.

CORRECTION—On page 621, third column, under answer to ophthalmia, seventh line, instead of "tincture of *arsenic*," read tincture of *arnica*, four ounces.

EATING HEMLOCK.

What effect will the eating of wild hemlock or cow bane have on cows. Have had some abort and some sick, we think from eating it. If the hemlock caused abortion, would it be safe to breed them again? Is about four weeks too soon?

Hibbetts, Ohio. B. C.

ANSWER.

Unless the cows ate a large quantity, I don't think the abortions were so caused. A liberal amount would produce nausea and sickness, no doubt, and might cause abortion, etc. It is always wrong to breed aborting cows, until they have been prepared by a proper medical treatment, and then in not less than three to four months; four is best.

LUMP JAW.

I have a cow that has lump jaw. Will you tell me through your paper what to do for her? N. L. E.

Milk Creek, Wis.

ANSWER.

Actinomycosis—lumpy jaw—is an incurable disease. All attempts at a cure is a waste of time and money, and if ever you could permanently heal up the abscess or disperse the tumor, the result would be a propagation of this terrible disease. No animal with this disease is fit to breed from. The milk and flesh from all such subjects, are dangerous as food for any kind of mammal. The only way of stamping out this and similar diseases is to kill them off and burn them, or bury very deep. I never recommend medication.

LUMP ON THROAT—SORE THROAT.

I have a cow four years old that has a lump on right side of neck next to throat; seems to be between skin and bone, and seems loose; it is about the size a goose egg. What can I do for same. My cattle have been troubled with sore throat right in between jaw bones. J. G. M.

Milford, Ohio.

ANSWER.

No. 1. Indolent tumor. It is quite safe to open this, downward, then dissect it out, sew it up, and leave a hole at the bottom. Dress with compound tincture of myrrh and aloes, liberally, by injecting with a small syringe to the very bottom. A qualified professional man is the best to do this, although the operation is by no means a difficult or dangerous one.

No. 2. Cut off the hair close and rub in Gombault's Caustic Balsam daily until you have a blister, then keep covered with hog's lard for a while.

HARD MILKING.—POLYPUS OF NOSE.

One of my cows is a hard milker, very rich and valuable, is now in full flow. I have a cow that for the last three summers has had a disorder that affects the nostrils. Her breathing is hard and causes considerable noise, nostrils sore, sometimes a little blood shows inside and there is constantly some matter. In winter it entirely disappears, at least it does not affect her to all appearances. J. O. B.

Smith's Grove, Ky.

ANSWER.

1. You require a dilating plug. Read ads in the DAIRYMAN.

2. You have here a clear case of polypus, I think. I can't doctor her by correspondence; such a condition requires and must have a personal examination by an expert. He alone can properly diagnose the case and apply the proper remedy.

WARTS.

I have a young Jersey bull that is getting quite warty. We are feeding him three quarts of oat chop, bran and cotton seed, twice a day. He is growing splendidly, is now nine months old. C. T. B.

Texas.

ANSWER.

Warts come because they come. As the wind bloweth where it listeth, so warts do come because they also list. Touch each wart with butter of antimony, two or three times a day for a while, or alternate this with nitric acid. Don't touch anything but the warts. If any of the warts are prominent, having a neck, strangulate them by tight ligature, until they drop off, then lightly touch as above.

SCROFULA.

My cow has on her right front leg, commencing at the hoof and extending up to her shoulder on the outside, something that looks like a large vein, and there are bunches on it about the size of a hazel nut, two to three inches apart, and I opened two of them and found a lot of yellow pus in them. The cow seems to be healthy, eats good, feeds good, gives a good flow of milk; came in six weeks ago. A SUBSCRIBER.

Baraboo, Wis.

ANSWER.

If there is no known accident as a cause, then the cow is of a scrofulous diathesis. If accident, and the tumors are ready, open them largely, and dress with compound tincture of myrrh and aloes; inject liberally and to the bottom of each tumor.

If scrofula, I would not breed from her, as thus the disease is propagated. A serious thing, and to be avoided as much as possible.

Horse Owners! Use GOMBAULT'S Caustic Balsam

A Safe Speedy and Positive Cure

The Safest, Best BLISTER ever used. Takes the place of all liniments for mild or severe action. Removes Bunches or Blemishes from **Horses and Cattle. SUPERSEDES ALL CAUTERY OR FIRING.** *Impossible to produce scar or blemish.*

Premium on Milk.

Patron Gains Thirty-one Per Cent Profit from Babcock Test.

There are two creameries near here which are frequently compared and contrasted. Both are good creameries, and both sell their butter at a premium above the highest quotations. Both paid sixty-five cents per hundred for average May milk.

One of these creameries pays by the test and the other by the hundred. That is, in one milk is tested and the money divided according to the amount of butterfat contained. In the other all milk is paid for alike regardless of richness.

One has a large patronage and the other only a medium patronage. The one with large patronage ought to manufacture more economically than the one with a much smaller quantity of milk, and unquestionably it does. How, then, could the smaller creamery pay the same average price per hundred as the large one? Undoubtedly the test helps out in this. There is no inducement to keep skim milk cows if the milk is tested. The milk at both creameries is good, but where the milk is tested the natural tendency is toward richer milk. One farmer who was a patron of the creamery paying by weight changed farms and delivers his milk to the other paying by test, and he received eighty-five cents per hundred. Had he remained he would have received but sixty-five cents and the other twenty cents belonging to him would have been paid to some fellow with thin milk. Now eighty-five cents is just about thirty-one per cent more than sixty-five cents. As a matter of fact, he received thirty-one per cent more than the average at his own creamery. He was paid a trifle more for ten pounds of his milk than thirteen pounds of average milk brought. His herd is a full blood Jersey herd and the steer calves are no good except for veal. If he wants a steer calf he buys it, and cheaper than he can raise it, taking into consideration the diminished milk value from steer calf cows. There is another side to this. Where milk is not tested, and the cows are crammed with feed the year round and replaced with fresh cows as fast as they are broken down for milk, a big milk and butter fat yield per cow can be secured by careful selection of the cows. But the average cow with average care and the milk hauled to the average creamery gives only average results, and there is nothing to be proud of in average results. The good farmer always beats the average.—*Waverly Republican*, Iowa.

Water Logged Butter.

The Minnesota Dairy Commissioner has seized about forty tubs of the so-called new process butter.

The process does increase the weight, but not of butter. The chemist has found after baffling attempts, what makes it. The increased weight is mostly water. The normal proportion of water in butter is twelve to fifteen per cent. Specimens of this process butter run as high as forty-five to fifty-five per cent in water. The man who buys it is paying for half water.

The chemical that has such an affinity for water is said to be chromate of lead, a substance that is considered far from wholesome. If a man got enough of it to say so it would be poisonous.

The process purports not only to increase the weight but to preserve the butter. It does. The specimens are found to contain boracic acid, which is a perfect preservative, killing all the microbes, even to those that help digestion in a fellow's insides. It isn't good for a man to have his insides embalmed while he is still alive.

The New York dairymen are struggling with some of the same product and have not been able so far to account for the mischief. Of the forty tubs seized in Minnesota, something like twenty are supposed to come from North Dakota. One consignment was stopped in Minneapolis and the commission man, to avoid prosecution, returned it all. Now some of the same butter has turned up in St. Paul. This time it will be destroyed.

The department will try to stop that business entirely. The butter makers, not knowing the nature of the transaction, are hardly to be blamed for being tempted. The Chicago compounders offer for $5 "the secret," and so much for the powder, to increase the yield of butter half as much again and improve the quality. What guileless dairyman would not gladly seize such an opportunity?

MRS. ANDERSON'S BABY.

You couldn't convince Mrs. Anderson that Cupid ever was as pretty as her little girl.

Mrs. H. C. Anderson is well known in South Britain, Conn., where she lives. She is very enthusiastic about Dr. Pierce's Favorite Prescription although no more so than thousands of other women who have been similarly benefited. She writes:

"During the first month of the period of gestation I could not keep anything on my stomach. I went to bed the 28th of June and never got up till the first of August. I tried different doctors, but with little benefit. I began to take your 'Favorite Prescription' in November and I had a nice little baby girl in February following. I was only in hard labor about one hour and was up and dressed on the eighth day. I never had the doctor with me at all; just the nurse and two friends. This makes my second child; with the first one I did not take the 'Favorite Prescription,' and the little one was sick all the time and lived just about two months. This last baby is as plump and healthy as any mother could wish. She is about three weeks old now and is gaining in flesh every day."

Mothers who suffer undue pain prior to or succeeding the baby's birth are invited to consult Dr. R. V. Pierce, by letter, absolutely without charge. The great success which has attended the careful methods pursued by Dr. Pierce, has caused imitators to spring up, who make offers of free advice, which they are not competent to give, not being physicians. When you are invited to "write to a woman," ask the simple question, "Is this woman a physician?" You will find that she is not, and does not, and dares not claim to be, a physician. To offer such advice is deceitful. To receive it is dangerous.

Prospective mothers should send for a free copy of Dr. Pierce's great 1,000 page book the "Common Sense Medical Adviser." A copy in paper-covers will be sent to any address on receipt of 21 one-cent stamps to pay cost of mailing *only;* in cloth-binding 31 stamps. Address Dr. R. V. Pierce, Buffalo, N. Y.

Water in the Stable a Necessity.

It is now regarded as a necessity that stock in the stable should have constant access to water of suitable temperature. The dairyman who today turns out his cows to drink, is as far behind the age as the farmer who cuts his grass with a scythe, or rakes it up with a hand rake. are more complete than ever before. They will be furnished, if desired, with Patent Automatic Self-Feed, **increasing capacity greatly and diminishing labor of feeding nearly ONE HALF. Four sizes, Nos. 16, 18, 20 and 26.**

Patented 1899.

If your dealer don t handle them. write for 99 Catalogue and get **SPECIAL Introduction PRICES on the SMALLEY LINE COMPLETE.**

"YANKEE SILO SENSE" —our latest Silo booklet, ex-Gov Hoard s Latest Views—mailed free to any one naming this paper

SMALLEY MFG. COMPANY, Sole Makers, MANITOWOC, WIS.

MAKE ONLY SWEET ENSILAGE

Ever since the ensilage system has been introduced in this country it has been the ambition and effort of siloists to ***produce sweet ensilage.*** The making of sweet ensilage depends principally upon two things—***1st.*** the use of a well matured crop and ***2nd.*** upon low fermentation. Granting the maturity of the crop, shredded ensilage makes the sweetest ensilage. The reasons are, that shredded material is of a nature that makes it pack much more closely in the silo. That means exclusion of air; there can be no extreme fermentation and consequent development of acid without the free action of the air. ***Shredded ensilage possesses other advantages in addition to its sweetness:—*** it is eaten with great avidity by animals, being a long, soft substance and free from any sharp angles and corners to cut or lacerate the mouth and gums; it is therefore fed with less waste.

The best way to Shred Ensilage is with the

St. Albans Ensilage and Fodder Shredder.

It is the Original Shredding Machine and all other so-called shredders are merely imitations of this one. ***It will certainly pay you*** to look into the merits of this proposition and machine before buying. We mail free a pamphlet on the subject.

ST. ALBANS FOUNDRY CO., ST. ALBANS, VT.

SAVE THE WHOLE CORN CROP

A corn crop may be profitable without saving the fodder, but **it will be twice as profitable if it is saved.** The new method of handling corn saves the entire crop. The new way is to run all the corn through our

JANNEY COMMON SENSE Corn Husker and Fodder Shredder

There can be on dreaded "corn stalk disease" where fodder is prepared with our machine. You can make a great deal of money husking for neighbors. Costs less than a third as much as a thresher, but makes more money.

Write for Free Catalogue.

It husks out all of the corn clean, and shreds all the fodder at the same time. Makes clean, healthful food, as the patented screen in the feed elevator takes out all the **dust, dirt, smut.** etc.

Go to your nearest dealer and see one.

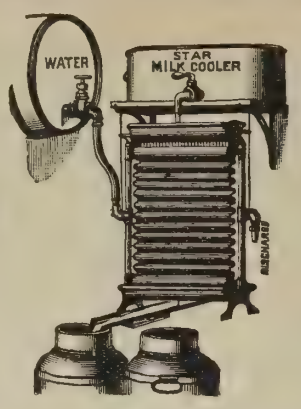
A Perfect Milk Wagon



On a Perfect . . . Short Turning Gear

WE make the only drop center wagon that has a self-balancing, short turning gear. All parts are wrought iron forgings. It is so plain and simple that it can't get out of order and if any part should break, any country blacksmith can easily repair it. All other wagons of this kind have complicated gears, and mostly made of cast iron.

Write us for our Catalogue, which fully illustrates and describes this wagon and 10 other styles.

THE O. ARMLEDER CO., Cincinnati, Ohio.

Star Milk Aerator AND COOLER.

If you have milk worth cooling at all, it is certainly worth while to cool it thoroughly. An efficient Milk Cooler will cool to within two degrees of temperature of water used; the Star does this and also **AERATES.**

If you would like to know the reason why, send for 1899 Catalogue of Sanitary Dairy Apparatus.

To be had for the asking.

STAR MILK COOLER CO., Haddonfield, N. J.

Is it **CHANCE,** is it **GOOD LUCK,** or is it **MERIT** that has enabled the patrons of

GENESEE SALT

for five years in succession to win the SWEEPSTAKES PREMIUM of the NATIONAL CREAMERY BUTTERMAKERS ASSOCIATION? Certainly they were good buttermakers, but perhaps the Salt had some little to do with the result. The winners were as follows:

In 1895.....F. G. OLTROGGE
In 1896.....THOS. MILTON
In 1897..... H. N. MILLER
In 1898.....S. HAUGDAHL
In 1899.....R. T. MCCOLL

Study your own interests, use **GENESEE SALT,** and write to our General Western Salesman, Mr. F. A. TRIPP. 34 Clark Street, Chicago. Or address

Yours truly,

THE GENESEE SALT COMPANY, New York.

YOU CAN PREVENT BLACKLEG

among your cattle by the use of Parke, Davis & Co.'s **BLACKLEG VACCINE.** Every lot is tested on cattle and found reliable before a single dose is put on the market. It will prevent **BLACKLEG** if fresh product is used, the same as vaccination prevents Smallpox in the human family. Operation simple, and easy to perform. Specify P. D. & Co.'s, and get the kind that is always reliable. For sale by all druggists. Write us for literature and full information, free on request.

THE NEW BOOK Feeds and Feeding

By Prof. W. A. HENRY,

Wisconsin Experiment Station.

This book should be in the hands of every stock feeder in the country. Every reader of HOARD'S DAIRYMAN ought to have it. It is a large, well bound book, nicely printed, over six hundred and fifty pages. Price $2.00

Four Yearly Subscribers at $1.00 Each ($4) Will Secure It as a Premium.

Four Yearly Subscribers at $1.00 Each ($4) Will Secure It as a Premium.

Of This Book Hon. JAMES WILSON, Secretary of Agriculture, Washington, writes as follows:

"Prof. W. A. Henry, Dean of the Agricultural Department of the University of Wisconsin, has recently given to the American student and the American farmer a work on feeds and feeding. Singularly enough, up to this time we have had nothing along this line sufficiently comprehensive from both the scientific and practical standpoints. We have had very able works from both, but Prof. Henry is the first to combine science with practice, and give us a work that will be of value alike to the instructor in the Agricultural College, to the student who is seeking the principles underlying feeding, and to the practical farmer who feeds.

This publication will take its place immediately in the college library, and ultimately in the private library of every farmer in the land. When the instructor, student or practical farmer inquires where there is a work thoroughly exhaustive of this subject, he can now be referred to Prof. Henry's book.

Sent as above, or will be forwarded, carriage paid, on receipt of price, $2.00.

From Butter Maker To Producer.

We believe it to be the fact that every butter maker who intends to continue in the creamery business is looking forward to the time when the factory he operates will be his own property. This is a commendable ambition, and we propose making it possible for every live, energetic butter maker who reads this to realize his hopes in a very easy manner. Wouldn't you like to own a flourishing little factory, thoroughly up-to-date in every particular, and doing a nice, profitable business right from the start? We think you would, and if you have the right sort of material in you we will back you up in a plan which will enable you to secure such a factory with practically no investment at all on your part. We want to see the butter makers do well; we want to see them make more money, and we know the plan we have in mind will bring this about in less time than any other legitimate proposition which will be submitted to them. Being manufacturers we can offer exceptional inducements to our customers as well as to those about to engage in the creamery business. We want to hear from you and to make you prices on our line of

The Tubular -- East and West

As an evidenee of what a perfect separator will do under widely varying natural conditions, we publish here two letters from users who are at opposite ends of the country. The reader will observe that there was but a few days difference between the dates of these reports, but there was a wide difference in conditions. In one instance the most vigorous of winter conditions pertained, while in the other case February was practically summer. Notwithstanding these wide differences, the results were in each case practically the same. Could there be any better evidence of the superiority of the Tubular Separator than these voluntary endorsements? These are but a few of the many cases of a similar kind where the variations in conditions are greater even than these.

ENON VALLEY, Pa., Feb. 17, 1899.
Dear Sir: Am well satisfied with the Tubular Machine, she runs steadily and smoothly. I think she is very well constructed. We receive at the present time 3500 lbs. of milk daily, run it through the Tubular machine in ninety (90) minutes, use forty-five (45) lbs. of steam, revolutions 23,000. Skim milk test from new milk, .002; milk 12 hours old, .004: cream test from 30 to 35 per cent; cream in good condition. If you wish my opinion any time later on, I will be glad to answer any questions.
Yours truly,
CHRISTIAN RUCHTI.

NICARIO, CAL., Feb. 5, 1899,
Dear Sir: Everything is running nicely now, Tubular is doing daisy work. I have been skimming right along at .025 to .03 since you left. Revolutions 22,000, temp. 78 degrees Fahr., capacity 2800 to 3,000 lbs per hour. If any one wants a recommendation of the Tubular I am with you. I like it better every day. It takes me just ten minutes to clean it up, and it is done nicely too.
Yours truly,
A. J. COMPTON.

Sharples Tubular Separators earn such encomiums of praise wherever they are in use. In addition to its large capacity, ability as a close skimmer, being easy to clean, etc., remember that—It is a safe machine—absolutely "burst proof." It has large actual and reserve capacity. It is economical in power, oil and repairs. It makes the smoothest and most churnable cream. It increases the yield of butter and makes better butter. It is built on honor and sold on its merits. Read, meditate, and then

DISBROW

The Original Combined Churn and Butter Worker.

Churns and works the butter on the only true principle. Brings the butter to the working rollers no faster than the rollers can take care of it without rubbing the butter. No solid BALL of butter comes in contact with the rolls to be scraped to pieces by the rolls and made salvy. It is the only combined machine in which butter has been made that scored 100 points.

The manufacturers have never made any claims for it that were not fully proven by actual tests of the machine.

The Disbrow tells its own story and a fair trial is all that is needed to prove its merits.

OWATONNA MFG. CO.,

SOLE MANUFACTURERS. *OWATONNA, MINN.*

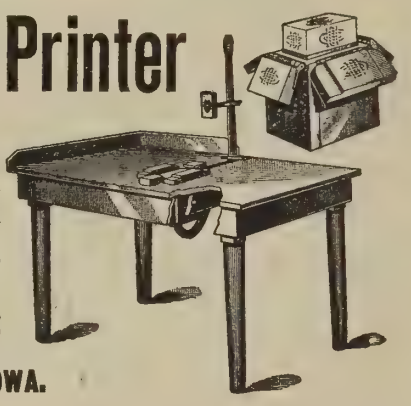
Dairymen, when Visiting the State Fairs,

BE SURE AND LOOK UP OUR EXHIBIT.

There you will find our representatives who will be pleased to show you

The Improved U. S. Separator

and explain its many points of excellence. Be sure and investigate its merits before purchasing any other make. It is fast being recognized as the best for every day use.



The U. S. the Queen of Separators.

MIDDLEBURGH, N. Y., August 10, 1899.
About a year ago I desired to purchase a separator, and naturally I examined very thoroughly the different ones advertised. Becoming convinced that the Improved U. S. was the best, I accordingly purchased one, and a full trial for over a year has proven the wisdom of my choice. It is the most perfect in construction, skims perfectly clean, runs so easily that a child can operate it, and, in fact, is the acme of perfection. It is the queen of separators, and it affords me great pleasure to forward this unsolicited testimonial.
J. E. YOUNG.

A COUPLE OF WISCONSIN JERSEYS.

The illustrations on this page are of a Jersey bull and cow owned at Footville, Wisconsin, and whether regard be had to their form or their breeding, they are worthy to stand in any company.

Toltec's Signal would not score very high by any "official" scale of points. He does not have a level back, a masculine head or well developed thighs, but is in fact a "cowy" bull in every aspect, and it is no surprise to us to read that he already has five daughters with records above fifteen pounds of butter in seven days—one with first calf reaching fifteen pounds, three and one-half ounces, and one with second calf, eighteen pounds, four ounces. He gets this form and potency from his sire Toltec, a son of the great Tormentor and the greater Oonan, and his dam, Signalda's Rosebud, a grand-daughter of the imperial Signal. He is a good illustration of the maxim that blood will tell.

The cow is a Wisconsin product, bred by Gen. George E. Bryant, of Madison, one of the earliest Jersey breeders in this state. She has a record of 17 lbs., 8 oz., and two daughters in the 14-lb. list. Through her sire she traces to Gold Basis, Gilderoy, and old Noble, names that appear very frequently in the pedigrees of famous cows; her dam was the daughter of Omaha, a half-brother of Oonan, and a bull that for the advantages offered him ranks second to no Jersey sire in America. Nobody could make the mistake of judging her to be other than a great cow. In the hands of some breeder who would dare to feed her to the limit of her great capacity there is no question but what she could exceed twenty pounds in seven days, and this comes very near reaching the limit.

New York Farm and Dairy Notes.

Observations at the Fairs.

ED. HOARD'S DAIRYMAN:—I have attended several fairs in my vicinity, and some notes taken on the live stock and dairy implements may have some interest for your readers. If I may be allowed to first digress from strictly dairy matters, I wish to tell something about the attractions at some of the fairs which I have attended. I have attended only one fair which was strictly an agricultural fair. The others were run on the "circus plan," i. e., attractions were provided to draw the crows which had but little interest in agricultural matters.

It is a fact that the fairs where the vulgar side-show, the fakir, and the gambler, were a part of the attractions, drew the largest crowds, and I suppose from a financial standpoint were the greatest successes. When attending these fairs, I cannot help but feel that there are other considerations than the financial, i. e., the educational and moral value which they have for the people. How often have I seen the hired man who works hard on the farm for fifteen or twenty dollars a month spend a month's wages in one day at the fairs. He was tempted to try his skill in some game of chance with a gambler or sharper, with the result that he lost his money.

Besides the professional gamblers, there are many other catch-penny affairs on most fair grounds. It certainly does not encourage economy and habits of saving, to tempt the farmer's boy to throw away the hard-earned money in this way. Of course we want our young people to have a good time and to enjoy a holiday which will give them pleasant recreation and a change from the monotony of farm work, but there is a better way to have a good time than to patronize the gamblers, and the often obscene side shows. In many of these shows the indecency which is witnessed is demoralizing in its influence.

An attraction at one of the fairs this year consisted in erecting a platform thirty feet high over a large tank of water. Horses and other animals were taken to the top of the platform, and forced to jump down into the water. Some of the poor creatures were trembling with fear when they were shoved off the platform into the water, and yet this drew a large crowd all the time and the performers were paid by the fair managers for this performance, and it was widely advertised by them as the great attraction of the fair. Such performances are not congenial to the feeling of cultured, refined and sympathetic people, and they do not draw the class which we desire to see at the fairs.

To say that the fair managers are responsible for the demoralizing influences of these kind of attractions, in that they have deliberately planned them, fully realizing all the evil which may follow, I think is preferring too grave a charge against them. More often, I think, it is because they have not given the matter due consideration, and they have to solve the problem of making the fair a financial success. I think it is a fact, and I know it is true in my locality, that the fairs which have sought for, and sold privileges to these questionable attractions, have not in the end been successful.

I have in mind one fair which for two or three years was run on the "circus plan" which has been discontinued for lack of support. The best people became so disgusted with it that they withdrew their patronage. Another fair which has acquired the reputation of being a "clean fair," and which has become noted for its fine cattle, and the excellency of its exhibits, has the patronage of the best people in its vicinity, and it has been maintained for many years, and there has never been a trouble in regard to its finances.

I think it is the better way for the managers of fairs to cut down the expenses, and the premiums if necessary, until they can be supported, if conducted as purely agricultural fairs, whose purpose it is to educate people along agricultural lines. Let amusements and recreations which have no demoralizing influence be provided. The fairs should be a school for our people, and the amusements should be good music, addresses, athletic exercises, and games, etc. Let the best people in the country demand this, and then we shall get what the fair managers believe the people want.

NOTES ON DAIRY CATTLE.

I have only a little space left for my notes on the types of dairy cows which I saw at the fairs. As most of my readers know, a good place to see the best types of well-bred Jerseys, Guernseys, Ayrshires, Devons, Holsteins, etc., is at a Delaware Co. fair. One Jersey cow was so perfect a type of the breed that I was led to ask the owner some questions. He told me that she was ten years old, and that she had not been dry for eight years. When fresh in milk, with only ordinary feed and care, she easily makes two and one-half pounds of butter per day. This cow was perfectly marked, having the dairy form, the notched backbone, the very large and crooked milk veins, the yellow ears, and long, slim tail. That the owner valued this cow for breeding purposes was evident, for beside her were three or four generations of her progeny, all nearly as perfect as the mother, and all having a milk record nearly equal to hers.

In another stall was a cow of a different type from the little Jersey. This was a Holstein cow which was giving 120 pounds of milk per day. She was a very large cow, probably weighing twice as much as the Jersey mentioned. I presume the milk from this Holstein contained no more butter fat than did the quantity of milk which the Jersey was giving, but she required twice as much food to keep her. Each of these cows was adapted to a special purpose, one the milk seller and cheese maker, and one to the butter maker. Passing along we come to the Ayrshire, the cow which is adapted to picking her living on the rough hillside pasture, where the large Holstein could hardly live, and few breeds have more good qualities. We saw some very fine types of this very handsome breed, the Devons, and I think this one of the reasons why they are still retained in the dairy herd. We also find the Herefords, Galloways, and other noted breeds well represented. W. J.

Coming Events.

Georgia Dairymen's Association, Grantville, Ga., Oct. 12, 13, 1899.

Pennsylvania Dairy Union, December 5-6, 1899, West Chester, Pa.

New York State Dairymen's Association, Cortland, N. Y., Dec. 13-15, 1899.

THE GEORGIA DAIRY MEETING.

The Georgia Dairymen's Association is among the youngest of similar organizations in the country, but it is taking hold of the work of dairy education in that state in a vigorous and commendable manner. The coming sixth annual meeting of the Association will be held at Grantville, October 12th and 13th, at which prizes, to the amount of $500, will be offered for the best exhibits of dairy cattle and their products. A very interesting program has also been prepared. The editor of the DAIRYMAN acknowledges the receipt of an invitation to attend the meeting, but engagements in another direction will prevent our acceptance. We are certain, however, that the Georgia dairymen will have a meeting that will prove of great value to their state in the future of its growing dairy interest.

"MINARETS."

Our good friend, Col. Hardin, of Kentucky, makes himself merry in illustrating the old adage that "where ignorance is bliss 'tis folly to be wise"; writing in the *Jersey Bulletin* about the pictures of cows, he refers to a cut of four cows from the herd of Mr. C. A. Sweet, of Buffalo—and we may say in passing, the fact that a cow is in that herd is something more than *prima facie* evidence that she is an excellent cow—and says: "One striking feature of those superb cows condemns them utterly; there are no "minarets" in sight. The pelvic arch "contingent would send all four of them, bag and baggage, to the butcher and turn their butter-saturated carcasses into oleomargarine."

This may be fine writing and well suited to the place where it appears, but it is simply sheer nonesense. A "butter saturated carcass" goes several steps beyond the practice said to be not wholly unknown of injecting cream or pure butter fat into a cow's udder in order to increase her apparent yield, and we are fully persuaded that saturation is unknown in Mr. Sweet's herd.

But quite apart from the colonel's loose writing, we have to say that the "minarets," he so loftily condemns, are very apparent in the picture to which he alludes, and most prominent on the cows with the largest records.

Evidently Col. Hardin would not know a pelvic arch if he saw it.

BAD JUDGING OF JERSEYS IN ENGLAND.

It is evident that the leaven of better and more legitimate ideas of the form of a dairy cow, is working in England as well as the United States. In the London *Live Stock Journal* of July 21st, a correspondent over the signature of "Veritas," complains bitterly of the lack of judgment and dairy like comprehension, which characterized the judging of Jersey bulls at the Royal Show. Particularly does this correspondent comment on the un-Jersey like idea of a "level back," which seems to have corrupted the ideas of the judges. On this point he says:

"Judges have exhibited a want of knowledge of what points a Jersey bull should possess. They appear to have been influenced almost entirely by a "level back," wholly ignoring all the leading points that go to make a Jersey bull which one would wish to breed from. Such important points as "touch," "fineness of bone," "absence of throatiness," "a fine shoulder," "a deep barrel," etc., have been ignored, with the result that coarse, throaty, thick-shouldered, but level-backed, animals have carried away the principal honors."

This "level-back" idea was never a point in dairy conformation. It has crept into the scale of points of all the dairy breeds and is a survival of the old Short-horn type of an animal. Probably the men who placed it in the scale did so because they did not know what else to say about the top line of a dairy animal. Whereas, if they had been close students of the best specimens of their respective breeds, such cows as have given fame and reputation through their performance, they would have seen that not one grand cow in a hundred has a "level back," or a "straight back from the head to the setting on of the tail."

Plain, substantial, common sense, and close, practical observation have not been allowed to have their way in the making of these scales of points for the various dairy breeds.

There ought to be a speedy reformation in this respect and an overhauling of these scales, in order that judgment may be based on the conformation that is the outgrowth of dairy functions, not flesh making.

Not one good judge of a dairy cow in a thousand would dare to buy a cow, with his own money, as a dairy performer, on the lines of judgment laid down in these respective breed scales. When it comes to the judging of bulls the case is still worse. Artificial and unreal notions of what the bull is for, the object of his existence, are allowed to have sway. As we said before, this all comes from the Short-horn, or "general-purpose" ideas, which for so many years governed the ideas of men in regard to dairy cattle.

A CHEESEMAKER'S TESTIMONY.

There so is much skepticism among the average patrons of cheese factories and creameries relative to the practical value to them of a paper like HOARD'S DAIRYMAN, that we are tempted hundreds of times to print some of the strong testimony we receive on that question. We know from a very wide experience that it cannot help but pay any man who keeps cows with a hope of profit, to be a reader of sound dairy literature. We have never seen an instance among thousands, when it did not pay. But cheese factory patrons in particular are hard to interest in their own improvement. As one man said to a neighbor not a great while ago: "I don't see what you want to take HOARD'S DAIRYMAN for, and besides you buy books. Don't you know enough to keep cows and make milk? I don't need anything of that kind to run my dairy with." His neighbor took a good way to answer him. He said: "See here, you have thirty cows. How much milk did you take to the cheese factory this morning?

The first man hung his head a little and finally said, "I believe it was three hundred pounds."

"Well," replied the second man, "I have twenty cows and they have been milked most of them six months, and my receipts this morning were four hundred pounds. Your thirty cows gave ten pounds a piece and my twenty cows gave twenty pounds a piece. That difference of ten pounds per cow I got by reading HOARD'S DAIRYMAN and good books on dairy farming. I get one hundred pounds more milk than you do with ten less cows, and yet you cannot see why I take and read a paper like the DAIRYMAN."

The other day Mr. De Lap, who runs an excellent cheese factory at Medford, Wis., wrote us to say that he would be very glad to help spread the circulation of the DAIRYMAN as it had benefited a number of his patrons very much. As he expresses it; "Now I can talk with these men interestingly on dairy subjects for they are posted, and today one of them told me he was going to buy bran and oil meal for his cows."

It is worth just as much to me as it is to him. Long live HOARD'S DAIRYMAN."

There is the point. A larger understanding of dairy subjects helps both the patron and the factory man. When cheese factory patrons come to understand where the most money lies in their end of the business, they will see that it pays to read a good dairy paper.

A NEW SCHEME FOR CHECKING OLEOMARGARINE.

The Chicago papers report that the Illinois Dairy Union is considering the plan of having retailers put a descriptive and duly copyrighted label on all packages of genuine butter sold by them. No particular brand or grade of butter is to be advertised, the only requirement being that it shall be genuine butter. Poor butter advertises itself, and the label will simply guarantee purity. Of course, no dealer will dare to put such a label on oleomargarine or any other kind of counterfeit butter and the absence of the label will therefore be presumptive evidence that the article is spurious.

It is proposed to have wholesalers and commission men furnish these labels to their customers. The expense will be trifling, probably not more than twenty cents per thousand. It is also proposed to have the labels and their uses freely advertised.

Such a scheme would seem to be not unworthy of trial, but we predict that the oleomargarine promoters would very soon put out something which will be so nearly like these butter labels that only a close examination would detect the difference. The sale of oleomargarine in any considerable amount is possible only by resorting to deception and fraud, and when any set of men commence to cheat and lie they are very apt to keep at it, until they find themselves face to face with prison doors.

A Tasmania Letter and Feeding Inquiry.

ED. HOARD'S DAIRYMAN:—We thank you for your reply to our favor of May 8th, last, and regret the bull was not available, but the distance, we fear, will prevent us dealing in your territory.

One of our clients asks us to obtain, through your valuable paper, a balanced ration from the following products: Greenstuffs at 10s per ton; pea meal at 3s., 3d. per bushel of 60 pounds; pollard at 3£., 15s. per ton; sharps at 4£ per ton; oaten hay at 2£. per ton; cocoanut oil cake at 8s. per cwt.; molasses at 3s., 6d. per cwt.; root crops at 15s. per ton. These with butter bringing in the local market 1s., 2d. per pound.

We may say your paper is read in this far distant (from you) colony with great relish. I give my paper to a Mr. Page, of Ranelagh, who is a keen dairyman, and from him it goes round his district. This will, no doubt, hardly please you from a financial standpoint, but it shows how a good thing is appreciated. Wishing you every success.

Tasmania. MURDOCK BROS.

For the benefit of home readers we may mention that in Tasmania as in England, the hundred weight is 112 pounds, and the ton 2,240 pounds; and that pollard and sharps are other names, respectively, for bran and middlings. It is usual, also, to reckon the pound sterling as equivalent to five dollars in United States currency, although its exact interchangeable equivalent is only $4.87.

Replying to the inquiry, we have to say that without more definite information as to the character of the "green stuff," we cannot submit a complete formula any more than we can when pasturage is relied upon to furnish a part of the daily allowance. In this country the pea meal would be considered the cheapest of the feeds named, but as that is specially deficient in ether extract, (fat) the cocoanut meal, which is rich in fat, although costing nearly $40 per ton, comes in as an excellent supplement. There is not much to choose between the pollard and sharps, so far as value is concerned, but the pea meal and the cocoanut meal are very concentrated feeds, and therefore our choice falls upon the pollard to go with them.

Assuming, therefore, that the "green stuff" is not expected to form the greater part of the ration, we suggest for trial the following daily allowance as an average for each animal in the herd, where it is to be expected that some cows will require more than this, and others less:

FORMULA FOR RATION.	*Dry Matter.*	*Digestible Nutrients*		
		Protein.	Carbohydrates	Ether Extract
15 lbs. oat hay.....	13.66	.65	6.96	.23
3 lbs. pea meal.....	2.69	.50	1.55	.02
4 lbs. pollard.....	3.52	.50	1.54	.12
2 lbs. cocoanut meal	1.79	.31	.77	.21
Totals.....	21.66	1.96	10.82	.58

There should be added to the above enough material from some source to bring the digestible protein to not less than two and one fourth pounds, and it is quite probable the green stuff and the roots will supply this deficiency.

We have had no experience in this country in feeding molasses to dairy cattle. It might be practicable to add one pound to two pounds to the grain for cows, but if done at all, it should be only in a tentative and limited way at first. Neither molasses nor the cocoanut meal should be fed to bulls kept for service.

We beg to add, partly by the way of justification, in the event that the foregoing suggestions should not prove suited to the conditions existing in far off Tasmania, where they may be so unlike those existing here, that we do not believe in, or advocate feeding by set rules, and in unvarying amounts and combinations. Rather than this, our constant advice is to have the feeder govern himself by the results.

In the present state of knowledge on the subject, the most important matter seems to be to supply the cow with digestible protein We place the minimum at two pounds, and this should be increased, somewhat, in proportion to the ability of the cow to responc in milk. With some cows three pounds would not be too much. After making sure that the cow is receiving sufficient protein, her own appetite is the best measure of the amount of feed required. Give all she will eat, and encourage her to eat as much as

possible. To this end, as well as to aid digestion, let her have a daily allowance of salt—a large tablespoonful is none too much.

We thank the Messrs. Murdock for the kindly mention they make of our efforts to serve our fellow dairymen. Money returns for our labor are by no means undesirable, but these, unaccompanied with assurance that we were returning full value, would not be quite satisfactory. It is far more pleasing to us to know that a single paper is read by a half dozen persons, than it would be to know that a half dozen papers could not find a single reader.

Our Special Elgin Letter.

ED. HOARD'S DAIRYMAN:—No butter was offered for sale on Monday's Board of Trade although a bid of 23 cents was made on any lots that might be placed. The quotation committee announced the market firm at 22½ cents.

The sales for the corresponding week of the three preceding years, were as follows:

Sept. 26, '98, 17,100 pounds of butter sold at 20c.
Sept. 27, '97, 5,220 pounds of butter sold at 22c.
Sept. 28, '96, 63,960 pounds of butter sold at 15½c.

The New York market was reported firm at 23 cents. H. C. B.

Elgin, Ill., Sept. 25.

INQUIRIES AND ANSWERS.

Every inquiry must be signed with the name, Post-office and state of writer. Condense the questions into plain specific inquiry. Be careful to note if your questions have not been answered in replies to others. We are glad to answer all the pertinent questions that we can concerning machinery. Look over our advertising columns and write to the advertisers.

FEEDING STANDARDS FOR MILCH COWS.

Dry matter.	DIGESTIBLE NUTRIENTS		
	Protein.	Carbohydrates.	Ether extract.
lbs.	lbs.	lbs.	lbs.
23 to 28	2.0 to 2.5	12 to 15.0	0.5 to 0.8

QUAKER DAIRY FOOD.

Concerning this article an Illinois "Cow Feeder" writes:

Quaker dairy food is a feed made at Cedar Rapids, Iowa, and, perhaps elsewhere, by the American Cereal Co. I would like to see its analysis in your paper. It looks to me like oat hulls, oat clippings and such like refuse, and yet it sells at $12 per ton. It is claimed to be pure oats and some wheat, and of course the "best feed going."

The analysis will come from some of our Experiment Stations in due time. While waiting for that, the facts obtained by dairymen who have fed it will be as welcome as timely.

A FLORIDA RATION.

Kindly give me the best ration out of the following feeds for Jersey cows, ranging in weight from six hundred to one thousand pounds, viz.: Shipped timothy hay, $20 per ton; native crab grass hay, $10; rice bran, $10; wheat bran, $20; cotton seed meal, $20. Would it help the flow of milk any to add to the above ground corn and cob meal? Price of corn, fifty cents per bushel.

Gainesville, Fla. S. L. C.

We should feed neither timothy nor wheat bran at the prices named, but mix rice bran with cotton seed meal, in the proportion of four parts of the former to one part of the latter, both by weight, and feed from six to twelve pounds of this mixture daily and all the native crab grass hay each cow will eat.

FEEDING VALUE OF HUNGARIAN HAY.

What is the value of well cured Hungarian hay, as feed for milch cows? Also what amount would be safe to feed one cow of 1,200 pounds. J. W. H.

Fairfax, Iowa.

We have an impression that a question similar to this was answered not long ago, by saying that Hungarian (or millet) hay ranked about midway in feeding value between clover and timothy hays. The figures for the digestible nutrients in these feed stuffs are as follows:

	Clover hay.	Timothy hay.	Hungarian hay.
Protein	6.8	2.8	4.5
Carbohydrates	35.8	43.4	51.7
Ether extract (fat)	1.7	1.4	1.3

If Hungarian grass is cut early, before the seed forms, and well cured, it makes excellent hay and may be fed *ad libitum*. But if it is allowed to stand until the seed has become even partially matured, much of the virtue of the stalk has gone into the grain, and the latter is so small and hard that neither cow nor horse can masticate it. The result is that not only is a very considerable portion of the nutrients undigested, but the unbroken seeds are liable to lead to irritation and inflammation in the digestive tract. It is claimed also that Hungarian hay when considerably ripened, has a deleterious effect upon the kidneys.

It follows, therefore, that the amount that can be safely fed to a cow will depend upon circumstances.

SILAGE FROM DRY CORN.

Will corn that has been shocked up and well cured make good silage? If so, does it want putting in the same as green corn? I have heard that it wants wetting in the silo; if this is so, how much water should be used? J. H. L.

New York.

A somewhat similar inquiry was answered last week, in a way tending to discourage such practices. We have it from good authority, that a fair quality of silage can be had from well cured corn, but we fail to see any particular gain in so doing.

If the corn is now well cured, we would hold it in this condition and run it through a shredder, or else cut it up pretty fine, dampen sufficiently and leave it in a pile to heat up and soften. It will keep in this condition for several days in winter, and makes a very palatable food.

The same inquirer asks for the capacity of a round silo, twelve feet in diameter and twenty feet high. Such a silo, if well filled, so as to contain, say, eighteen feet in depth of settled silage, will hold not far from thirty-five tons.

AN INDIANA RATION.

What am I to feed at the most profit? My contract price is eighteen cents per pound for butter the whole of the year.

Bran and middlings, mixed as they are in the wheat grain, cost me $12 per ton; oats 19 cents; add grinding, oats cost 23 cents, per bushel; ground oil cake, $30 per ton; clover hay, $6 per ton. Corn, net price 30 cents per bushel. I have no price on gluten feed or cotton seed meal, so if you can figure anything in a ration that I do not have, I am ready to buy it.

The serious dry weather has given feed a boom. How I long for the day to come when I can have a silo the only way for a dairy farmer. I. R.

Treaty, Ind.

We suggest for trial as follows:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
20 lbs. clover hay	16.94	1.36	7.16	.34
4 lbs. corn and cob meal	3.56	.26	2.52	.14
2 lbs. bran, etc.	1.76	.25	1.00	.06
2 lbs. gluten meal	1.84	.41	.97	.09
Total	24.10	11.65	2.28	.63

See advertisements for dealers in gluten feeds, and write for prices. If the corn and cob meal is not available, substitute three pounds of ground corn (corn chop).

FREEZING IN SILOS.

Wm. Bunte, who lives in Taylor county, Wisconsin, has only four cows at present, but we venture the prediction that in less than ten years he will be far ahead of many farmers who now have four times as many cows, and other things in proportion. He has learned that there is a difference in cows and he does not propose to keep or to raise cows that will not pay him a profit. To aid him in obtaining knowledge of the cows to keep, he has a Babcock tester, and the result is that of one of the four cows, he writes: "I send her next month to the butcher; test is too low." He has been using a grade Jersey bull, and the cows to be kept are his get. This grade has done so well, that he is encouraged to buy a full blood, and has dealt with Mr. H. C. Taylor, of Orfordville, getting, of course, something in the Brown Bessie and Merry Maiden line. We surmise the animal is not yet a year old, for he asks about the amount of service that can safely be had from yearlings and older. There is no reason why a well-grown bull may not safely serve ten to fifteen cows before he is two years old, provided they do not come too much in a bunch—never more than one service in ten days. After reaching two years, double this amount of use may be had.

Mr. Bunte also asks about the freezing of the contents of a stave silo. Those who have used this style of silo claim that the frost does not penetrate very far, and that no injury results to the silage.

Write to Prof. E. H. Farrington, Madison, Wis., about having a sample of milk tested at the Dairy School.

POWERS FOR FARM PURPOSES.

S. G. T., of Suldal, Wisconsin, requests us to submit the following question to the readers of HOARD'S DAIRYMAN in order that he may obtain the ideas of practical men in regard thereto. He is keeping from eighteen to twenty cows, and asks which would be the most practical light machine for running a feed cutter and farm separator; a steam engine, gasoline engine or tread power? He also asks whether a two-horse tread power would be too heavy to run a separator.

We are very glad to refer this question to our readers and thereby avoid, in some measure, entire responsibility for specific reply, as well as to give them who will consider it, a chance to realize how difficult (if not impossible) it is to answer such inquires satisfactorily. There are many who can most truthfully say they have found the tread-power quite satisfactory; others who can give similar testimony in regard to steam engines—especially such as use coal oil for fuel; and others, few in number as yet, who think the gasoline engine about as near practical perfection as can be expected. But all this does not answer the specific inquiry as to which is the most practical.

All the same, testimony along these lines will be valuable just as the illustrations in this issue of various cow ties and stalls are valuable, and we shall welcome communications setting forth the practical results which have been obtained.

PRICE FOR MANUFACTURING BUTTER FROM SEPARATED CREAM.

The same inquirer also asks what price is generally charged at creameries for making butter where the cream is skimmed at home.

This will depend upon the amount of cream furnished. Where only here and there a patron sends cream, with the great majority sending milk, the creamery cannot afford to make any reduction as the bother of handling small lots will fully offset the gain. If enough cream was supplied to make it possible to get along with one less separator, one might expect some abatement in the charge.

The writer has used a separator on his farm for years, but pays the same price for making the butter as his neighbors and finds his profit in the improved quality of the skim milk and less expense for hauling.

CALF SCOURS.

What is a good remedy for scours in calves that are from four to eight weeks old?

Cazenovia, N. Y. J. H. S.

Look after the feed, as there is probably something wrong there either in quality or quantity. Indigestion is the most prolific cause of scours, and indigestion is almost always caused by improper feed.

In connection with attention to the feeding, try one of the following remedies:

1. Pulverized charcoal made into a rather firm paste by mixing with molasses; a tablespoonful three times a day, or oftener in bad cases.

In the absence of medicinally prepared charcoal, take any wood coal, pulverize as fine as possible and sift through a coarse cloth or fine seive.

This is also an excellent household remedy for stomach and bowel trouble of any kind.

2. Equal parts tincture of opium, rhubarb, cayenne, essence of peppermint and spirits of camphor; a teaspoonful in a little warm milk three times a day. This is substantially the recipe given by Dr. Squibb, of N. Y., in 1866, as a cholera preventive and diarrhœa cure.

COTTON SEED HULLS AND CLOVER HAY.

Clover hay is worth $14 per ton, cotton seed hulls $4.50 or $5. Can I profitably use some cotton seed hulls in rations for my cows? W. G. S.

Norfolk, Va.

Something will depend upon the other feeds available and their cost. We submit two formulas which will illustrate this and possibly furnish a basis for W. G. S. to draw conclusions from:

NO. 1.

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
10 lbs. clover hay	8.47	.68	3.58	.17
8 lbs. hulls	7.21	.03	2.65	.14
4 lbs. corn	3.56	.32	2.67	.17
4 lbs. bran	3.52	.50	1.54	.12
2 lbs. cotton seed meal	1.84	.74	.34	.18
Totals	24.60	2.27	10.78	.78

NO. 2.

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
20 lbs. clover hay	16.94	1.36	7.16	.34
3 lbs. corn	2.67	.24	2.00	.13
3 lbs. bran	2.64	.38	1.16	.09
1 lb. cotton seed meal	.92	.37	.17	.09
Totals	23.17	2.35	10.49	.65

A CALIFORNIA RATION.

Will you please make up a balanced ration for me out of good corn silage, bran, corn meal and good alfalfa hay. A. C. S.

Los Angeles, Cal.

The above presents a combination of feed stuffs not often found, but we believe it will be found to be almost ideal, and we beseech A. C. S. to do some experimenting in order to determine what selections to make and the best proportions to use. We would like to see some of this alfalfa hay finely chaffed and mixed with the silage, equal parts by weight, or again two parts silage to one part chaffed hay and then ground corn mixed with this mixture in such proportion as to allow each cow about eight pounds of corn daily, and all the alfalfa and silage each will eat. In contrast with this, feed the silage and alfalfa (none of it chaffed) separately, using the same amount of corn and mixing it with the silage for feeding. For a third experiment feed the silage and alfalfa as above, but mix bran with the ground corn, equal parts by weight.

Weigh and test the milk each day and keep up each feeding trial not less than ten days and report the results for publication in HOARD'S DAIRYMAN.

The following formula shows our estimate of the probable average amounts that each cow will probably require:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
20 lbs. silage	5.28	.26	2.80	.14
13 lbs. alfalfa hay	11.91	1.43	5.15	.16
8 lbs. corn	7.12	.63	5.34	.34
Totals	24.31	2.32	13.29	.64

If half bran and half corn was used the figures would be as follows:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
Silage and hay as above	17.19	1.69	7.95	.30
4 lbs. corn	3.56	.32	2.67	.17
4 lbs. bran	3.52	.50	1.54	.12
Totals	24.27	2.51	12.16	.59

CRIMSON CLOVER QUESTIONS.

In accordance with the article on Crimson Clover, on page 598, would like to ask if you think it is too late now to sow it in this climate, also will it thrive if sown in the spring?

Decatur, Ill. F. C. B.

See article on crimson clover on page 631 of the DAIRYMAN.

INFORMATION WANTED.

It is impossible to get too much information regarding the breeding and testing of the dairy cow. Every year brings a new lot of dairymen, and, also, a new crop of calves, which should be fed, milked and bred in a manner to give the largest returns. In many cases the returns will be satisfactory; others, through want of the right kind of knowledge, have not made the success which they anticipated. From both classes much valuable information can be derived; to know where and how one has failed is as valuable, as to know why another was successful. We shall be glad, therefore, if a number of the readers of the DAIRYMAN, and the larger the better, would send us answers to the following questions, taking care to give their failures as well as successes:

1. Have you tested your herd, by weighing the milk and the Babcock test, to find which were the poor cows?
2. How long did you test, and how many did you reject? (Give the whole number of the herd at the beginning of the test.)
3. Is it much trouble or expense to do this, and what plan did you pursue?
4. Have you ever taken a herd of common cows, placed a registered sire at their head, and so kept up the system, until you brought out of it a herd of grade cows?
5. What was the breed you selected, and how much more butter, cheese or milk did you get from the daughters than the original mothers?
6. Would you advise changing breeds, one after another, or breeding right along in the same line?
7. Have you ever bred the daughters back to their own sires, and if so, what was the effect on the health and dairy capacity of the grand daughters?

NOTE—We want as many short, brief answers to the foregoing, from as many different men as possible. Make the answer to each question short as is possible; simply state the facts, not opinions. Do not worry about the style or grammar of your statement. Answer each question by number, and state your experience.

A FOOLISH MILK ORDINANCE.

The rules and regulations formulated by city boards of health for the regulation of the milk supply of cities, frequently contain regulations which could only be made through complete ignorance of a practical knowledge of the dairy and dairy work. The following is a good example of such a foolish regulation, passed by the Board of Health, of Rochester, N. Y.

Section 3.—No person, firm or corporation, shall have in his or its possession for sale, or shall offer for sale in the city of Rochester, any unclean milk, and for the purpose of determining the standard of cleanliness of milk it is hereby declared that in any sample of milk found to contain more than 100,000 bacteria per cubic centimeter, the said milk is declared to be unclean, unfit for use, and dangerous to health. Any person, firm, or corporation violating the provisions of this section shall be subject to a penalty of $50.

When is the determination of the number of bacteria in the sample to be made? Considering that under favorable conditions a new crop of bacteria is formed every twenty minutes, the question is of vital importance to the milk dealer. He *might* bring in milk in the morning which would pass inspection and yet be liable to arrest and fine before he left town. But although such milk might be supplied under the most favorable conditions of cleanliness, yet it would be safe to assert without fear of contradiction, that there is not a milkman in Rochester able to supply milk containing the minimum number of bacteria.

The stables, the cows, and the milkmen, all contribute their share to the bacterial content of the milk pail, and the conditions under which milk of the above purity can be produced, do not exist in a dozen places in this country.

Milk drawn under precautions of great cleanliness, has been found to contain 60 to 100,000 bacteria per cubic centimeter, and the same milk kept in a cool cellar at a temperature of fifty-six degrees for two hours, contained four times as many, and in six hours 435 times as many, or 43,500,000 bacteria per cubic centimeter. Moreover, there are but very few species of bacteria found in milk which are harmful, while many of them are positively beneficial.

What chance has the average milkman to comply with such regulations? Or what possibility is there of the ordinance being enforced? Especially when it is stated that the Rochester milk is from twelve to twenty-four hours old before it reaches the consumer.

It will simply be a dead letter and an excellent example of misplaced enthusiasm on the part of the Rochester Board of Health.

Note and Comment.

What Five Representative Men Said.

ED. HOARD'S DAIRYMAN:—"Another case of lost opportunity," said a hard-headed old farmer this morning. "The lesson finds me unprepared the same as the rest. Here cheese goes, bounding along, better than 'leven cents, and milk at ten cents in early September—something that has not happened before since Grant was president, and such a chance to make money out of a dairy; but, gosh a'mity, you fellows have told us year after year to be ready for a drouth with a lot o' green stuff, last year's silage left over on purpose, etc., but who listened? Think of it! I know of only two men who are prepared, and how they do rake in the money;and the rest of us a lookin' on. These two fellows are a gettin' as much milk as last year. Oversupply aren't worrying them much. Other folks' cows giving next to nothing, and theirs swimming along in the six and seven thousand record notches. Lots of the farmers do not have even water on their farms, now that the nasty old pond holes have gone dry. Lots of dairies have drank the muskrats and mud turtles out of house and home, because it costs too much to dig a well and put up a windmill."

"Different next year? Say, how long have you lived in this country? Every dairyman have all the soiling crops he can feed next year? You see if there is two acres and a quarter more oats and peas, millet and fodder corn set out next spring, than last; or two wells drilled and riggings put up. What will I do? If I was young as I once was, I'd have all the modern dairy fixings, but I am getting old and suppose that,—

"Say! What a tarnal lot of fools there is alive yet. Don't you know it?—That's luck! There goes all of my cows into what little corn Smith has got, and now you can't keep them out of there. This month's milk check will have to go into that soiling crop of Smith's now. Guess I'd better raise an extra crop for 'em to break into next year."

And the old man was gone whistling for dogs, and hollering "whe-y-y-y-y."

***

"I wonder if the everlasting 'goin' to shut down on silage milk in the city *right away*,' is not about over," said a wide awake citizen, who keeps pretty close tab on current affairs. "Do you know that within six miles of you to the north and west, forty silos have been and are being built this fall, and every one of these farmers is shipping milk to Cleveland? And there were over 125 silos in the three towns before these were built. This looks as if the silo had come to stay, and silage milk was not such very bad stuff either.

"I travel about a good deal, and did you know that Northern Ohio had become a land of silos? You come across them in the most unexpected places; men have them that you would never dream of building one. What kind are they building? The majority I should say were square ones with corners clipped, single boarded inside. Some are building stave silos and quite a number are using wire fencing for hoops.

"Looks too as if the fellow with the corn knife would lose his job and have to go and fight the 'Phillips.' There are eight corn harvesters at work in town to-day, all bought this year, and its the same everywhere. Then the self feeding silage cutter. Why down at Broadbrow's to-day, five teams could not bring corn as fast as it would go through that eighteen-inch machine? They never stopped to cut bands at all. Say! the cut silage came down that old 'trowsers leg' from the hopper box, ten bushels a minute, I do believe. But say! it is fun to fill silos now. Ten acres a day. Where's Denman Thompson and his steers now-a-days?."

Kindly, Sammy! hold on and give me the balance of this chapter next week.

***

We met the largest, we think, cheese factory owner in Ohio last evening, and asked him how he was getting along in his twenty factories. "Why prices are running up, and the milk in both amount and quality is running down this fearful dry weather. I can't see why farmers who live by their dairies should not take some sort of interest in their affairs, and see that the promotion of their own interests promotes mine; but not one in ten of them care a —— goose hair about it. Nothing to make ten-cent milk with and care less about the condition of what they do bring. There has got to be some kind of a reform inaugurated in Ohio factories. Cows now are cleaning up old swamp feed because it is a little green, and the tastes we get in milk are a caution. Rotten water raises the deuce. The cows drink it, stand in it, and this filthy stuff gets into the milk in two ways. And another thing, the patrons must draw home whey in their milk cans, and this bad practice spoils lots of milk, and we get all sorts of 'starters' we do not want. I wish the factorymen in Northern Ohio would stand up fair and square and demand three things of their patrons, and not snap up every fellow who is dropped at another factory, for nastiness. The three things are: Patrons must supply cows with clean, pure water and abolish field cavities; cool and aerate milk before coming to the factory; stop drawing whey home in milk cans, and old rusty tinless cans must go. And I guess I might as well put in a fourth clause—something that would stop all skimming and tampering with milk—buy all milk by the Babcock test, and pay a man for just the quality of milk he brings. How do you like this sort of treason in Ohio? We are going to get left worse than we are now unless there is a great reform in cheese making in this section, and you may say —— "

Of course I will, and do it in HOARD'S DAIRYMAN, *verbatim et literatim.*

***

The other day one of the Streighest fellows in the cheese business in the state called me up over the 'phone to say that he thought there needed to be a wake-up among the cheese and butter makers of the state, and at least 300 of them go down to Hunt's Dairy School and take from three to thirty-three months (as the case might require) of instruction, and find out at least how to set a vat of milk, i. e., heat it up, and ripen it as it should be so that the maker could control the curd, rather than have it "run him in."

"We are going to make inducements to all of our makers to have them go to Hunt's school or Wisconsin, as they may choose, the coming winter. We have a lot of good makers, but the scientific why and wherefore of doing it, and the uniformity that would follow such knowledge, would be worth thousands of dollars to us, this year alone. I am ready to indorse a law that a man to run a factory or creamery of any kind, should be a graduate of a No. 1 dairy school, and then pay him wages enough to make it an object to get this education. Oh, I could tell you a sight of stuff about our makers, that would, in the main, be different if they were up to date graduates of a good school."

***

"I am watching with a good deal of interest the effect that the building of so many electric roads out of Cleveland is going to have upon the milk business of that town," said a milk dealer to me recently. "Already there are five of these roads entering the city, each with a mileage of from twenty to sixty miles, and three of these roads run through great dairy localities. The Oberlin Electric runs half its way through a dairy territory, tapping the great Wellington dairy district. The Medina Road, now ready to iron, runs through dairy farms all the way for forty miles, and the A B C road is naturally a milk carrier. East of the city, two roads are all ironed and cars ready to run, both passing through eastern Cuyahoga, and clear across Geauga county, the great dairy center of the Western Reserve, and another road is building across Northern Portage and Trumbull counties, where milk runs galore. All of these electrics run through territory away from the steam ways, and with their cheaper freights and easy delivery to any part of the city, and hourly service, I look to see a great change in the city milk and cream business.

"The way the cream trade is looming up of late, it looks as if a man could cream his milk at home with a separator, send it into the city cheaply by the electrics, feed the milk at home, and change for the better the new factory way of dairying. I see that Haserot is now convinced that the way for him to conduct his proposed condensary, is to locate it near the city where two or three of these electrics "junct" and have the milk sent in on special milk cars. I understand that on the Dodge road now being built, they propose to deliver milk and cream to certain localities. You put a freight stamp on the can, and tag it to any milk depot and they will deliver it. And then the farmer's customer goes to a milk station and gets his can of cream, or milk, without any peddling about it, or any tampering with milk preservatives, or Freezine.

"You mark me, that within the next five years you will see the whole milk trade of Cleveland take a shift, and there will be something less than 986 milk peddlers in the city, and we shall get a much better quality of milk. Of course there is liability of an over supply just as there is now at times, but with these nine electric lines, and the ease that the milk can be handled and cared for at home, and the facility with which it can be put into town when wanted, makes a different matter of it than with the steam roads with their now or never delivery, and the costly and unsatisfactory distribution.

"Now you mark what I say;" and with twirl of his cane and a polite farewell, our prophet and railway friend was soon lost to view but not forgotten, because of this record.

JOHN GOULD.

"What's in a Name?"

Everything when you come to medicines. A sarsaparilla by any other name can never equal Hood's, because of the peculiar combination, proportion and process by which Hood's Sarsaparilla possesses merit peculiar to itself, and by which it cures when all other medicines fail. Cures scrofula, salt rheum, dyspepsia, catarrh, rheumatism, loss of appetite and that tired feeling.

Hood's Sarsaparilla
Never Disappoints

Hood's Pills cure liver ills; the non-irritating and only cathartic to take with Hood's Sarsaparilla.

The Rule at the World's Fair.

Mr. Gillet's Rejoinder.

ED. HOARD'S DAIRYMAN:—I note your very courteous comment on my former writing, "The Rule at the World's Fair," and trust you will see fit to allow me a few words further on this subject, in that you take the ground in the comments to which I refer, that I am not not justified in my claim that the 80% plan was a rule at this fair for estimating the amount of butter from the fat in the milk.

Upon a still farther investigation of the facts in the matter I am fully convinced that all of my statements were correct and that the DAIRYMAN was technically wrong in conveying the impression that they were untenable.

The evidence that you bring forth to show the error of my claim is taken entirely from tests No. 2 and No. 3. No one has ever claimed that the 80% rule was applied in these tests. No one has ever claimed that the butter reported from these tests was estimated from the fat in the milk. No one has thought of denying that the churn was used in tests No. 2 and 3 at the World's Fair, nor have I any disposition to convey that impression, but I must reiterate, and without juggling with the facts, that in any and all

Who Has The Best Milk?

The man who uses the CHAMPION Milk Cooler Aerator. Our book about it free.

CHAMPION MILK COOLER COMPANY,
67 Main St., Cortland, N. Y.

tests, whenever and wherever the churn was not used the butter was calculated from the fat in the milk, and that 80% was the ratio and the only basis for estimating a pound of butter; that this was the case in tests No. 1 and No. 4, and farther that the butter so estimated in test No. 4, was credited to the heifers at forty cents per pound, there being no butter to score.

In regard to test No. 1 allow me to again quote from Mr. Fuller's report: "No churning was made of the milk during this time, but by taking the quantity of fat ascertained in the milk and multiplying it by 125, we ascertained the quantity of butter that I have credited to the cows as 80% butter, being approximately near the quantity of butter as can be ascertained, except by the churn."

You say "the butter yields reported by Mr. Fuller, were wholly independent of any and all rules etc." If there was no other rule for estimating the butter from the fat in the milk, and the 80% rule was used, the only logical conclusion is that it was a rule at the World's Fair, whether there was any formal adoption of it by the Board of Managers or not. It would appear to me that what was permitted without protest was accepted and established, and it does not occur to me that either Mr. Fuller or Chief Buchanan acted in this matter beyond the limit of their authority.

In any event, in tests No. 1 and No. 4, the only ones where the butter was estimated from the fat in the milk, the 80% rule was the only one used, and farther than this, in test No. 4 the awards were made on the amount of butter calculated on this basis, which gives the Holstein-Friesian Association for purpose of comparison, ample justification for the adoption of the same plan and to maintain that it was a rule at the World's Fair without being censured for making misleading statements. If not, I would ask for an explanation of the language used by Mr. Fuller on page 21 of his report with regard to test No. 4; "The rules were amended by Chief Buchanan, etc." Does he not here allude to this matter as a "rule"?

And inasmuch as you have taken exceptions to statements made in my former communication, permit me to ask if there was any other rule at the World's Fair but the 80% one for estimating the butter directly from the fat in the milk? If so, what was the rule, where and when was it used?

At the time of this fair no one criticised the method of calculating the butter on the eighty per cent basis, and as I have indicated before it was adopted by our association, because it was used at this time and at this fair. I have never before seen it disputed by any authority. I have said that the DAIRYMAN was technically wrong, and this from the fact that you use test number two and num-three to prove your ground. We all know that in these tests the churn was used, and the eighty per cent as here applied was on the fat in the butter. And in this it was no difficult matter to show that the claim of the association is untenable, but if we do not seek to dodge the question, and look the matter up carefully in tests number one and number four we will find only evidence that will substantiate our claim.

To settle this controversy, I am willing to submit the following from tests number one and number four, using only the totals and rest the case by allowing the many readers of the DAIRYMAN to judge for themselves as to the ratio used in estimating the amount of butter reported from these tests. I therefore here submit the totals of fat and estimated butter as credited to the breeds participating.

TEST NO. 1

	Fat in Milk. Lbs.	*Butter Credited. Lbs.*
Jerseys	602.01	752.56
Guernseys	488.42	610.53
Short Horns	436.60	545.75

TEST NO. 4.

	Fat in Milk. Lbs.	*Butter Credited. Lbs.*
Jerseys	155.38	194.226
Short Horns	97.89	122.362

Certainly the eighty per cent method as here applied was not to estimate the fat in the butter because there was no butter made, It was to estimate the amount of butter from the fat in the milk, exactly what is claimed by the Holstein-Friesian fraternity.

W. J. GILLETT.

Rosendale, Wisconsin, Sept. 19, 1899.

There can little profit result from prolonging the discussion about "The Rule at the World's Fair." Mr. Gillett and the DAIRYMAN agree as to the facts, and further controversy would be simply an interminable dispute about words.

It seems very plain to us that the "rule" by which the butter yield of the cows was determined did not permit the addition of twenty-five per cent to the fat in the milk. An exception was made in the case of the twenty-one-days tests of the heifers—although Mr. Fuller says in the paragraph cited by Mr. Gillett that the butter was estimated "on the basis of eighty per cent oil in the butter."

That Mr. Fuller follows a vicious rule, in estimating the possible yield of butter from the milk which was made into cheese or that was given by the heifers, does not in our opinion justify anybody in saying that this was *the* rule at the World's Fair. At most it was only an exception, and Mr. Fuller states explicitly that the credits given by him on this basis are in excess of what could actually be obtained. There is no official record of butter, or estimated butter, for tests numbers one and four, and consequently Mr. Fuller's figures cannot with propriety be said to follow even a rule at the World's Fair. Much less do the facts justify the statement appended to reported tests of Holstein cows, that the amount of butter is estimated in accordance with *the* rule at the World's Fair.

Individuality of the Cow.

We have known farmers to pooh-pooh the idea of studying cow individuality. They said it was not practical in a large herd and was unnecessary; and often they went on wasting grain on some cows and not getting out of others what could be got out of them. Certainly every cow's milk should be tested. There is but one side to that proposition. Whoever does not agree with it is living too far back in the darkness to afford the slightest excuse for a live man to argue with him, and a dead one cannot. But that test does not end the matter. The milk of a cow may test well, but in time that cow will be found taking on fat, and if individuality cuts no figure with her owner, she will continue to convert feed into fat, and her milk yield will become less and less. If the dairyman is watching every individual of his herd, and observing her peculiarities, when he sees this fat-making tendency, he will cut down the cow's ration, and if she still takes on fat, he will send her to the shambles, or sell her to somebody who does not regard the study of individuality as important.

THE LEAN COW.

Another cow may be pouring nearly all her feed and part of herself into the milk pail. It is often said that a cow will first take care of herself before she will make milk out of her feed. She does not always do it. There are cows that seem intent on making milk and nothing else. They utterly neglect to feed their systems, and such cows will become thinner and thinner. If we are watching the individual and observe a cow like that, we will increase the ration and keep on increasing it as long as we can get returns. It is a little trouble—but not so much after all—to vary the rations to suit different cows. The cow that is taking on flesh should have very little, if any, fat forming food. Eliminate the corn meal, or other similiar ingredient from her ration. Feed her wholly or mainly on nitrogenous foods. For the thin cow increase the fat-forming elements.

BURNING UP THE COW.

There must be a reasonable limit, however, in feeding fat-forming feed. Prof. Otis very truly says a true dairy cow, fed on a ration rich in protein and light in carbohydrates, will continue to develop for years, both in ability to consume feed and to yield milk, and properly handled does not reach her highest yield until eight or ten years old, and is then good for from five to eight more years of profitable work. A cow heavily fed on a ration of average composition, greatly deficient in protein and high in carbohydrates, does burn out and will not last long.

THIS YEAR'S FEEDING AND NEXT.

This year's feeding increases next year's yield. A cow high fed this year will give better returns for food consumed next year than one having a light ration now; and the skillful dairyman can, by studying his cow, gradually increase from year to year the amount of feed consumed and the yield of milk produced per pound of feed eaten for a number of years. In this work of developing, the poor cows will reach their limits much earlier than the good ones, and can be fattened and sold.

CALF AND COW.

We fully endorse what Prof. Otis has said. As has often been said, the proper feeding of a calf develops its capacity for being a heavy feeder when it becomes a cow; and a similar method of feeding will increase the capacity of the cow. If the calf is fed largely on concentrated feed, its digestive apparatus is contracted; if it is fed on fat forming food, it contracts the habit of taking on fat. To a lesser degree the cow's digestive functions may be injured by too much concentrated food and not enough roughage or bulk; and it is possible to make her too fat by feeding too much of the carbohydrates.—*Delaware Dairyman.*

Sure Cure for Colds

When the children get their feet wet and take cold give them a hot foot bath, a bowl of hot drink, a dose of Ayer's Cherry Pectoral, and put them to bed. The chances are they will be all right in the morning. Continue the Cherry Pectoral a few days, until all cough has disappeared.

Old coughs are also cured; we mean the coughs of bronchitis, weak throats and irritable lungs. Even the hard coughs of consumption are always made easy and frequently cured by the continued use of

Ayer's Cherry Pectoral

Every doctor knows that wild cherry bark is the best remedy known to medical science for soothing and healing inflamed throats and lungs.

Put one of

Dr. Ayer's Cherry Pectoral Plasters *over your lungs*

Relative Feeding Values of Oats and Bran.

ED. HOARD'S DAIRYMAN:—In Prof. Henry's chapter on Feeding in the government publication entitled Diseases of Cattle the following figures are given as amount of digestible nutrients in 100 lbs. of bran and oats:

	Bran.	*Oats.*
Protein	12.6	9.1
Carbohydrates	44.1	44.7
Ether extract (fat)	2.9	4.1
Nutritive ratio	1:4.0	1:5.9

In your last number you state that oats are ten per cent more valuable than bran for feed. How can the above analysis and that statement be reconciled?

It seems to a "freshman" just the reverse, or that bran is the more valuable feed; so we seek information from the head-light.

Nashville, Tenn. READER.

We are very much obliged to our Tennessee friend for calling attention to this matter and wish that more and more of our readers would exercise equal scrutiny and call us to book whenever there is an apparent error in what we write. This gives us the opportunity to withdraw from untenable positions, or to explain further—as in the present case—and clear up the seeming error.

We may say, in the first place, that experiments and analysis made since the book referred to was published, have caused some slight modifications in the figures there given.

At the present time the average for the feeds named is given as follows:

	Bran.	*Oats.*
Protein	12.6	9.2
Carobhydrates	38.6	47.3
Ether extract (fat)	3.0	4.2

But even these figures, if no other elements enter into the problem, do not justify the statement that oats are ten per cent better than bran, and, yet in actual trial with milch cows at the Wisconsin Experiment Station this difference was found.

Although the reason for this apparent exception to the rule that figures cannot lie, is not very far to seek, it is not altogether an easy matter to find it, and, when found, to explain it. It will be recalled by many of our readers that HOARD'S DAIRYMAN has quite frequently called attention to the fact that it requires the expenditure of energy to digest food and conversely that it requires food to supply energy. Food-stuffs differ very materially not only in the per cent of total digestibility but quite as much perhaps in the amount of energy required to produce this digestion. Bran is not so easily digested as oats and hence the available digestible nutrients do not run in the same proportion as the total digestible nutrients.

By a most opportune coincidence almost simultaneously with the receipt of the foregoing communication from Tennessee there came to our table a copy of the London *Live Stock Journal* in which this identical question is very fully treated by Dr. M. H. Hayes, a Fellow of the Royal College of Veterinary Surgeons. It is the thirtieth paper on the general subject of Stable Management and Work and in regard to Chemical Analysis as a Guide to the Feeding Value of Foods, he says:

We can draw only general conclusions from chemical analyses of foods; because (1) the respective percentages of the constituents of plants vary greatly according to circumstances which will be presently considered; (2) the nutritive matter of food—bran and hay, for instance, may be so protected by crude fibre and other substances from the action of the digestive juices, that they may lose a large proportion of their feeding value; (3) neither the percentage nor the presence of ferments is indicated by the analysis at our disposal.

FERMENTS IN GRAIN.

We learn from the researches of Horace T. Brown (CHEMICAL SOCIETY'S TRANSACTIONS, 1890, pp. 458-528; and 1892, pp. 352-364) that certain grains contain a greater or less amount of an unorganized ferment (ENZYME) which during digestion, has the power to dissolve the walls of the cells of the grain, and thus to expose their contents to the action of the digestive fluids. The membrane which forms the walls of these cells, is thin, tender, and is composed of nearly pure cellulose. The enzyme in question has no power to attack starch or the crude and more or less lignified fibre of hay, and does not become fully developed in the grain until the grain has become ripe. True ripening of the grain takes place only after more or less of the original moisture of the grain has been given off. The abundant presence of this enzyme in good oats furnishes us with an explanation of the great rapidity with which the contents of the grains become broken up in the early stages of digestion, and confirms the high estimation in which oats are held as a food for horses; for without this enzyme a considerable portion of the flour of the oats would be unaffected by the gastric and pancreatic juices, and would enter the cæcum undigested. "The animal itself, besides affording a favorable temperature, a suitable mixture of fluids, and plenty of mechanical movement, does not contribute to the dissolution of the cell-membrane, which is wholly brought about by the enzyme pre-existent in the grain" This writer (PROCEEDINGS OF THE ROYAL SOCIETY, 63, 1898, page 3) has found that most of this enzyme exists in the inner layer of the husk.

This enzyme of grain, like those animal enzymes, ptyalin and pepsin, is a chemical substance, and is different from the ferments produced by bacteria. According to Gamjee, the activity of enzymes is destroyed by exposure to a temperature of 126 deg. Fahr., which is a fact that probably explains the reason why the feeding value of good oats becomes lessened by the process of kiln-drying or parching. Barley, which either contains very little of this enzyme or is wholly deficient of it, is almost always improved by parching.

Diastase is an unorganized ferment that converts starch into sugar, and thus renders it soluble. It is formed only during germination, as in malting.

Cerealin is an enzyme which occurs in bran, and which was discovered by Mège Mouriès. Its action is similar to that of diastase, but is much slower.

Result of Poor Milk.

A certain class of patrons delude themselves, that their work consists solely of delivering the milk regardless of quality. That they should be held responsible for its condition, is shown by the following from *Chicago Produce*:

In a letter on cleanliness W. J. Kennedy says: In butter one of the most annoying effects of undesirable bacteria is the earlier development of butyric acid and the consequent rancidity of butter. From some experiments made here at the Iowa college creamery, in regard to the keeping qualities of butter made from cream that had been separated from milk, which had been exposed to unfavorable conditions that are so frequently to be met with, and other cream that was free from all undesirable kinds of bacteria, I am firmly convinced that uncleanly conditions are more directly responsible for rancidity in butter than is indicated by any authority that I have read upon that subject. While it is possible by resorting to pasteurization and pure culture starters, to improve the quality of butter made from milk that has been poorly cared for, I think it is admitted that there is no process by which poor milk can be made to produce the very best butter or cheese. We must also bear in mind that while commission merchants purchase the poor butter with reluctance at a lower price than is profitable to the producer, they are eagerly watching for the very best, and will often pay from half a cent to one cent a pound above market quotations to customers who can always supply them with the very finest article.

Paraffin as a Food.

Coleman's Rural World under the heading of "Fraud that is Damnable," prints the following vigorous editorial on the use of paraffin in oleo:

On the eighth page of this issue will be found an article which consumers of butter should read. It tells how some of the makers of oleomargarine are doubling up in their nefarious practices. Not content with making a substitute for butter out of animal fat and selling it for the genuine article, they have searched the world over for means and methods by which their goods can be more cheaply produced, yet retain the appearance of butter so that they can be sold to the uninitiated for butter and at butter prices. This, too, regardless of statute laws which these counterfeiters break with as little compunction of conscience as ever troubled the most hardened criminal. Not only will these miscreants, some of whom pose as philanthropists, rob people of their money by substituting an inferior article for a good one, at the price of the latter whenever possible, but they will undermine and destroy human health by putting into their goods deleterious substances. In the article to which we refer it is shown that not only is water to the extent, sometimes, of thirty-five and forty per cent incorporated in the oleomargarine, but nine and one-half to eleven and one-half per cent paraffin is worked in to give a firm body to the cheap fats and oils which comprise the remainder of the substance. Not satisfied with what can be found on the surface of the earth in the way of refuse animal fats and cheap vegetable oils, they draw from earth's bowels a substance which nature never intended should be used as food, and work this into their product.

What is paraffin? "A colorless, odorless, translucent, waxy, solid mixture of hydrocarbons derived from methane, rich in carbon and indifferent to most reagents. It is contained in bituminous coal and petroleum, from which it is separated by distillation." We quote from a standard authority.

"Indifferent to most reagents." What does that mean? Simply that the most powerful acids, such as are used in the chemical laboratory for making tests, have no effect on this substance. It resists even the tooth of time which can be said of but few substances on this mundane sphere. *Rural World* readers will remember that in 1881 there was set in Central Park, New York, a granite obelisk called Cleopatra's Needle, an Egyptian monument centuries old. It was soon discovered that it was being ruined by the action of the weather, and as a means of preventing the destruction it was, in 1885, given a coating of paraffin, and the statement is made that "the obelisk has since successfully withstood the influence of the atmosphere." Can the stomach of a human being then be expected to digest this substance, even though the makers of oleomargarine say that it is "perfectly wholesome," "just as nutritious as butter," and a lot more that is as false as is their goods?

Paraffin is a bi-product in the refining of crude petroleum, and is produced in immense quantities by the Standard Oil Company. Evidently this monopoly has made a combination with the meat packing combine by which the refuse bi-products of each shall be crammed down the throats of the people they being made to pay a fancy price for the nasty stuff, law or no law. What think you of the business.

Annual Report of Michigan Food Commissioner.

The annual report of the Dairy and Food Commissioner, of Michigan, which has just gone to press, contains a complete record of his department's work for the fiscal year ending June 30, 1899, and is briefly summarized as follows:

"The Commissioner reviews the difficulties with which he was confronted, on taking charge of the Department, owing to the fact that there were no decisions in Michigan touching food questions, and there existed in the state a growing belief that the laws either could not or would not be enforced.

"Technical questions were raised as to the intent and constitutionality of the various statutes, and the department was forced five times to seek final judgment in the Supreme Court of the State.

"As a result, no State in the Union is more strongly fortified to-day than Michigan with questions of food legislation, and food litigation, correctly and authoritatively interpreted.

"Although restricted by a limited inspection force a vigorous prosecution of the work of inspection has been carried on during the year. The stocks of 2,380 dealers carrying food products have been examined, in addition to which 1,190 special investigations were made.

"The butter and milk supplied to guests at 240 hotels and restaurants were examined, and 449 dairies inspected.

"The laboratory report shows 1,050 samples analyzed, and in addition to which valuable research work was carried on.

"Eighty-six cases were prosecuted and were either disposed of or are now pending

This is the chance of your life to get a bull calf to head your herd; send your bid to the auctioneer if you cannot attend. No postponement on account of weather.
SEND FOR CATALOGUE.
FRED ZIMMERMAN, Manager.

in the various Courts. Twenty-nine examinations were held, in thirteen of which the defendants were bound over to the trial Courts. Fifteen of the cases dismissed were oleomargarine prosecutions on questions of law, which the department now has before the Supreme Court for review.

Twenty-five cases were brought to trial, in twenty of which the defendants were convicted. Three of the cases lost were under a statute requiring the Department to prove the defendant's guilty knowledge, a defect in the statute which has since been remedied by the passage of a new law.

During the year the Department won an important case in the Supreme Court, establishing the fact that the Legislature, under the police powers of the State has power to set up a standard of purity for food products.

The decision has become a leading case in food litigation and is copied widely and cited with approval in other States.

The Commissioner considers conditions more favorable in Michigan ta-day than at any time in the past, but says that scarcely a week goes by but some new method of adulteration is found, but the shrewdness of disdishonest manufacturer keeps pace with the ability to detect and destroy.

He spreaks of the necessity for constant and frequent inspections to checkmate this kind of work and keep dishonest and careless dealers in line, and says the present policy of the Department will be continued and that prosecution will remain the reward for all wilful sales when detected, and will follow in cases which show too glaring want of caution in the purchase of goods.

Butter Shipments.

Mr. Townsend, of the Astoria, Oregon, Creamery, has just finished making the second shipment of butter to Manila. The butter is shipped by Glafke & Company, of Portland, and is packed in one-pound glass jars, with a glass cover, and is hermetically sealed with wax. The outlook for a profitable trade in dairy produce in the Philippines seems to be excellent.

Use of Oleomargarine.

The farming community continues disturbed on the subject of the oleomargarine product. The pure food department of Pennsylvania sets forth that 87,800,000 pounds of this imitation butter were manufactured and sold in the United States during the year ending June thirtieth, last. Calculating the average annual yield of butter per cow at two hundred pounds, so much oleomargarine in the market takes the place of the butter product of 439,000 cows. This is presuming that all who bought oleomargarine would have bought an equal amount of butter, which is not unreasonable, inasmuch as most of the substitute product is retailed as butter. Assuming, then, that so many more cows would be needed to supply the demand for butter if no oleomargarine were made, and that cows are worth thirty dollars apiece, it can be figured out that the farmers' business is curtailed by a loss in profit making capital of $13,170,006. It is calculated that the profits on the manufacture of the amount of oleomargarine given are not less than $10,536,000, of which one-third is secured by the manufacturers and two-thirds by the traders. On butter there is no such great profit as on this compound of lard and tallow, that can hardly be distinguished from it, and would be purchased by comparatively few persons if they knew what they were buying. It is always possible to sell this spurious "butter" a little lower than genuine butter of acceptable flavor. It is plain that so much spurious "butter" never could be sold if it were called by any name indicating its real character, and, if the figures supplied by the Pennsylvania Bureau are trustworthy, there is no escaping the conviction that no laws yet passed have greatly prevented the sale of the compound.—*Boston Herald.*

DAIRY MARKETS.

ELGIN, Ill., Sept. 25—No offerings or sales. Committee reported firm, 22½c.

CHICAGO, Ill., Sept. 25—Butter—Creamery extras, 22½c; firsts, 19@20c; seconds, 15½@16½c; dairies, selections, 19c; No. 1, 16c; No. 2, 15c; extra ladle, 14½@15c.

Cheese—Full cream, Twins, new, good to choice, 10⅞@11¼c; Young Americas, 11@11½c; Swiss, 9½@11¾c; Limburger, 8@9¾c; bricks, 9@10½c.

Eggs—Fresh, at mark, cases returned, sold at 13@14c, loss off; cases returned, 16½c.

Cattle—Native cattle at $6.25@6.75, sold at steady prices, while other natives and, in fact, all other grades of cattle were about 10c lower. The general trade was dull. A load of 1,439-lb. polled Angus steers sold at $6.75 and 20 averaging 1,463 lbs. at $6.65. Most of the native beef steers sold at $5.30@6.10; corn-fed Westerns, $4.75@6.40; distillery-fed steers, 1,250@1,304 lbs., $5.55@5.60; grass Western steers, 980@1,366 lbs., $3.80@4.85; Western cows and heifers, $3.25@4.50; grass Texas steers, $3.20@4; poor to fair native cows, $1.75@2.70; good to fancy cows, $2.80@4.25; poor to choice heifers, $3@4.50; fancy heifers, $5@5.25; bulls, $2.60@4.25; stags, $4.60@5.50; oxen, $3.25@4.50; veal calves, $5@7.25, and feeding cattle, $3.60@4.60.

Bran—Firm, under light offerings, and sold at $12.25 on track, and $11.75 billed through.

MILWAUKEE, Wis., Sept. 25—Butter—Creamery—Fancy prints, per lb., 22½c; extras, 22½c; firsts, 21@22c; seconds, 20@21c; imitations, 19@20c. Dairy—Selections, per lb., 17@18c. Market steady and firm, requirements absorbing all kinds quickly; receipts, 14,639 lbs.

Cheese—American full cream—New, choice to fancy, 10½@11c. Brick—Per lb., choice, 10@10½c. Limburger—New, choice, per lb., 9½@10c. Swiss—Drum, 11@11½c; Block, 11@11½c; No. 2, 9½@10c. Market continues firm and trade fair; receipts, 41,620 lbs.

Eggs—Fresh, per doz., 16c, loss-off cases returned. Market steady and firm for fresh, trade being fairly active; receipts, 387 cases.

FOND DU LAC, Wis., Sept. 25—Offerings 670 Twins and 500 Daisies; market steady at 10⅝c for Twins.

MUSCODA, Wis., Sept. 25—Offerings to-day 1,400 boxes Twins; market active; all sold 10⅝c.

SHEBOYGAN FALLS, Wis., Sept. 20—Fourteen factories offered 1,308 boxes of cheese on the call board to-day and all except 148 boxes were sold as follows: 690 cases Young Americas at 10¾c; 80 Twins at 10⅝c; 65 at 10⅜c; 275 Daisies at 10⅜c, and 50 at 10⅝c.

MANITOWOC, Wis., Sept. 20—Offers of cheese at dairy board to-day were 560 Daisies, 66 Twins, 608 Young Americas. Sales: Daisies and Twins at 10¾c; Young Americas at 10½c.

PLYMOUTH, Wis., Sept. 19—Sales to-day 1,275 Twins at 10⅝c and 1,315 Americas at 10¾c. Market active.

HILBERT, Wis., Sept. 16—The sales on the call board to-day were 159 cases Young Americas at 10¼c.

SEYMOUR, Wis., Sept. 13—The sales on the dairy board to-day were 491 Twins at 10c and 343 Daisies at 10½c.

BRILLION, Wis., Sept. 15—Cheese—Cheese market, today: 1,700 Daisies at 10c; 845; Flats at 10c; 670 Young Americas at 10¼c.

ST. LOUIS, Mo., Sept. 25—Butter—Firmer; creamery, 19@24c; dairy, 15@20c.
Eggs—Firm; 14½c.

KANSAS CITY, Mo., Sept. 25—Butter—Creamery, 21c; dairy, 16c.
Eggs—Fresh, 15c.

CINCINNATI, O., Sept. 25—Butter—Quiet; 23c.
Cheese—Firm; good to prime Ohio flat, 11½c.
Eggs—Firm; 15c.

PHILADELPHIA, Pa., Sept. 25—Creamery 23c; prints, 24c. Market firm.

WASHINGTON, D. C., Sept. 24—Butter—Market firm. Extras, 23½c; first, 22c; choice imitations, 18c.

NEW ORLEANS, La., Sept. 25—Butter—Market firm at 24c; ladles active and scarce, 14@16c.
Cheese—Cream cheese 12c; skims, 7@9c.
Eggs—17c.

NEWARK, N. J., Sept. 25—Butter—Steady, 23c for strictly fancy Elgin only. Receipts fair.

BALTIMORE, Md., Sept. 25—Butter—Market firm. Creamery, separator, extra, 24@25c; extra first, 22@23c; creamery first, 21c; creamery, imitation, extra, 19@20c; ladle, extra, 18c.

Eggs—Market firm. Strictly fresh stock, 16½@17c.

BOSTON, Sept. 25—Butter—Creamery, extra, 23½c; western extra, 22c; dairy extra, 21c; imitation creamery, 16@17c; western ladle, 15@16c; print creamery, 24c; box creamery, 23c.

Eggs—Fancy near by, 24@25c; choice fresh, 20c; Michigan extra, 19c; western, 17@18c; fair to good, 16½c.

NEW YORK, Sept. 25—Butter—Creamery, Western, extras, 23c; firsts, 21@22c; state, extras, 23c; firsts, 21@22c.

Cheese—State, full cream, small, colored, fancy, 11¼@11½c; white, 11¼@11⅜c; large, colored, 11c; white, 10¾c.

Eggs—State, Pennsylvania, and Western, 20@18c.

UTICA, N. Y., Sept. 18—The only sale officially reported on the board to-day was one lot of 80 boxes of small white cheese at 11¼c. There were 30 lots, aggregating 2,225 boxes, reported to have been consigned. There was something of a boom in the butter market. The following sales were reported: 31 packages at 22c; 7 packages at 23c; 130 packages at 23½c; 67 cases of 1-pound and 5-pound prints at 25c.

LITTLE FALLS, N. Y., Sept. 18—Cheese weak with sales of 4,387 boxes at 10¾@11c, chiefly at 11c. With such good prices for cheese there is little inducement for dairymen to make butter, and the offerings here continue to be very light. A few sales of creamery and dairy were made at 22c.

WATERTOWN, N. Y., Sept. 17—Cheese—The cheese market here, yesterday, was very dull. Sales were few. Prices ranged from 10¼@10½c. It is very dry, and cows all have to depend on feed outside the pastures.

FULTON, N. Y., Sept. 18—Cheese—There were no sales made here today. Contracted cheese only were moved.

OGDENSBURG, N. Y., Sept. 18—Cheese—There were 977 boxes cheese offered here, Saturday. A bid of 10⅝c resulted in no sales on the board, but later on the street some cheese were sold at 10½@10¾c.

NORWICH, N. Y., Sept. 18—Cheese—The sales of cheese on the board, Saturday, were: 700 boxes of small colored at 11c; 200 boxes of small white at 10¾c; 200 boxes of skims at 9c. There were no sales of large cheese. A considerable number of sellers held out for 11¾c.

CANTON, N. Y., Sept 18—Cheese—There were 1,600 boxes cheese sold here, Saturday, at 11c.

Butter—800 packages of butter sold at 23c.

BALTIMORE MARKET.

BALTIMORE, September 21.—Butter.—Although the receipts of separator creamery fresh from the primary points this week have been lighter than usual at this season, and less than last week, yet there seems to be enough for immediate wants; the fact is that the position taken by the cutters is against the advance, and whether their stand is well or ill taken, if the consumers are content with the cold storage and other grades and varieties for a while, the shrinkage of milk from this or that cause in the gilt edge districts will cause us no distress. The grading is fair on an average, but the mottles and the mold are again noticeable; mottles alone in some marks, mold alone in others and mold and mottles in still others; proper care and labor would preclude both defects and make the receiver's lot, if not a happy one, at least less miserable, for it is extremely wearing to have to explain the why and wherefore so many times in the several seasons. There have been fair receipts of gathered cream makes as regards quantity, but the grading is lower than at any time since the cows went to graze this year; those mischievous m's aforementioned are herewi h also to be found, but in the superlative degree, along with another one of the same genus, to wit: "marbled;" nevertheless, when the mold is mown and the price of extra separators skillfully displayed such moral suasion proves irresistable and the recipts are disposed of effectually. The southern buyers now in the city are active in the pursuit of imitation creameries and ladles in thirty pound tubs, but prefer Record tins even to the extent of paying a slight premium over wooden thirties of the same grade; orders from the south have been liberal, but limited to Record tins in a majority of cases. Receipts of store packed are very light, and there is a good demand for all grades. Roll in good condition is inquired for and would sell at 14 to 15 cents.

Creamery Separator, extras, 23; firsts, 21½@22; seconds, 19@20. Creamery Gathered Cream, extras, 20@21; firsts, 18½@19; seconds, 18. Creamery, Ohio, extras, 20@21; firsts, 18½@19; seconds, 18. Creamery imitation, firsts, 16½@17; seconds, 15@16. Iowa & N. W. Ladle, firsts, 15@16; seconds, 14. Ohio & Indiana Ladle; firsts, 15@16; seconds 14. Ohio Storepacked, firsts 13½@14; seconds 12½@13. W. Va. Storepacked; firsts, 13½@14; seconds, 12½@13. Creamery Blocks, (2lb.), extras, 24½@25; firsts 23@24; seconds, 21@22. Creamery Prints (½lb.), extras, 24½@25 firsts 23@24; seconds, 21@22. Md., Va. & Penna. Prints, extras, 20; firsts, 19; seconds, 17@18.

Cheese.—Receipts of cheese fair; demand very good; market firm.

N. Y. State—Cheddars, fine, 12@12¼; choice, 11½@13¾; fair, 10½@10¾. Flats, fine, 12¼@12½; choice, 11¾@12; fair, 10¾@11½; Small, fine, 12½@13; choice, 11¾@12¼; fair, 10¾@11½. Ohio—Flats, fine, 11½@12; choice, 10¾@11½; fair, 10@10½. Picnic, fine, 11¾@12¼; choice, 11@11½; fair, 10½@10¾. Skims, 9@9¼; choice, 8@8½; fair, 7@8.

Eggs.—The supply of strictly fresh eggs is very light, and for this kind the demand is active at steady prices. Held and other eggs of irregular quality are not so eagerly sought after, and have to be sold on their merits. The market on all choice to fancy eggs is firm at 17 cents.

Latest quotations for fancy creamery; Buffalo 23c; St. Paul, 22c; Minneapolis, 22c; Detroit, 23c.

LIVERPOOL, Sept. 25—Butter—Finest United States, 95s; good, 72s.

Cheese—American finest white, 52s 6d; American finest colored, 54s.

"ALPHA - DE LAVAL" TRAVELING REPRESENTATIVES WANTED

Believing that 1900 will be the greatest year in the history of the dairy business, and knowing that the 1900 sales of "Alpha–De Laval" separators will be more nearly universal than ever before, as there is every reason why it should be, we shall add some ten or more men to our 1900 corps of traveling representatives within the next six months.

Candidates for these positions will be considered meanwhile and applications are now invited. A De Laval representative must possess a clean record as to personal character; have a thorough knowledge of both farm and factory dairying methods, preferably acquired through practical experience; possess the mechanical aptitude essential to quickly becoming a separator expert; be endowed with the natural energy and aggressiveness constituting good salesmanship, and be physically capable of the hardest kind of hard work, as the De Laval organization has no time for anything else.

Please let applications state the full name, age, and address of the applicant; salary at present earned and salary expected; character of present employment and with whom; previous experience in creamery or dairy work; Experiment Station or Dairy School practice, if any; experience as a salesman, if any, and degree of success achieved; together with such general qualifications as may suggest themselves to the applicant, including references offered. Also whether the applicant may expect to be in New York or Chicago in some other connection before December 1st.

It is naturally desirable, of course, that the applicant possess a practical knowledge of separators. This is necessarily the case in the selection of representatives for creamery or power machine work. It is not imperative in dairy machine representation, however, where the applicant may have had experience in the handling or sale of agricultural machinery, or the establishing of agencies for same.

Please let any letter of application relate to such subject only, that it may be separately filed for consideration in this respect alone.

The De Laval Separator Company,

WESTERN OFFICES: Randolph & Canal Sts., CHICAGO.
GENERAL OFFICES: 74 Cortlandt Street, NEW YORK.
BRANCH OFFICES: 1102 Arch Street, PHILADELPHIA.

READING NOTICES.

All Reading Notices under this head are at the rate of 25 cents per line.

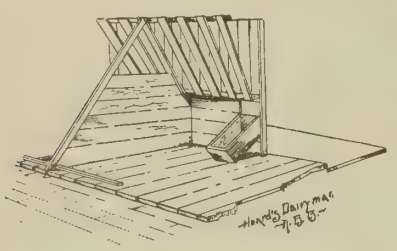
Excursion Tickets to Fall Festivities at Chicago, Via the North-Western Line, will be sold at reduced rates, from all stations, October 2 to 12, inclusive, limited to October 14. Apply to agents Chicago & North-Western R'y. 32-3

Non-Territorial Expansion means paying rent for a poor farm. Now is the time to secure a good farm on the line of the Chicago, Milwaukee & St. Paul Railway in Marinette County, Wisconsin, where the crops are of the best, work plenty, fine markets, excellent climate, pure soft water, land sold cheap and on long time. Why rent a farm when you can buy one for less than you pay for rent? Address C. E. ROLLINS, Land Agent, 161 La Salle St., Chicago, Ill. 32-3



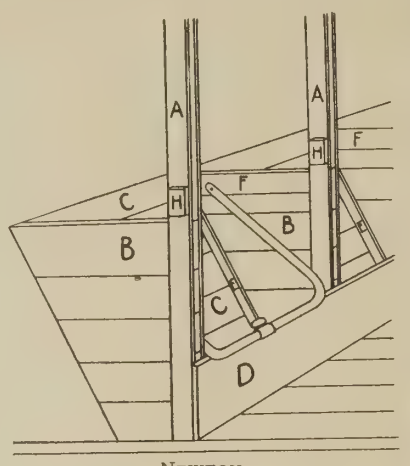
COW TIES AND STALLS.

In answer to repeated inquiries as to which is the best stall and tie for cows, we give herewith illustrations and short descriptions of some that have proven themselves satisfactory and popular. It is asking too much to expect us to pronounce final judgment as to which is the best or to express any preference. There are "many men of many minds" and it does not follow that because we use or prefer one style of stall or tie that our next door neighbor would come to the same conclusion. The illustrations show the features peculiar to each and would seem to be sufficient to enable any one to select something that will please him. Each has some merit peculiar to itself and all are decided improvements over the rigid stanchion.

Some of them have patented devices and the right to use them must be obtained. Several are made at factories and sold outright. Others must be made on the premises or elsewhere to order. The matter which follows does not contain any concealed advertisements but it is but fair to ourselves and to all concerned to say that several of the devices are advertised in our columns and other things being equal we would be gratified to have our readers patronize these parties, and in writing to them mention the fact that their advertisements were read in HOARD'S DAIRYMAN. Advertisers are anxious to know what papers bring them inquiries and sales, and the paper is anxious that advertisers should know that the money they spend brings them satisfactory returns.

It will be noticed that some of the devices illustrated do not show partitions between adjoining cows. We believe partitions are an important and much neglected feature and should be adopted in every stable, regardless of the manner of fastening or restraining the animals. The danger of cows stepping on one another and especially of injuring teats and udders is altogether too possible to be safely ignored and to go into a stable and find a cow standing with another on either side lying down suggests that the standing cow is not as comfortable as she would like to be. And comfort is a condition precedent to profit.

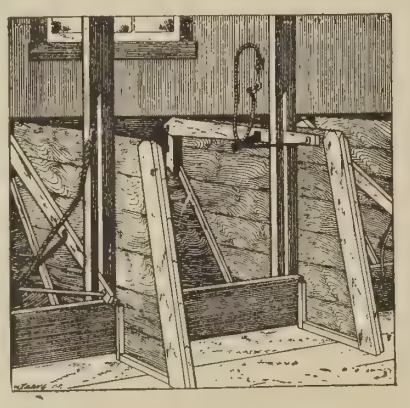
Our first illustration is of the so-called Model Stall, and shows a single stall with one side entirely removed. It may be as narrow



MODEL.

as one pleases, but the width and length should be proportioned to the size of the occupant. We do not consider three and one-half feet any too much room for the cow of average size. The construction of this stall is such that when standing, the rack in front forces her back a few inches so that all droppings fall well to the rear. The bar across the stall at the rear, should be fastened to the floor just in front of the hind feet when standing with her head to the rack. This bar serves the double purpose of retaining the bedding in place and of encouraging the cow to move forward when about to lie down, bringing her head under the projecting rack. The bottom of this rack should be from thirty-five to forty inches above the floor. A shallow manger may extend across the full width of the stall in place of the slanting box shown in the engraving.

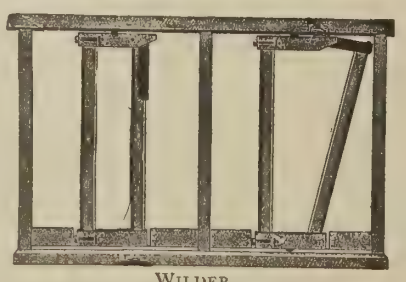
The cow is fastened with a halter about the head—and instead of removing the head piece every time the cow is to be loosened, attach a stout safety snap to the end of the rope and snap this into the ring under the throat, letting the cow wear the head piece all the time.



The two illustrations which follow are intended to promote cleanliness by methods not entirely dissimilar from that employed in the Model Stall. The device employed for this purpose in the Newton tie (E. C. Newton Co., Batavia, Ill.,) is a light, bent,

NEWTON.

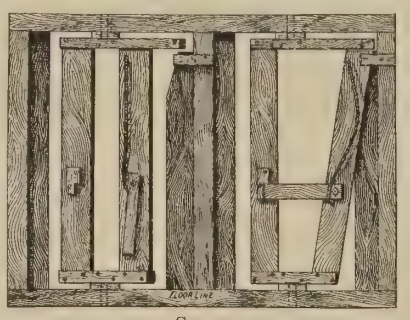
wooden frame, the sides extending to the front of the manger and securely fastened there by bolts at about the height of the cow's throat. In the center of the third side there is a swivel to which the neck chain is fastened. It is very easy to see that this arrangement forces the cow back when standing and compels her to move forward to lie down. It is also equally plain that the cow has the fullest liberty to move her head in any direction.



The Williard Knapp tie (Willard Knapp & Co., Cortland, N. Y.) works upon much the same principle, but employs a different device. In place of the bent rim or bail, a

KNAPP.

single arm extends from the front of the manger to its rear and there passes through a slotted upright. An angle iron is fastened to this arm and the neck chain or rope is firmly attached to it. There is complete freedom of the head, whether standing or lying down, and in the latter position the cow has but little opportunity for becoming soiled with the droppings. The claims made for these ties are that they promote both comfort and cleanliness and do not sacrifice safety.

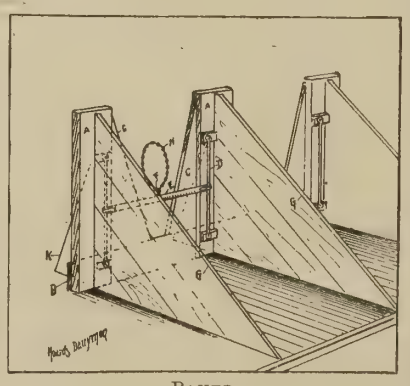


The Wilder Adjustable Swing Stanchion (J. K. Wilder & Sons, Monroe, Mich.) has a patented steel latch which the manufacturers

WILDER.

claim not only insures absolute security but is so constructed and adjusted that when the stanchion is open it cannot be turned out of place. There can be no question that the swinging stanchion obviates most of the objections urged against the old fashioned rigid stanchions. The Wilder form of this class of fastening has the merit of great simplicity, as there are no combinations to get out of order or delicate parts to wear out. The illustration shows the method of construction and operation very completely.

The manufacturer of the Scott Stanchion (B. C. Scott, Bridgeport, Conn.) calls it the Perfect swinging and self-closing cow stanchion. We certainly have no data at hand warranting us to dispute this claim, although it is somewhat contrary to our habit of mind to admit that anything is beyond the possibility of improvement. This stanchion differs from the foregoing principally in the so-called self-closing attachment. The opening of the stanchion to release the cow raises a cross latch which locks the swinging bar back, but when the cow comes in place again and puts her head down to feed, her neck releases this cross-latch and the bar springs back and is automatically locked fast.



SCOTT.

Mr. Scott prints in his circular some comments regarding the effect of confusion and irritating treatment upon the yield of milk which are so truthful and pertiment that we reproduce them here.

The yield of milk is largely increased by avoiding irritating treatment by hurrying hands. Every kick and blow lessens the yield of milk, according to the temperament of the cow. The best milkers are often the most excitable. Fighting and violence also have a bad effect on the milk yield. Large milkers, good stock, fine bred cows, are more susceptible to violence and excitement than rough stock of low value or low milk yield. The "master" cows are not often the best milkers; they enter the stable first when the door is opened, and if not fastened at once they interfere with the peaceable entrance of their betters, and a period of hooking, shouting, kicks and cuffs ensues, just at milking time, with the worst possible influence on the milk yield, and her permanent milk secreting power. Bewildered and abused by man and beast, the cow discounts her present milk yield.

The next illustration is reproduced from HOARD'S DAIRYMAN of June 26, 1896, and is there called the Baker stall and tie, because we were indebted to Mr. A. D. Baker, of New York, for the plan and following description.

BAKER.

A A are two pieces of 2×4, (wider stuff may be used if a wider stall is desired) three feet and eight inches long, fastened to the floor; B is a board, eight inches wide, nailed to uprights, to make back side of manger; C C are two pieces, made by cutting a twelve inch board diagonally, fastened to the edges of the uprights, to hold them rigidly in place and form a V-shaped opening into the manger; D D are two three-eighth inch iron rods, two feet long, with holes through the flattened ends to receive one-quarter inch bolts, and set out one-half inch by blocks; E is a light, tough piece of wood, fastened to D and D, by heavy band iron bent in shape of a long U, with two holes for rivets to fasten same to ends of wooden rod. Instead of this band iron, one may use the irons that go in the heads of harness traces next to the hames, heat, spread and rivet to the rod.

F is a swivel connecting the chain or rope H, that encircles the cow's neck, with a ring on the rod E. G G are the partitions running back from the uprights A A as shown, bracing them and separating the cows so that they cannot injure each other's teats or udders.

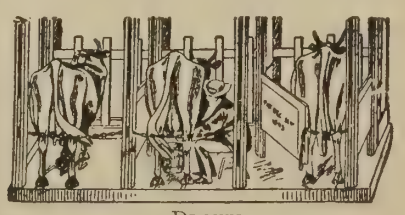
The floor can be made any length required. I use two thickness of inch boards, instead of two inch plank, and lay them so as to break joints, thus preventing any leakage of liquids.

There is no patent on this tie or stall, and if any one cannot understand how to build and use from the foregoing directions, I will try to explain further.

(We have taken the liberty to add to Mr. Baker's sketch and directions the piece K in front of the uprights, to still further brace them, and to prevent cows from stealing hay or grain from each other. This piece should be made like the pieces C C, by ripping a twelve inch board or plank diagonally, from corner to corner.

The dotted lines in the cut represent the parts which are supposed to be hidden from view by the partitions.)

The stalls which follow are in effect pens. The cow is not tied or fastened by the head, but once in her allotted quarters, is kept there by a bar or rope or chain running from one side of the stall to the other. This has proved a perfectly safe method of restraining the animal, provided the stall is not wide enough to allow her to turn around.

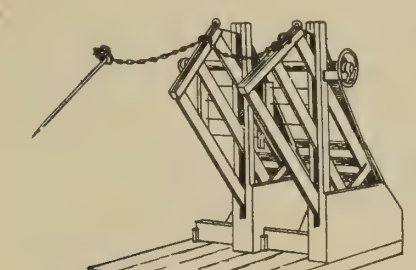


So far as we know, the Bidwell Stall (Porter Bidwell, patentee and manufacturer, McGregor, Iowa,) was the pioneer in this direction, and there are many people using this stall today who claim that the various modifications in the other styles are not improvements. The illustration, although on a greatly reduced scale, shows the general features of construction and the way it is used. There is a rack and manger (adjustable for cows of various sizes) in front,

BIDWELL.

separate for each animal, and a solid partition about half the way back. On the end of this solid partition there is a gate, which swings open to let the cows out, and closes and fastens on the posts in the rear. Whenever it is necessary for an attendant to enter the stall, he opens the gate part way, and by so doing crowds the next cow over, more or less, giving plenty of room for milking, or any other purpose. If necessary, this gate can be fastened back, and whether opened or closed, protects the milker from the feet and tail of the cow at his back.

The Drown Stall, (the Drown Cow Stall Co., Madison, Wis.,) is, in many respects, not essentially different. The details of construction have been varied somewhat, especially by introducing a swinging rack which is intended to give the cow a little

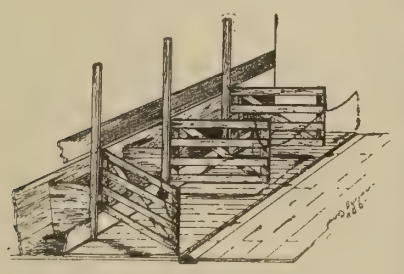


DROWN.

more space for getting up; the partitions are adjusted and operated differently. Parties who have used this stall tell us that they consider them as near perfection as any thing can be made. As we said in the beginning, it is not for us to pronounce on the respective merits of these stalls, or explain in detail the claims of each. If more particular information is wanted, write to the manufacturers.

We can only say that if the experience and conclusions of others afford a just basis for judgment, one's choice cannot lead him astray.

Mr. Charles Thorp, of Dodge county, Wisconsin, is not only a successful farmer, dairyman and institute conductor, but a successful designer and builder of many labor saving devices and conveniences in and about his farm, creamery, stables and other buildings.



The illustration herewith shows a stall which he designed and described in HOARD'S DAIRYMAN about two years ago. As will be observed, he dispenses with the rear posts and instead of having his partitions swing, he raises them up by a roller just over the cow's heads. This roller may be of any length, running across ten or twelve stalls, if necessary, and raising all the partitions at one time. By detaching the rope from one

THORP.

or more partitions, they may be left in place, when the others are raised. He overcomes some of the objections to mangers, by making them removable. Both the front and the rear, instead of being nailed fast, pass in between cleats and may be taken out for cleaning as often as may be desired. The slots in the uprights are two inches wide, and as the gates or partitions are made of inch lumber, there is plenty of play for the rear to swing back and forth as the cow moves, or to admit the milker.

The last in our series of illustrations represents a stall that has not yet received a name. The drawing from which the illustration was made was taken by the artist in the stable of Mr. L. M. Roberts, in Fort Atkinson, and is a very faithful representation of three adjoining stalls, each three and one-half feet wide. The stall on the right has the end of the stable for one of its sides, and a chain runs from that to the first swinging partition, which is made of four four-inch slats, and a brace and ends of similiar material as shown. These partitions are hung to 2×4 posts by common T hinges, so put on that the gates swing either way

with equal liberty. The posts are set with a slight slant to the rear, and as a consequence the gates or partitions, when not fastened back, rest at right angles with the mangers. A board, twelve inches wide, is nailed to the front of these posts, just above the gates, which prevents the cow from rising up so as to get over the manger. The illustration shows these mangers, but they are not a necessary part of the scheme. If one prefers an open feeding place, a bar placed in front answers the purpose of keeping the cow in place. The partitions swing about twelve inches above the floor.

There are other and much more expensive stalls in some stables. Some of them are made of iron, both for durability, and to insure against infection. Some of them, notably those at the Wisconsin Experiment Station barn, embody practically the same principles that appear in the stalls herewith illustrated. Mr. Gurler has iron stalls in his barn, but at present prices for iron it is not to be expected that many farmers will care to indulge in such stalls.

May we not reasonably indulge the hope that these illustrations will suffice to give our readers some useful and timely suggestions on this by no means unimportant subject of cow stalls and ties. We plead with all to respect the rights of patentees and manufacturers. If your choice falls upon one of their devices, do as you would wish to be done by. So far as we know, all these stalls and fastenings are sold at as moderate prices as the cost of labor and material will warrant, and one is sure to get a better product than a novice can turn out. On the contrary, if one prefers to try one of the others, study the situation, measure your cows and use sound judgment in adapting means to ends.

THE dairyman who has a summer silo is right in it; his milk supply is not falling off as is his neighbor's, and the prices of butter and milk are advancing rapidly. How many men are going to take this year's lesson to heart and provide green feed for summer use in the future.

Remedy for Cow Pox.

ED. HOARD'S DAIRYMAN:—Tell F. M. S. to use new soft soap for cow pox; it will surely cure it, and the quickest of anything I have used. It will also cure prairie itch on children. C. B. BOOTH.

Warkworth, Ont.

Frozen Ensilage.

It has been generally supposed that the freezing of the ensilage in winter would injure it for summer feeding. During the past winter, we had occasion to examine ensilage which was stored in a stave silo erected out of doors, with no protection whatever to keep the ensilage from freezing, except that afforded by the staves, which were two inches thick. The ensilage was frozen around the outside of the silo to a depth of about six inches. This ensilage was not fed out until June, and that which had been frozen, kept just as well as that which had not been frozen, and was apparently not injured in the least by the freezing. It thaws out slowly away from the air, and without the presence of oxygen, there is no possible chance for it to decay or spoil. So with the construction of the stave silos, we are led to believe that no protection whatever is needed to keep the ensilage from freezing.

For winter feeding, of course, the ensilage would not be fed while frozen, but each day when the material is thrown from the silo, if that which is frozen is mixed with the warm ensilage from the center of the silo, in a few hours, the whole mass will be in good condition for feeding. The silo should have a place on every dairy farm, and ensilage should be provided for both winter and summer feeding.—L. A. CLINTON, *Rural New-Yorker.*

Good Prices for Pork.

Five-cent hogs are here. The man who predicted this price, is now honored as a prophet. The market has been steadily tending upward, with the inevitable declines that accompany such an advance, until this high figure was reached on Monday for an especially attractive load. This is the highest price paid since August of 1895. The upward movement has been stoutly opposed by buyers and in the face of sluggish provision markets, it has seemed strange that they have not been able to exert more influence. The explanation lies in the great growth of the trade in fresh pork. Mechanics are more generally employed than for years past and wages are steadily rising, so that consumption of fresh meats has been materially augmented the past few months. Moreover, another factor in the problem is the improvement in refrigerating facilities and the consequent expansion of the trade in fresh pork. The demand from the South for the salted meats, long in favor there, is remarkably small and this, doubtless, affects the provision market unfavorably, but shipments of fresh pork more than compensate for the loss in the demand for salted products. Whether hogs can remain at their present prices if the huge promised corn crop safely matures, is a question, but if they do, the farmer will, more than ever, have occasion to be grateful to the hog as the mortgage lifter.—*Breeder's Gazette.*

The World Cannot Show Its Equal

In STYLE, CONVENIENCE and DURABILITY.

Body hangs but 17 inches from ground, and turns can be made in its own length. Sold direct to Dairyman at bed rock prices. For description and price address,

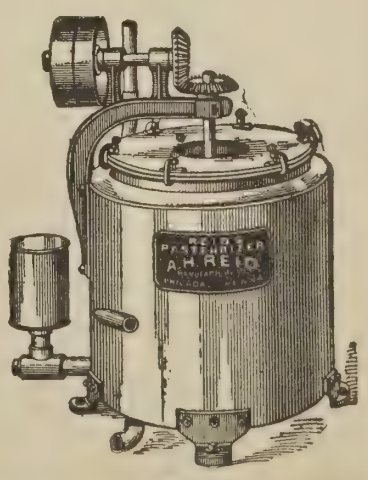
The REID LONG SPINDLE Separator

STANDS EVERY TEST.

The Reid Long Spindle Separator has been subjected to every possible test, under all conditions, and the results have proven that, for rapid and close skimming, for ease of regulation and economy of operation, it is as nearly scientifically and mechanically perfect as a separator can be.

Read This Statement

from an experienced and well-known New York Creameryman:



RED HOOK, New York, July 29th, 1899.

I have just completed a test of the machinery in the Medusa Creamery, under the supervision of a person competent to do this work with the following results, which I must frankly say, are entirely satisfactory:

When skimming 2,715 lbs. of milk per hour at a temperature of 85 degrees, making 32½ per cent cream, the skim milk showed a loss of .02 of 1 per cent.

When skimming 2,805 lbs. of milk per hour at a temperature of 156 degrees, making 32½ per cent cream, the skim milk showed a loss of .01 of 1 per cent.

We feel confident that the Reid Separator will skim 3,000 lbs. or more per hour and do equally as good work. D. W. WILBUR, (Medusa Creamery Co.)

The Suspicions and Prejudices of Creamery Patrons.

[By G. W. PRIEST, of Meriden, read before the Farmers' Institute, Meriden, Kansas.]

Ever since man commenced to do business, the man in business has been reproached and maligned by the man out of business, and with whom he does business, either through jealously, suspicion or prejudice.

Ever since man commenced to sell the products of his farm by weight or measure, this everlasting howl of somebody trying to beat and cheat him has been in the air.

The business man under suspicion may be the best friend he has on earth, and would rather give him a dollar than cheat him out of a nickle, yet the fact that he buys cattle and hogs, or corn and wheat, or sells sugar and coffee, makes him a suspicious character in the eyes of a great many people who sell him their products, or from him buy their supplies.

Exchange places and put the farmer in the store and the merchant on the farm, and in the eyes of these same people their characters change at the same time. The merchant as a farmer will, of course, become honest, and the farmer as a merchant will forthwith go to cheating his neighbor farmers.

Now, while this is true, generally speaking of the man in business and the men who do business with him, some kinds of business are much more subject to suspicions than others, and never since the days of Adam has there been a business around which clusters so many suspicions and prejudices as the creamery business of today. This is partly accounted for from the fact that creameries do business on a different principle than any other business institution. It is the only business institution on earth that buys your goods without telling you what it will give you for them.

Suppose I go to my neighbor to buy his fat cattle and hogs. I tell him I will buy his stuff, and ship it, and after paying the expense of shipping, I will take out my profit and give him all the balance. He would probably want to know how much profit I would want, but of course that would be none of his business.

He shouldn't let such small things as that trouble him, for I surely would take enough. I take my eggs to the store and ask the merchant what he will pay for eggs. He says, "I don't know, but I will take your eggs and handle them, and after paying the expense of handling them, and a profit for me I will give you the balance." Now how many cattle and hogs do you think I could buy, and how many eggs do you suppose that merchant would get? And yet that is the very principle upon which creameries do business. They say: Bring us your milk. We will make butter out of it. We will sell the butter and after taking out all the expense of making and handling it, and a profit for us we will give you the balance. How magnanimous!

Now the patron don't know whether those profits mean one per cent a month or ten per cent a month on the money invested in business, or whether it will amount to $100 a month or $1,000 a month. He does and can know nothing about it. He has no way to protect himself.

The old maxim: "It takes two to make a bargain" is not in it. It is a clear case of one making a bargain. But while this is true of the creamery and its business, the imaginations and suspicions of the patron are something wonderful. And they will continue and increase, and grow worse until creameries commence doing business on a principle alike equitable to themselves and their patrons.

The Babcock machine, the creamery scales, and the men who run those machines, come in for the most of the calumnies.

Your cows don't give as much milk to-day as yesterday and, of course, the milk-weigher cheated you. To-morrow your milk weighs more than it ever did without any apparent difference in cows or pasture, which, of course, is all right. The next day it don't weigh so much and you are cheated again, and so on until the end of the month, the milk-weigher being responsible for all the shortage in your weights. You forget that cows are fickle and don't give the same amount of milk each day.

Take two cows on same feed, running together in same pasture and exactly the same care; one will give less milk to-day than yesterday and the other more. To-morrow or next day on same conditions, perhaps that will be changed to exactly the opposite in milk yield. Now what causes it? Why will cows be so fickle? I think they do that to give their owner a good chance to cuss the creamery, especially the weigher.

I try to reason with you— I tell you that milk-weigher is not a bad fellow—never was known to do anything very bad and certainly would have no interest in trying to beat you and I. But you say to me that John Smith, or some other one of the directors or the manager or owner could easily fix him. He could give him five dollars a month extra to take something off of each man's milk. Now let us figure a little. The creamery here at Meriden has about two hundred patrons—then that milk-weigher would have to cheat two hundred different people each and every day. There are thirty days in the month. Thirty times two hundred would be six thousand—Holy Moses! What a thief ! ! Steal six thousand times a month and do all that for five dollars. In other words he would have to steal twelve times for a cent. Every one of you in this audience think for a minute and then calmly and honestly think how many men there are in this neighborhood who could be bought to do such a wholesale business of stealing from their neighbors, for somebody else, at the rate of twelve steals for a cent.

Let me tell you that creamery owners don't have to hire somebody to steal for them. After the butter is all sold, and after the first of the month, they figure up the expenses of running. They foot up the amount of their receipts for butter and everything else sold for the preceding month. They substract the expenses from the whole amount of money taken in, and that leaves the profit for the creamery and the pay for the patron's milk.

Now then the creamery company takes out of that pile what they want, or think they dare take, and they divide the balance among us fellows and call it pay for our milk. Now I would like to know what a creamery man would want to steal from us for, in our test or our weight, when he can take all he wants without stealing it.

Then there is the test business—where is the eye that hath not seen and the ear that hath not heard of the iniquities of the Babcock test? It is probably the least understood, and the most abused piece of machinery in the land—but the abuse of the Babcock machine is nothing compared to the abuse showered upon the man who does the testing, or takes or prepares the samples for testing. People can't understand why, under same conditions, so far as they know, and with same cows, their milk should vary four or five points in a month. In some of our large creameries one man does the testing at all the different plants, a man who has no interest in the business, and, of course, no interest in trying to cheat you and I. Yes, but says one, "That man is all right, but the samples are doctored before that man gets them."

Now, who would doctor them? And echo answers "Who!" I have already showed you that the managers and owners of creameries didn't need to do that kind of business, because they could get it easier and without stealing it. The fact is, there are so many things capable of affecting our milk, things that we don't see and can't know, together with our ignorance of the working of the machine, that it is no wonder that we are ofttimes surprised at our test. But the same cause that will make a cow give a quart or two less milk today than yesterday, will probably affect the quality of the milk equally as much as the quantity.

But there is this difference. We can see difference in the quantity when our cows fail to give the usual amount, but we cannot see the difference in the quality and cannot know anything about it, until revealed by the Babcock test.

Scarcity of water—and that means poor, hot, muddy water—extremely hot weather when the cows will stand in the shade and fight flies from nine or ten o'clock in the morning to four or five o'clock in the afternoon—all these will certainly affect the quantity as well as the quality of the milk and hence show a low test. Anything that affects the nervous system of a cow will affect her milk. But creamery companies are frequently to blame for many of these suspicions. They sometimes put a man to weigh in milk whom the patrons have no confidence before he commences his job. They are not always blameless in the selection of a manager and other officers. But the thing that makes the cow man maddest, is for him to find out that little creameries around the big creamery where he sells his milk gave about a cent a pound more for butter fat in May, one-half cent more in June, and one or two cents more for July

than his creamery paid for same months.

In that event you bet he needs a safety valve—he knows the more milk the creamery gets the cheaper they can make the butter. It takes a certain amount of milk to pay running expenses, and after that the more milk they get the more money they make, and the more they can pay for the milk. Now, when a big creamery, getting fifteen to twenty thousand pounds a day pays less than a little creamery getting five or six thousand pounds a day, there is certainly a colored gentleman in the wood pile, and I would not blame a patron of that big creamery if he would call a meeting of his neighbors and devise ways and means to make the atmosphere in the immediate neighborhood of that creamery pretty warm.

How Man Improves Cow's Milk.

A writer in the *Rural New-Yorker* tells of a visit recently made to a laboratory in New York City, in which milk is specially prepared for the use of infants and invalids. The retail price of the improved milk is twenty-five cents per quart. The writer says that no doubt there are thousands of farmers within shipping distance of New York who are glad to obtain ten per cent of this price. But this is "Modified Milk"—modified, manipulated and made over by human skill so that the cow that first gave it to the world would hardly recognize it. The farmer will claim that the old cow knows her business well enough, and that no two-legged milk handler can improve on her product. Some of the doctors and the babies in New York think otherwise, and their desire has led to the great demand for modified or made-over milk. I recently went through the plant of the Walker-Gordon Laboratory and saw how the milk was handled.

It is true that a healthy cow understands her business. The milk she produces was designed by nature to nourish her calf. Man steps in and takes the calf away, and says that the milk is a perfect food for humans. So it is for those whose digestive powers are equal to those of the calf. Children and adults as well are not alike in their ability to digest even so simple a food as milk. The calf itself is brought up on a "modified milk." The cream is taken off, and the skim milk forms the basis for the calf's food. The fat taken in the cream is supplied in the form of linseed meal, egg, boiled oat meal, or even "oleo" oil, until the little thing has a stomach strong enough to dispose of rougher products. The calf is a master at the business of digesting milk. We are glad to take his stomach to make rennet for our cheese making.

Our little human calves, if fond young parents will excuse the expression, vary greatly in their digestive ability. Some of them have a hard struggle for life at best. With some of them the foundations for dyspepsia are laid before they can talk about them. At the Walker-Gordon Laboratory is a chart hung on the wall with the following table:

		Per cent fat.	Milk sugar.	Protein
1	week.	2	5	0.75
2	weeks.	2½	6	1
3	"	3	6	1
4-6	"	3½	6½	1
6-8	"	3½	6½	1½
8-16	"	4	7	1½
16-24	"	4	7	2
24-32	"	4	7	2
32-36	"	4	7	2¼
36-40	"	4	6½	2½
40-44	"	4	5	3
44-48	"	4	4½	3½
48-52	"	4	4½	4

That is the doctor's estimate of the way a child should be fed for the first year of its life. At birth, the child is to be fed a three-per-cent solution of milk sugar in water. This is for the first twenty-four hours. Then for the first week two per cent of fat are added, and a little protein. The milk is changed thereafter as shown in the table. The ration is one ounce per day at the beginning, and nine ounces per day at the end. It is quite evident that they do not expect the child to become very muscular during the first few weeks of his life. The protein is nicely regulated to suit the time when the child would creep or walk.

Human milk varies greatly in composition, and is more susceptible to changes which affect the infant than any other. It is slightly alkaline, while cow's milk is acid. It is probable that some children are but poorly nourished by the milk of their mothers, or that of an ordinary wet nurse. Doctors boldly claim that the "theoretical milk" described in the table and carefully prepared, is better and safer for the child than the ordinary human milk. The business of the Walker-Gordon Laboratory is to mix this milk accurately and distribute it

It costs about $180 per year to feed a child on this theoretical milk. This may seem like a great price to those who may be said to feed a child on odds and ends; yet there are plenty of people in the great cities who consider this a small price to pay for a little human life.

How is the milk modified? They start with the skim milk from which the fat has all been removed. There is no way of extracting the protein or muscle-makers from the milk. There is no way either of adding to the proportion of protein except by slowly evaporating the skim milk. The protein in milk is the most soluble form of that substance—more digestible than the white of an egg or beef tea. Nothing can be added to take its place. In some forms of kidney disease a special form of milk rich in protein is found useful, but about four per cent is the highest ordinarily required. Of course, milk sugar can be added by dissolving it in water and pouring it into the milk.

The methods of modifying the milk are very simple, yet effective. A number of large glass jars, which we may call auxiliary cows, are hung on a stout frame. At the lower end of each of these glass cows is a rubber tube, which may be "milked" about like the rubber "teat" on a Small's calf feeder. These glass cows vary much more in the quality of their yield than Jersey and Holstein cows. One contains skim milk, another distilled water, another pure cream of standard strength, another a definite solution of milk sugar, and another lime water.

Milking these glass cows is a simple operation. The milk is handled in glass tubes, or bottles, which are accurately graded or marked. Suppose the child is nine months old. A certain marked quantity is put in the bottle, then enough of the sugared water to fill up to another mark is milked in, and so on with cream, lime water or distilled water, until the limit is reached. Then the tube is filled with absorbent cotton, and put, with others, in a wicker basket, which is put into cold water, awaiting delivery to the customer.

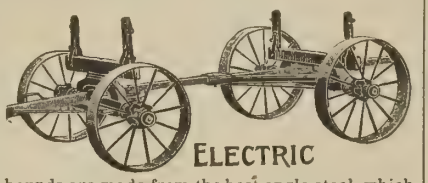
Smothering Weeds in Waste Places.

There is an old saw which says that "Satan finds some mischief still for idle hands to do." This principle has its counterpart in the vegetable kingdom, and there is no doubt weeds are largely spread through the agency of waste lands. We do not mean by this the prairie lands which have never yet been broken. These are engaged in grass growing and are comparatively innocent in the matter of weed propagation. Patches of land which have been broken, or where for some other reason the sod has been killed and then left vacant, are the offenders. Nature abhors a vacuum, and such places soon become active breeding places for weeds. Any observer will notice that a large number of these are to be found around most of our towns, along the roadways, and on a good many farms, and the spreading of seed from these patches must be great. The writer has now in his mind a town where a patch of Canada thistles has secured a footing, and which, despite the request of one or more farmers, has been left almost alone—and this, too, in a district where this plot of thistles is almost, if not the only one.

In the Manitoba Noxious Weeds Bulletin, Rev. W. A. Burnham offers the following very sensible observations and suggestions in regard to this matter:

"There are many instances on record of low-growing, tender plants being used to choke out plants which seemed to defy destruction in other ways. * * *

From observations made during the past few years in the province, the writer is persuaded the same principle may be applied to our roads, railway grades and waste places in both town and country.



"The plant suggested for this purpose is the common white or Dutch clover. It is possessed of great vitality, grows easily from seed, is proof against our severest frosts, spreads rapidly and is very persistent in its growth. As an illustration of what it may accomplish may be noted certain streets in Winnipeg and West Selkirk, where it has killed out every weed. From the latter town it has been carried along the ditches to the Red river, in the lower reaches of which it has in many places asserted itself above all other vegetation on the river bank.

"The suggestion is therefore made that municipalities, railway corporations and individuals be encouraged to make trials of this new method of fighting weeds in places where cultivation is impossible. A few dollars spent in seed scattered along roads, railway grades, or waste places, would, I am convinced, soon lead to a wonderful reduction in the annual cost of destroying weeds. It would have the further advantage of providing pasturage upon land now worse than useless, of binding the surface of grades, and of blotting out patches of unsightly weeds which are such eyesores in our towns."

Action has been taken, we believe, in a few places to follow this suggestion, but still it has not been taken hold of generally. As to the hardiness of the plant, the writer can say that he has seen it growing in all sorts of places from the Red river to the Rocky Mountains. Its smothering habits are well known, and there are thousands of spots in Manitoba and the Northwest Territores which raised weeds this year, to which this suggestion would apply.—*Northwest Farmer.*

BUY THE BEST.

If you want the best low down wagon you should buy the Electric Handy Wagon. It is the best because it is made of the best material; the best broad tired Electric Wheels; best seasoned white hickory axles; all other wood parts of the best seasoned white oak. The front and rear

ELECTRIC

hounds are made from the best angle steel, which is neater, stronger, and in every way better than wood. Well painted in red and varnished. Extra length of reach and extra long standards supplied without additional cost when requested. This wagon is guaranteed to carry 4000 lbs, anywhere. Write the Electric Wheel Co., Box 130, Quincy, Illinois, for their new catalogue which fully describes this wagon, their famous Electric Wheels and Electric Feed Cookers.

Cow Hopple

For Kicking Cows.

Either from habit or from sore teats. **Price 50c.**

Also have a **Wart Cure** that will remove warts from horses, cows' teats or man. **Price 25 and 50c.** The goods are warranted. Sent Postage Paid. Send postal card for circulars

DE KOL'S BUTTER BOY No. 19210. Son of the great DeKol, and Royal Paul No, 22979. Combining the blood of Pauline Paul, Pietertje 2nd, Koningen Van Friesland 5th and DeKol in one sire, head our choice herd of over 100 Holsteins. Sons ready for service, and heavy milking cows bred to them, for sale. Write now to **Dellhurst Farms,** Mentor, O.

SHADY NOOK HERD Holstein-Friesians Choice Chester-White Pigs 2 to 3 months old, both sexes, for sale. W. R. GATES, Ripley, Jefferson Co., Wis.

McGEOCH FARM Holstein-Friesians. Herd headed by Gem Pietertje Hengerveld Paul De Kol and Johanna Paul Colantha. A few young bulls, 5 to 7 months old for sale at bargain prices. H. B. DAGGET, Mgr., Lake Mills, Wis

HOLSTEIN CATTLE! The Choicest Milk and Butter Breed in the World. Write to Wis. Live Stock Ass'n, Appleton, Wis., U.S.A.

OAK GROVE HERD H-F. Cattle. Cows, Heifers and Bull Calves For Sale. C. H. Stevens, Jefferson, Wis.

High Test I offer the grand young bull Prince Mercedes DeKol, whose 4 nearest tested relatives have an average equivalent record of 24½ lbs. and 4.14% fat, and have won 1st, 2d, and two 3d prizes in H.-F. Offic'l Prize Contests. Others extra good. MALCOLM H. GARDNER, Darien, Wis.

HOLSTEIN-FRIESIAN CATTLE Owned by **JONES & RANDALL, Hustisford, Wis.** 100 head to select from. From families rich in butter fat. Herd now headed by Barron Paulina De Kol. Stock for sale. Prices reasonable.

HOME FARM HERD. Headed by Jewel of Home Farm, Sweepstakes Holstein-Friesian Bull Trans-Mississippi Exposition Omaha, Neb. Seventy-five head to select from. W. B. BARNEY & CO., Hampton, Iowa.

MEADOW LAWN HERD Holstein-Friesians. Herd headed by Sir Brookside De Kol. Choice young stock for sale. Come and see them. C. W. HARRISON, Ringwood, McHenry Co., Ill

DE KOL 2nd Is the world's four-year-old, and greatest officially tested butter cow in Holstein history, Her record a four years old is 33 lbs. 6 oz. butter in 7 days; at 11 years, 26 lbs. 9 oz. in 7 days, official test. De Kol 2d won the Register Butter Cup, valued at $200. Valley Mead Farm is in a position to give the blood of this unrivaled butter cow, through her greatest and only son in the west, called De Kol 2d's Alban. His daughter holds the world's official test for one day in America, viz., 4 83 lbs. FOR SALE—Young bulls, grandsons of De Kol 2d. Valley Mead Farm, Monticello, Wis.

Markham Manor Farms. Simonsville P. O., Andover, Vt. Holstein-Friesian cattle bred from the most fashionable butter families, individually large producers, and of the most approved show form The herd contains seven daughters of Sir Nether land Soldene Clothilde, No. 18390, H. F. H. B the most remarkable show bull of recent years. Also large English Berkshire Swine from noted prize winning and imported stock. Write for description and prices to **J. A. THORNTON, Mgr., Simonsville, Vt.**

Comments and Queries from Robinswood Farm.

Limitations to the Usefulness of the Silo.—Mixed Ensilage.—Microbic Causation of Scours and Milk Fever and Preventive Treatment.—Skim Milk and its Best Disposition.

ED. HOARD'S DAIRYMAN:—The season for filling the silo has come again. We have a good corn crop to help out the deficient hay crop. Last fall we top-dressed an old sod with one ton of hard wood ashes to the acre. During the winter we hauled on ten cords of manure to the acre. At planting time we drilled in three hundred pounds of superphosphate to the acre, along with the seed. This land was run down, not having been cultivated within the memory of any one on the farm—only hay taken off of it continually for forty years at least. It had got down to about a quarter ton production to the acre, and held at that.

What the yield of this crop will be I cannot tell, but it is a heavy crop; there are from four to eight stalks to the hill, and most all heavily eared. Probably there will be as great a weight of ears as of stover. This will make rich silage, sufficiently concentrated so far as carbohydrates are concerned. If it shall prove practical to silo soja beans with corn and thus store a balanced food for convenient feeding, it will be a great thing.

But I find advice coming from some of the stations that this is not good practice. Why is this? Does the soja bean make good hay? To pull, stack and thresh the soja plant and grind the beans means much expense, as well as a loss of unrelishable bean straw. In some localities this bean will not mature. Will some one give the reasons for not siloing soja beans with corn?

It is a question whether the small farmer, working single handed, should silo his corn crop. He is out interest on cost of the silo, repairs and cash outlay for help in putting in the crop. With northern grown corn there is little loss in feeding the fine stalked stover, and the cattle relish cob meal. I feel sure that well cured and stored fine stover and cob meal would prove a more healthful food than ensilage. If a man only grows a small corn crop, and has the time to put into husking and the other work incident to the dry harvesting and feeding the crop, it does not seem worth while to put in a silo. But if a farmer is going into the business for all it is worth, I do not see how he can afford not to have a silo for at least a part of his crop, as a matter of furnishing variety in feed, as well as of convenient handling in harvesting and feeding the crop, if for no other reason.

The important thing is to grow lots of corn, and to grow protein crops to balance the feed with, it if possible. It is the practice of some of our farmers to pull off some of the ears from the ensilage corn, allowing it to lie on the ground until convenient to collect and husk it and using the husks for bedding. What is the general opinion as to the economy of this practice? Of course the dry cob meal gives variety to the feed. Do the advantages of the practice overbalance the cost?

Have any decisive experiments been made to demonstrate the relative amounts of digestible nutrition in a large variety of corn, like Leaming, in comparison with a smaller early maturing and more condensed variety, which matures readily in these northern districts? I am going on the theory that by growing the latter variety, we get as much nourishment to the acre, and do not have to handle as much water and woody fibre in harvesting, exercise greater economy in storage room, and are able to put a more concentrated food into the cow. If I am wrong in this idea, I would be glad to know of it.

This drouthy season goes far to confirm the opinion that the dairymen should not place over much dependence on his pastures, for the nourishing of his cows. Consider the pastures as highly valuable for exercising grounds; if they hold out for feed, well and good, but no one ought to place entire dependence on them. In the future, I shall endeavor to keep a full supply of forage on hand for summer feed. With us, I imagine the dried grasses and legumes will prove the most practical source of food for this purpose. On easily cultivatible lands, the siloed corn crop stands easily first for this purpose.

I am experimenting a little with broad leaf rape, as a late soiling crop, but can see that it cannot compare with corn in economy of production and cost of feeding. Does rape give milk an objectionable flavor? If not, a moderate use of it for variety's sake might be well. It certainly produces an abundant crop at a season when the labor for its feeding is available, and the grass crop deficient.

It would be well if some of the experiment stations should definitely determine the cash value of concentrated protein balancing feed, and of concentrates in general in comparison with balanced roughage crops. I may be wrong in concluding that the butter farmer cannot afford to buy concentrates, either to balance his feed or to increase his product, and if I am wrong I should like to have it shown. But when I refer to my last winter's experience and look over the experiment station tabulations, see the sum total of the cost of butter production per pound, note the amount of concentrates fed to get the large production, and figure the amounts of digestible nourishment in both the concentrates and in the roughage, I cannot help believing that there is loss in feeding boughten concentrates.

If a farmer produces them himself and feeds them, that may be a good market for them. I am not sure but that if a farmer is buying fertility for his farm, it may pay him to buy cotton seed meal at even $25 per ton; but it would seem much cheaper to buy potash and phosphoric acid in excess and grow nitrogen collecting feeds. The nourishment in clover hay can be produced very much more cheaply than that in cotton seed meal bought in our locality, and in its production, exercise a much more profitable influencing effect in fertilizing the farm, even if it is not so condensed a protein feed.

We have had our first death from scours. The calf was dropped while no one was present, and had a good time sucking before it was taken away. It died the second day, and acted and died as if it had an overwhelming dose of ptomaine poison, which (apparently) paralyzed its nerve centers, and which was followed by so profuse a diarrhœa that it was quickly carried off. The mother was a strong healthy cow, and the calf was apparently strong and healthy for several hours after birth. Its sire was the same as served all the herd and a thoroughbred Jersey. The next cow that calved was milked just before it dropped its calf, and there was no scours in that case.

If the first calf did not die from the poison generated in the milk of the dam by bacteria, what was the cause of its death? Certainly not from over feeding in this case. Did it die from bacteria poisoning generated in the uterus of the dam? It does not look that way. It is safe to believe that a specific germ may be a principal cause of abortion in cows, just as the germ of syphilis is the most frequent cause of abortion in the human female. But it is reasonable to believe that milk poisoned by bacteria in the milk ducts of the dam is a prominent cause of fatal scours in the calf; that general systemic poisoning by bacterial ptomaines is the cause of death from so-called milk fever in the cow.

This hypothesis is corroborated by certain facts. While the calf is growing in the uterus, a large amount of nervous energy and blood supply is directed to that organ. Coincidently with the function of reproduction, the nerve centers are also undergoing an increase in development and power of function. But when the calf and placenta are cast out of the uterus and that organ undergoes involution, the highly developed and active nerve centers, which are also directly connected by large nerve trunks with the udder and send out their influence, it goes largely to the udder.

This is followed by a largely increased flow of blood to the udder; and before much milk can be formed or drawn away by the calf or by man, admirable conditions are furnished for the growth of bacteria in the milk ducts and glandular tissue, and for the general systemic absorption of the poisonous products of such bacterial growth.

If this theory is correct, it would seem to be good practice to milk the cow before calving, so as to get out as much of the bac-

teria and their poisonous products from the udder as may be possible. I have given orders to adopt this practice in my herd and not to give the colostrum to the calf. I see no reason why it would not be safer to give the new born calf milk from some other cow than that of its dam, and if practical, it would be better to allow the calf to suck a foster mother. Even with the best of care, hand feeding puts more bacteria into the calf than it would be likely to get in sucking. Do cows that do not go dry have milk fever?

Hand feeding of calves does not seem a very rational proceeding in this day of low cost butter fat. If veal is the object, more of it can be got if the milk is drawn directly from the udder by the calf, while if the calf is to be raised for milking purposes, it gets a better start in life if it has whole milk for a time at least. From a theoretical point of view it does not seem good practice to feed such an embyro cow skim milk. From the point of view of the breeder who does not care a rap what the history of the animal is after he pockets its selling price, and who seeks early maturity, this is a fine practice, but for the farmer who wants to keep a cow through many years of milk production, an early maturity that is secured at the cost of an undeveloped alimentary tract, is a delusion and a snare.

Concentrated and easily digestible food will make a fine, quick growth on the young animal, but an animal that has got to digest a large amount of crude, bulky fodder during its working life, to be a profit to its owner, ought to be given bulky food very early in life, and not too easily digestible. If we were working for two-year-old beef it would be a different matter.

Of course, a properly balanced ration is of vast importance in securing the correct development of the young heifer, and a narrow ration, rich in protein, is desirable, but where practical it would seem better to have the protein fed in a less concentrated form than in skim milk, though if bulkiness in the ration is secured by the carbohydrates, the feeding of skim milk is an economy, if not the best practice.

What do the authorities say in this matter? Enough protein to secure a milk producing tendency is desired, but more than enough is wasteful, as protein is too expensive a food to generate heat and energy. The good milk cow—the cow that will live many years of profitable existence, has not only got to have an inbred tendency to produce milk through an evolved milk forming apparatus, but it has also got to have a highly developed digestive apparatus as a preliminary condition.

What is the best disposition to make of skim milk, especially taking into consideration the difficulty of securing it from the separator station in a sufficiently unchanged condition? The hog is usually the most convenient means of utilizing it, but it would seem that when pork is bringing only five cents a pound, while butter is bringing from fifteen to twenty cents per pound, it would be better to feed it to the cow and help balance the ration, especially as protein foods are so expensive to raise or to purchase. Cannot the DAIRYMAN bring more experience in this line to light? Is it difficult to get the cows to drink ordinary separated milk? Would it be well to sterilize the skim milk at the creamery with perhaps a preliminary addition of lime water or soda, to neutralize acids formed and prevent coagulation? The method of coagulating with rennet or mixing the cheesy matter with other matters seems quite a bother.

Perhaps it would be well to quickly and thoroughly ferment it with yeast and turn the milk sugar into alcohol and thus secure a comparatively harmless form of preserved milk. The loss of carbohydrates would not amount to much, and fermented milk in the form of Koumyss or other named medicinal preparations is a very digestible form of nutriment for invalids. Why not for cows,—especially for mature cows and for those past their digestable prime?

Alcohol is a mighty dangerous and unbalanced food for human beings and in health always does some physical harm, but it would lose its dangers when fed to a creature which would not know how to make it and has no money to buy it. Possibly some of the chemical preservatives which merely coagulate and harden the protoplasm of bacteria and of the milk, and which thus render it difficult of digestion for infants and other human beings, might not prove objectionable in the case of milk cows. Why should not the experiment stations investigate the value of skim milk when fed to cows and devise a practical method of doing so?

J. M. W. KITCHEN, M. D.

New Hampshire.

Notes on the Proper Handling of Barnyard Manure.

In those portions of the manure which are accessible to the air one class of bacteria live and breed in enormous numbers. They feed on the oxygen of the air and the nitrogenous portion of the manure and in their excrements give off large quantities of nitrates, the latter being the direct products of the oxidation of nitrogenous organic matter anywhere, whether in the bodies of these bacteria or not. These nitrates, being very soluble in water, drain down into the interior of the manure heap, just as they drain through the soil. But instead of all going off in the drainage water and becoming lost, as they often do in the soil, they are chiefly lost by an entirely different process.

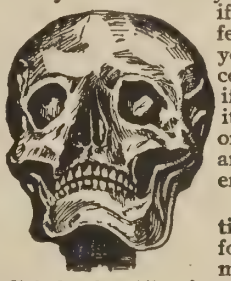
In the interior of the heap, shut away from the air, these nitrates fall prey to another class of bacteria known as "nitrate destroyers." They completely undo the work of the other bacteria, or "nitrate formers." The "nitrate destroyers" live on the non-nitrogenous constituents of the straw and leaves and the oxygen of the nitrates. This liberates the nitrogen in the form of gas, which escapes into the air and is lost to the farmer. The process also consumes the nitrogenous portion, which is chiefly the remainder of the litter. It is formed into water and carbonic acid gas, which escape into the air and thus diminish the bulk of the pile. While the "nitrate formers" live near the surface of the manure and require air for their work, the "nitrate destroyers" live from the air and do not need it. They are dependent, however, on food of a certain kind and must have plenty of it, otherwise they become inactive and can do no damage, though millions of them may exist in the interior of the manure pile. One of their principal foods, the non-nitrogenous material of the litter, they cannot use as food until it has been made soluble by a third class of bacteria, which causes the rotting of the litter. Nitrates are also indispensable for their nourishment. If, therefore, they are deprived of either one of these constituents of their diet, they either die or at least become harmless.

The work of the "nitrate formers" is beneficial. It converts organic nitrogen into nitrate, a most available form of plant food. Half rotted manure contains nitrogen largely in this form. The work of "nitrate destroyers" is destructive. It removes the soluble nitrates from the manure. It converts half rotted manure into well rotted manure. In this way the different effects produced by manure in its three different conditions are explained. The nitrogen in fresh manure is largely organic and not immediately available It therefore has a slower and less effect than half rotted manure. The nitrogen in half rotted manure is largely in the form of nitrates, and this is available. The nitrogen in well rotted manure has all been converted into nitrate also and was once available, but has subsequently been lost in the air. This is why the well rotted condition is the least valuable of the three.

In handling manure, the farmer should strive to place it at the disposition of the growing crop just at that moment when the most nitrate has been formed and before any has been destroyed. The most favorable conditions are obtained when fresh manure is packed as tightly as possible away from the air and kept in that condition till half rotted and then plowed under just before planting or sowing. Under these circumstances, although the third class of bacteria have in the rotting of the litter made soluble food of one kind for the "nitrate destroyers," the latter have been deprived of their other necessary food, the nitrates, for none could be formed in the tightly packed mass, and they have remained harmless. But the heap has become half rotted without them. After the manure is plowed in, the "nitrogen formers," now having plenty of air, rapidly produce nitrates, which are beyond the reach of the destroyers; for by this time all their soluble non-nitrogenous food has been decomposed and has gone into the air, leaving them to die. The growing plants in the meantime absorb the nitrates.

If fresh manure is plowed in directly before seeding, a poor result is obtained, for the nitrates are not formed until after the plants have passed their growing period, and they consequently starve. As might be supposed, winter crops fare better than spring corps with this proceeding. By plowing in fresh manure several months before seeding a much better result is obtained, because the nitrates are on hand and are being formed at the growing period of the crops. Experience has abundantly proved that it is better to plow manure into the soil and allow it to lie there rather than in the pile. Whether it is better to leave manure spread upon the surface of the land, rather than to plow it in or leave it in the pile, depends chiefly on the amount of loss caused by surface drainage.

The foregoing paragraphs are extracted from an article which appears to fill a want—that of inexperienced farmers and practical farmers who have scant time for the literature of their vocation, for a brief, compact and lucid presentation of the manure question. *Bulletin No. 58 of the Hatch (Mass.) Station.*



More Fraud.

The inspectors of the State Dairy and Food Commission, says the Minneapolis (Minn.), *Daily Times*, have placed the wedge that will open one of the biggest frauds in the butter business that has been discovered for years. For some time past the commission men have been receiving suspicious butter from country districts, and the matter was reported to the commission last week. A sample was taken to the commission's chemist, and an analysis showed that it was a very poor "process" butter and that it contained preservatives. The result was that a large number of tubs of the stuff were seized in both Minneapolis and St. Paul.

Later it was discovered that the butter contained a mixture manufactured by a Chicago firm, who claim that with its use the weight of butter can be increased one-third. Circulars to that effect have been freely distributed among the country merchants, and apparently a number of them have invested. Members of the commission state that the merchants have evidently been buying the mixture, and using it with their packing stock. It has been ascertained where a large part of the butter seized came from, and it is the intention of the commission to have warrants issued for the arrest of the shippers, as it is a direct violation of the state food laws to manufacture or sell such butter.

CONSUMPTION.

The germs of consumption are everywhere. You may breathe them in with the air, drink them with water, eat them with your food. They are not dangerous if you are in perfect health but if you have a slight cold, or cough, or if you have inherited weak lungs, or if you are weak and run-down generally—look out!

Once consumption gets a strong foothold it is almost impossible to dislodge it. The time to cure it is at the beginning or before it starts. If you are run-down—build yourself up. Make every tissue so strong and well that consumption germs cannot find a foothold. Fill your body with rich, red blood—build up strong, healthy flesh—put your digestive system in perfect order. Don't drag along half dead. You may be well as well as not. The following letter from Mrs. Jennie Dingman, of Van Buren, Kalkaska Co., Mich., will tell you how to do it. She says: "Before I took

Dr. Pierce's Golden Medical Discovery

I was hardly able to do my work at all; had pain in my left side and back, and had headache all the time. I tried your medicine and it helped me. Last spring I had a bad cough; got so bad I had to be in bed all the time. My husband thought I had consumption. We thought we would try Dr. Pierce's Golden Medical Discovery and before I had taken one bottle the cough stopped and I have since had no signs of its returning."

Official Program of the Farmers' National Congress.

Nineteenth Annual Session, Faneuil Hall, Boston, Mass., Oct. 3-10, 1899.

TUESDAY, OCT. 3RD.

10 A. M.—Congress called to order by the President.
Invocation by Rev. George C. Lorimer, D. D., Tremont Temple, Boston.
Appointment of Committee on Credentials.
Address of Welcome by Hon. Josiah Quincy, Mayor of Boston.
Address of Welcome by His Excellency, Roger Wolcott, Governor of Massachusetts.
Addresses of Welcome by Governors of other New England States, and of New York, are expected.
Address of Welcome in behalf of Boston Chamber of Commerce.
Response by Hon. W. D. Hoard, Fort Atkinson, Wis , President of the Congress.
Response by Hon. J. M. Stahl, Chicago, Ill., Secretary of the Congress.
Response by Hon. W. G. Whitmore, Valley, Neb.
Response by Hon. B. F. Clayton, Indianola, Iowa.
President's Annual Address.
Report of Committee on Credentials.
Recess to 2 p. m.
2 P. M.—Appointment of Committees on Resolutions, Finance, place of holding next meeting, and President's Address.
Address, "The Mission of the Experiment Station, by Dr. Henry H. Goodell, President Massachusetts Agriculture College, Amherst.
Discussion.
Address, "Decline of Farm Lands in the East; Cause and Remedy," by Hon. J. W. Stockwell; Secretary Massachusetts State Board of Agriculture, Boston.
Discussion.
Recess to 8 p. m.
8 P. M.—Introduction of Resolutions.
Address, "Agricultural Progress and Profit," by Hon. Franklin Dye, Secretary New Jersey State Board of Agriculture, Trenton.
Discussion.
Adjournment to 10 a. m. Wednesday.

WEDNESDAY, OCT. 4TH.

10 A. M.—Introduction of Resolutions
Address, "Inventions for Farmers," by Hon. W. B. Powell, Shadeland, Pa.
Discussion.
Address, "The Canadian Department of Agriculture," by Hon. Jas. W. Robertson, Dominion Commissioner of Agriculture, Ottawa.
Discussion.
Recess to 2 p. m.

RAILROAD RATES.

Rate of railroad fares for Delegates and Associate Delegates and friends to and from the Congress, one and one-third. All must procure certificate with every ticket purchased.

A Picnic at Madison.

COLLEGE OF AGRICULTURE.
UNIVERSITY OF WISCONSIN.

MADISON, Wis., Sept. 15, 1899.

DEAR SIR:—Yourself, family and neighbors are invited to attend a *Farmers' Basket Picnic* at the College of Agriculture, University of Wisconsin, Madison, the last week in September.

A one-fare rate will be granted on the Chicago & Northwestern and Chicago, Milwaukee & St. Paul lines for this occasion.

Tickets can be purchased from all points in Wisconsin east, west and south of Madison, Tuesday, September 26th, with return limit of 27th; from all points north and northeast of Madison, as far a LaCrosse, Oshkosh and Ripon on Thursday, September 28th, with return limit of 29th.

The one-fare rate for round trip will be given on all regular trains, and will admit of a one-day lay over if desired.

You are urged to visit the State University and familiarize yourself with the Agricultural College and its work of instruction and experimentation.

Assuring you of a hearty welcome and a busy, instructive day, I am most cordially,

W. A. HENRY,
Dean College of Agriculture.

OBJECTS OF INTEREST.

The new Dairy Barn and Stock Judging Building.
The new Horse Barn and Veterinary Building.
The various breeds of live stock—horses, cows, sheep and swine.
The growing crops.
The Dairy School Building.
The Horticulture-Physics Building, with green houses, laboratories, etc.
The Horticultural Grounds.
Agricultural Hall with chemical and bacteriological laboratories. (At this building visitors will be given a stereopticon exhibition).
Science Hall with its Geological and Biological Museum.
The Machine Shops.
The Armory and Gymnasium.
The great joint Historical-University Library Building.
Professors and assistants will be in attendance to welcome visitors and point out and explain the various objects of interest in the several departments.
Visitors should go by electric car (fare five cents) direct to the University farm and start the tour of inspection from that point.

The Agricultural College, a branch of the State University, is maintained jointly by the U. S. Government and the State of Wisconsin. It embraces:

I. The Experiment Station,
II. The several courses of instruction at the University, and
III. The Farmers' Institutes.

Every progressive Wisconsin farmer should interest himself in his Agricultural College and its work. To do this he should by personal inspection learn what it is, and what it is endeavoring to accomplish.

Vermont Farm Notes.

The Season, Crop Prospect, etc.

ED. HOARD'S DAIRYMAN:—The present season will go on record as one that has been unusually dry over a considerable area of our great country. Its like hardly comes within the remembrance of the oldest inhabitant of New England, in some respects.

Here in Northern Vermont, we have had only one month—July—with an average rainfall; the rest of the season, thus far, the precipitation has been very small, and it will long be remembered as "the dry season."

At this time, September 20th, the crops have been gathered in so they are beyond the effects of drouth or frost, but the greatest present need is water.

Wells and springs have failed in cases unknown before, and many farmers are put to great inconvenience in obtaining water for stock and household purposes. A well or spring that survives this severe ordeal may well be considered a "living fountain," and should be prized accordingly.

Two or three of the supply stations of the well-known Franklin Co. creamery have had to suspend operations for the want of water, and others have to draw it, some from a distance.

Such a time furnishes the best of opportunities for seeking for new sources of water, for if such can be found, they will be of the greatest value on any farm.

A farm that is supplied with living springs, the water of which can be conveyed by force of gravity where wanted, possesses a value that can hardly be computed in dollars and cents. But all are not thus favored, and many farmers either have to go some distance for water, or be at extra expense in getting it to their buildings. There is often much tribulation and discouragement in securing water where artificial means have to be employed for the purpose, and a good deal of watchfulness and care is necessary, that there be no failure from any cause.

The water supply should be carefully looked after before cold weather, as an abundant supply means a good deal in the results from the dairy at any and all seasons of the year.

The crops have been unusually good for so unfavorable a season with the exception of hay, and in many sections this was better than was anticipated in the early part of the season.

Corn was affected to some extent by the continued dry weather, according to location and condition of the soil, but the crop will be of the greatest use in feeding the stock from now on. The amount of corn for fodder now being grown in the Eastern states is increasing from year to year, as its value becomes better known to farmers, and especially dairymen.

The interest in silos and ensilage is steadily increasing and more are being built each year. The large amount of practical information upon this question afforded by the DAIRYMAN should be of the greatest help to farmers interested in this matter, and it may safely be said that much of the present success in this direction is due to its teachings.

Another year's experience in growing and putting the corn crop in the silo, but confirm the belief in the value of this method for

Work for a Farmer's Boy

Thousands of the most noted men began life on the farm. There is no reason why any farmer's boy cannot be successful. A. C. BROSIUS, COCHRANVILLE, PENN.

the purpose. We find it decidedly cheaper and more expeditious to thus care for the crop than to harvest, cure, handle and feed in the old way, and it is worth much more.

This year the field corn, after breaking off a portion of the best ears, was cut into the bottom of the silo, and from appearances shall expect it to become excellent silage for another spring's use.

Those who have plenty of fodder corn, ensilage or other crops suitable to feed may consider themselves fortunate, as there is but little else now to be depended upon, aside from what may be obtained from the mowing fields, and these should not be grazed to any extent for the benefit of future crop.

With the decrease of the milk yield, prices are tending upward and those who have cows coming fresh from now on will find the best of inducement to make the most of their opportunities, as it is probable that dairy products will rule high in prices through the coming winter.

Happy should the man be who has his "dish right side up" especially when it rains.

If the the teachings of experience, observation and the up-to-date agricultural literature are properly heeded, farmers will commence now to prepare for another season's crops, and that too on an extended and liberal scale, for: "The hand of the diligent maketh rich," and, "He who by the plow would thrive must either hold, himself, or drive." E. R. TOWLE.

Franklin Co., Vt.

CONCERNING OUR ADVERTISERS.

The Karlen Co., Monticello, make the following report of their recent sales:

ED. HOARD'S DAIRYMAN:—We below give you a list of this year's customers, who have purchased stock here from January until July:

C. H. Stevens, Jefferson, Wis; W. E. Hund, Fayette, Iowa; F. H. Burke, San Francisco, Cal; Edmund Hang, Detroit, Mich.; Peter Hammen, Beechwood, Wis.; S. J. Ogle, Waldo, Wis.; Rudi Benherd, Monroe, Wis.; J. H. Marshall, Cordova, Ill.; F. E. Moses, Emsley, So. Dak.; O. J. Persons, Monticello, Wis.; O. U. Kellogg, Cortland, N. Y.; Henry Walsh, Sheboygan Falls, Wis.

Over twenty head of young stock left Valley Mead farm to go to the above named breeders and dairymen, at an average of about $100 per head. The outlook for well bred Holstein-Friesians is indeed bright. THE KARLEN CO.

Monticello, Wis.

VETERINARY.

Queries in this department answered by WM. HORNE, M. D. V. S., Janesville, Wis.

COW PHYSIC—Three-fourths to 1¼ pounds Epsom Salts (according to age and size of animals) and two ounces of best ground ginger. Pour over this three pints of boiling water. When at 105° F., give gradually as one dose.

NYMPHOMANIA.

A fine grade Jersey cow, seven years old, comes in heat every three weeks, fails to breed. C. F. P.

Mitchell Co., Kans.

ANSWER.

Get the advertised remedies seen in the DAIRYMAN, or do as recommended above. You need a powerful sexual sedative and lay her off for three to four seasons after the desire is being restrained or stopped.

HARD MILKING.

I have a heifer, coming four years old, has had three calves, whose teats are so small it takes fifteen minutes to get twelve pounds of milk. Would you advise use of milking tubes? J. P. C.

Henvelton, N. Y.

ANSWER.

Yes, an easy milking tube. Above all, a dilating plug.

LUMP ON NECK.

We have a cow that has got a lump on the side of her neck and on the front part of her shoulder, as big as a two gallon bucket. It came in one day. It does not get any smaller or larger. I can't see any break in the hide where there was a bite or bruise and she is getting lame. It has been four days since we noticed it. I have bathed it with liniment, but does no good. D. S.

Maryville, Mo.

ANSWER.

Bathe the parts affected three times a day with very strong oak bark decoction, tea. To two quarts of the so'ution add a pint and a half of acetic acid. Rub in hard and leave it wet. Liniments are not the thing yet. Give a full dose of physic immediately. I believe you need a personal professional examination by a true expert at once. If the swelling remains, paint over with strong tincture of iodine daily, and give 70 grains of iodide of potassa in two ounces of cold water as a small drench.

COW POX.

I would like to ask what can be done for a cow that has cracks on teats which were small at first but have enlarged till one of them is about an inch in diameter. Does not heal by putting on fresh grease, as such things generally do, but grows worse. Would heal soon were it not disturbed by milking.

New Haven, Vt. J. C. W.

ANSWER.

Bad neglected cow pox. Hand milking is out of the question. Yon need, before doctoring, the lighest and best milking tube to be had. Immediate full dose of physic and repeat, if needed, in five days. Wash the teats with Tilden's Bromo Chloralum, one to eight, of cold water. When dry, carefully rub in twice a day, spermaceti ointment, two ozs, and oil of almonds, two ozs, tincture of myrrh, one dram. Be careful of your hands and other cows. No good doctoring while hand milking.

BLOODY MILK.

We have been milking four good, grade cows, ranging from two to five years of age, since spring, when they were fresh. They all appear in excellent condition, have plenty of pasture, part woods, grain, corn and oats ground, salt and water, but for two months or more they have been giving bloody milk. First one would be very bad, then seem to be better, less blood for a day or two, then another would be worse, and so on; so, one cow does not seem to give any better milk than another. One cow, part Jersey, has had blood come in clots from one teat.

Hartford, Mich. SUBSCRIBER'S WIFE.

ANSWER.

Immediate *full* dose of physic and repeat and *repeat* in six days, if needed. Give each morning two drams of bisulphite of soda, up to six doses. There is a general cause, somewhere, perhaps in the pasture; find and remove the cause, for, if you sell your present stock, the fresh ones will soon become affected by the same cause. After the bisulphite of soda, give two, only, drams of nitre, and one dram of acetate of lead, six doses. Bathe udders in cold water. Milk very gently.

WARTS.

What is the cause of two or three of my cows having their teats covered with warts (on an average of one-eighth of an inch long) when six weeks ago they were entirely free from the same? Will you also let me know the best remedy or method of removal of such? C. T. H.

Summit, New Jersey.

ANSWER.

The cause is hereditary from disposition, chiefly contagious, contact with a warty hand, etc. Wash with hottish water and tar soap, thoroughly; when dry, fix a small piece of sponge to end of a pencil-sized stick; dip into butter of antimony, and touch the warts only, and press and rub a little, as being applied; alternate this with nitric acid, apply twice a day; you can't doctor without a good easy milk tube. No cure can be affected and if milked by hand, which no doubt has spread the warts.

VERMINOUS BRONCHITIS.

We have a disease among calves which local veterinarians cannot give name, cause or relief. In a bunch of one hundred head, from one month to six months old, they have all taken it. The calf droops its head and ears, runs at the mouth and nose a frothy substance, a quick, short cough, and on examination after death the wind pipe and lungs are found full of small, white worms, from two to three inches long, about the size of an ordinary silk thread. R. C. A.

Los Angeles Co., Cal.

ANSWER.

Any veterinary surgeon should be able to diagnose your cases. You have clearly verminous bronchitis, termed hoose, husk, sniffs and many other local and peculiar names. This disease is chiefly contracted in the pastutes, from water, from fodder and all other infected food. Immediate change of place. Separate the affected at once. Keep from pasture during dew or wet. Feed liberally upon all kinds of sound roots, all or any of the oil cakes, grain, oats, etc. Mix equal parts of sulphate of iron, gentian and ginger, four ounces of this to all four months' old calves, oil of turpentine, one tablespoonful shaken up in milk or white of an egg, all the salt they will eat. Burn sulphur in a closed place for a while upon a hot shovel or charcoal fire, as much fumes as they can bear for half an hour or so. Steadily watch them.

TICKS.

I find my entire herd of cattle covered with ticks. What will remove them? Do they injure them in any way? M. L. A.

Greenville, S. C.

ANSWER.

Yes, ticks do injure cows in several ways. Pick them off and burn them. This is tedious to some, but certain, especially in a small herd. Wash thoroughly with tar soap and hottish water. When dry, rub in oil of tar, one oz, pyroligneous acid, twelve ozs, fish oil, twenty-four ozs. To be thoroughly shaken each time of applying.

TO PREPARE COWS FOR SERVICE.

I, like W. H. B., in Sept. number, am having trouble in getting my heifers with calf.

The answer to his inquiry was: "Stop bulling until she is prepared for service." Now, this is not clear to me. I wish to know what course to pursue to prepare cows for service. C. J. M.

Niagara Co., N. Y.

ANSWER.

As above, the best thing is one of the advertised remedies: you will read my reasons for so recommending, or half ounce doses of black haw and one dram of gelsemium, each day, when seemingly needed to keep off bulling for two or three seasons, or one dram of false unicorn instead of the gelsemium. The special remedy is best and is safe, if printed directions are followed carefully, and cheaper, certainly.

FALLING OFF IN MILK.

I have a large Holstein cow that is doing things rather strange to me. She milks from fifteen to sixteen and one-half pounds of milk in the morning, and from twenty-one to twenty-four pounds at night; milked at 5:15 a. m. and 5;45 p. m. Dropped her calf August 22nd. I have been feeding alfalfa twice a day and turning all the cows on barley stubble during the day, and keeping in corral during night. The cows have free access to water, night and day. Until the 7th of September she gave from twenty to twenty-two pounds milk, then she dropped to twenty pounds; on the 8th, twenty-one; 9th, nineteen; 10th, seventeen and one-half; 11th, not weighed.

On August 22nd dropped a heifer calf, and on the evening of August 23rd the calf died. From the time the calf was born, it appeared stupid and lazy; would neither suck, nor could I make it take any milk.

Los Angeles Co., Cal. F. M. W.

ANSWER.

Retention of afterbirth of course caused the decomposed matter. It always does when all or a portion of the placenta is retained. As to the milking, it is all right, all cows, or nearly all, are subject to freaks in milking. The pus did indicate death of the fœtus, and was the result as in retention of the placenta as above stated.

NYMPHOMANIA.

Have a three-year-old cow, calved in June, and has been in season almost ever since. What can be done for her? G. V. T.

Palmyra, Mo.

ANSWER.

Do just as recommended above for C. F.P. No other way to do.

Horse Owners! Use GOMBAULT'S Caustic Balsam

A Safe Speedy and Positive Cure

The Safest, Best BLISTER ever used. Takes the place of all liniments for mild or severe action. Removes Bunches or Blemishes from Horses and Cattle. SUPERSEDES ALL CAUTERY OR FIRING. *Impossible to produce scar or blemish.* **Every bottle sold is warranted to give satisfaction Price $1.50 per bottle. SECRETS OF THE CHEESE FACTORY.

Mr. David Haven, proprietor of a cheese factory at Hartford, Mich., is having an "open meeting" with his patrons in which he makes a frank showing of the economies of the factory business by publishing the following communication in the local paper, "*The Day Spring.*" It is such a clear exposition of business from the factory stand point, we are tempted to print it in full as follows:

EDITOR DAY SPRING:—It has often been said by some on our streets that "we are making altogether too much money," that we ought to charge less for making, etc, etc., while others hoping for our welfare ask, "if we are not getting milk enough this year to pay pretty well?" No one but myself knows how well we are doing, hence I beg space to inform any who may desire to know in regard to some of the secrets of the business.

Our commission for making in June, 1899, was one and one-half cents per pound for 11-658 pounds of cheese, or $174.87. Out of this we paid for

Wood	$ 6.50	
Rennet	5.60	
Color	.70	
Sacking	3.85	
Salt and grease	3.15	
Labor	25.00	
Insurance and taxes	2.50	
Boxes	22.70	
Freight and dray	3.67	
Ice and repairs	4.60	
Wear and tear	4.00	
		$ 82.27
Abbott's milk drawing cost	$37.50	
Patrons paid	26.12	
We paid		11.38
Caloin's milk drawing cost	30.00	
Patrons paid	16.43	
We paid		13.50
Pitcher's milk drawing cost	22,50	
Patrons paid	13.24	
We paid		9.26
Total expense		$ 116.48

Deduct this from commission leaves balance of $57.68 for thirty days' work of twelve hours each.

May and June are practically alike in results. July is poorer as we have to pay the same for drawing and get less milk.

For June we received per day an average of 3727 pounds. If all the cans had been full we would have received 6,700 pounds. Of the entire amount received for the month three wagons named above drew an average of 2309 pounds per day, which cost $90.00.

We charge the patrons eight and ten cents per hundred for drawing, according to location. The patrons paid for the month $55.79, we paid $34.21. The smallest amount paid by any patron for the month was eighty cents and he is kicking because we charged him ten cents per hundred. The largest amount paid by any patron is $3.98 and he says no one can afford to draw for less than ten cents.

We have sixty-five patrons in all, 225 cows giving an average of sixteen and one-half pounds each per day. On an average each cow brought in for her owner for June $3.00. Each patron receives on an average $11.72. The smallest amount paid any patron, $5.96; the largest amount paid any patron, $51.15. The largest amount paid any patron, per cow, is $14.54 for two cows or, $7.27 each—ten cows at this rate would bring their owner $72.70 per month.

Average amount of cheese made a day, 365 lbs.—nine cheese, which shrunk in weight thirty-six pounds in curing. Average price of cheese per pound .0831c; amount of cheese made from each pound of fat, 2.78; price paid for each pound of fat after deducting making, 9c, (price of butter at the store for the month 13c) average amount of fat from each 100 pounds of milk, 3.67 pounds; average price per hundred for milk, 69¾c.

The only object we have in writing the above is to show that the most serious question we have to solve is the question of drawing the milk. The number of cows owned by each person are so few, and the milking season at full flow so short, as well as the patrons being so scattered, that the cost of delivering the milk becomes the most serious problem. The patrons ought to have cows enough so that at eight cents a cwt. the milk drawer could make at least $1 a trip and the Cheese Co., not have to pay anything.

DAVIS HAVEN.

Save The Corn Fodder

For years past we have consistently and persistently urged the larger use of the corn plant, pleading that forage as well as grain be saved and utilized upon the farm. That corn-growers are coming to this view of the situation is evident from the greater general interest in the corn forage question, and each year sees more of the crop put in shock form than ever before. A great instrument to this end has been the corn harvester, which leaves the forage in bundles ready for shocking. The saving in actual cost of these machines for the work done may not be great, but many farmers will perform duties through the aid of machinery which they would neglect were it equally economical to employ hand labor. The corn shock, simple as it is, is the ideal form of placing the stalks for the purpose of ridding them of the excess moisture. Standing on end as the stalks do, with a clear space of some size at the base of the shock the air passes in and upward, carrying the excess moisture with it, so that large shocks can be made with little chance for mildew or decay. Corn forage is useful in feeding all farm animals except the pig. For horses, especially colts, growing animals and those not at hard work, there is no better form of forage, for corn leaves are quite free from dust and full of nutrition. Often this form of forage can take the place of much of the expensive hay which is usually fed to this class of animals. The fattening steer cannot consume much coarse forage of any kind, yet so far as his wants require there is nothing better than corn stalks with their bright leaves. For stock cattle and young things let this forage be liberally supplied in place of the more expensivehay. For dairy cows corn fodder has always ranked high, and this fact should mark its value for other animals without question. When stockmen have come to know how nature disposes of the nutrients in the corn plant he will have a higher appreciation of this forage. Let him first remember, as he has been repeatedly told, that corn is a giant grass, the seeds of which are placed in ear form. We know that timothy and blue grass bear leaves and stems containing much nutrition, even though the seeds are formed in the heads, and no one would think of wasting these portions of the plant merely because seed has been borne. Armsby, of the Pennsylvania Station, some years since, in studying the disposition of nutrients in crops of corn grown for grain, determined the data given below as the average for corn crops grown at four experiment stations:

Digestible Nutrients.	*Ears.*	*Stover.*	*Total Crop.*
	Lbs.	Lbs.	Lbs.
Protein	244	83	327
Carbohydrates	2,301	1,473	3,774
Ether extract	125	125	147
Total	2,670	1,578	4,248
Per cent	63	37	100

We learn from the above that 37 per cent of the total nutrients in the corn crop grown for grain are in the stover or husked stalks, while 63 per cent of the nutrients is in the ears. Farming is now too close a business to allow the corn grower to waste 37 per cent of his crop after he has gone to the expense of producing it. Of course, it will cost something to save the fodder, but even if half its value goes for this expense the percentage loss is still far too great to be ignored. One sometimes hears the excuse given for wasting corn forage that the farmer does not have stock enough to require saving any of this forage. If such is the fact, then the farm operations are out of balance. Such farmers grow either too much corn, have too much land devoted to meadow, or keep too little stock. When a proper balance is secured in these particulars there will be no waste of corn forage. Let the stockman see to it that this balance is reached as early as possible, for one sided farming cannot be profitable. While part of the crop of corn must be husked for the pigs, and while the steers cannot utilize as much forage as grain, the young things and stock cattle, together with the horses and cows, should easily consume all excess in these directions. So far as possible let shock corn be fed in its simple, original form, or at best merely run through the feed-cutter. It is expensive to husk corn and crib it, and nothing is added thereby to its value. An ear of corn surrounded with the husks which nature enveloped it is far more attractive to the steer or cow than is the same ear after it has lain in the corncrib for months subjected to the desiccating influence of the winds and to fouling by rats and mice. An ear of corn fresh from its natural covering of husks is to the ear of corn from the crib, as apples buried in the pit in winter time are to those which have lain in the open air for weeks. There is no comparison in the aroma and flavor of the two. There is a heavy expense attendant upon husking or snapping the corn from the bleaching standing stalks in the late fall; why not expend an equal amount if necessary in cutting and shock the corn a couple of months earlier and thereby saving the forage? The steer and cow will make no charge for doing the husking and enter no complaints at the task assigned them. Enough money has been wasted in husking corn in the west to pay off the National debt many times over. We have now reached a period in the development of our stock interest ann farm management where this great waste of the past should forever cease.—W. A. HENRY, IN *Breeders' Gazette.*

The NEW Smalley

The Most Up-to-date Silo Cutter on Earth.

SMALLEY CUTTERS For 1899 are more complete than ever before. They will be furnished, if desired, with Patent Automatic Self-Feed, **increasing capacity greatly and diminishing labor of feeding nearly ONE HALF. Four sizes, Nos. 16, 18, 20 and 26.**

Patented 1899.

If your dealer don't handle them, write for 99 Catalogue and get **SPECIAL Introduction PRICES on the SMALLEY LINE COMPLETE.**

"YANKEE SILO SENSE"—our latest Silo booklet, ex-Gov. Hoard's Latest Views—mailed free to any one naming this paper.

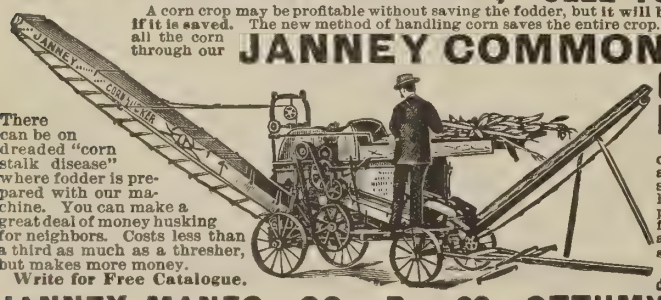
SMALLEY MFG. COMPANY, Sole Makers, MANITOWOC, WIS.

MAKE ONLY SWEET ENSILAGE

Ever since the ensilage system has been introduced in this country it has been the ambition and effort of siloists to ***produce sweet ensilage.*** The making of sweet ensilage depends principally upon two things—***1st.*** the use of a well matured crop and ***2nd.*** upon low fermentation. Granting the maturity of the crop, shredded ensilage makes the sweetest ensilage. The reasons are, that shredded material is of a nature that makes it pack much more closely in the silo. That means exclusion of air; there can be no extreme fermentation and consequent development of acid without the free action of the air. ***Shredded ensilage possesses other advantages in addition to its sweetness:—*** it is eaten with great avidity by animals, being a long, soft substance and free from any sharp angles and corners to cut or lacerate the mouth and gums; it is therefore fed with less waste.

The best way to Shred Ensilage is with the

St. Albans Ensilage and Fodder Shredder.



It is the Original Shredding Machine and all other so-called shredders are merely imitations of this one. ***It will certainly pay you*** to look into the merits of this proposition and machine before buying. We mail free a pamphlet on the subject.

ST. ALBANS FOUNDRY CO., ST. ALBANS, VT.

HUSK YOUR CORN, SHRED YOUR FODDER, SELL YOUR HAY.

A corn crop may be profitable without saving the fodder, but **it will be twice as profitable if it is saved.** The new method of handling corn saves the entire crop. The new way is to run all the corn through our

JANNEY COMMON SENSE Corn Husker and Fodder Shredder

There can be on dreaded "corn stalk disease" where fodder is prepared with our machine. You can make a great deal of money husking for neighbors. Costs less than a third as much as a thresher, but makes more money.

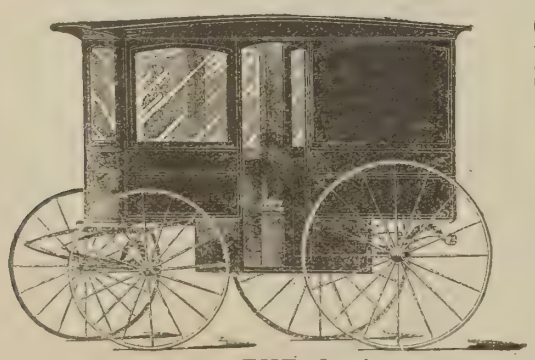
Write for Free Catalogue.

It husks out all of the corn clean, and shreds all the fodder at the same time. Makes clean, healthful food, as the patented screen in the feed elevator takes out all the dust, dirt, smut, etc.

Go to your nearest dealer and see one.

JANNEY MANFG. CO., Box 29, OTTUMWA, IOWA.

THE ONLY LOW-DOWN

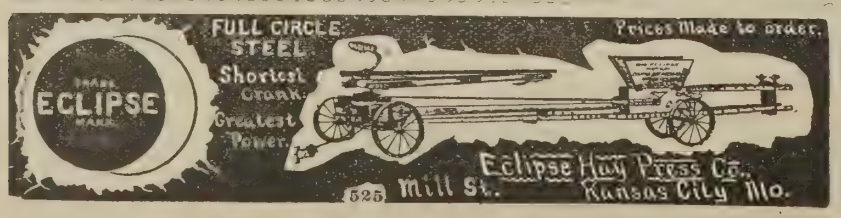


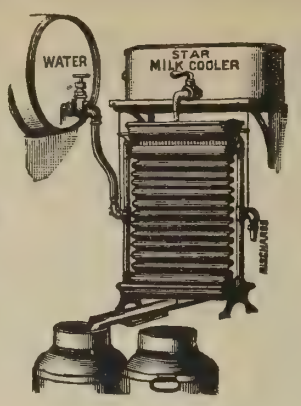
Short Turn, Straight Bottom, Short Coupled, Light Draft Wagon on the Market.

20 INCHES FROM GROUND to bottom of body. Will turn as short as any cut under reach wagon. Strong construction, nicely finished. Send for Catalogue, prices and terms Wagons for carrying Bottled Milk a specialty.

SHIPMAN, BRADT & CO.,
Sole Manufacturers,
DE KALB, ILL.

A Perfect Milk Wagon





On a Perfect . . . Short Turning Gear

WE make the only drop center wagon that has a self-balancing, short turning gear. All parts are wrought iron forgings. It is so plain and simple that it can't get out of order and if any part should break, any country blacksmith can easily repair it. All other wagons of this kind have complicated gears, and mostly made of cast iron.

Write us for our Catalogue, which fully illustrates and describes this wagon and 10 other styles.

THE O. ARMLEDER CO., Cincinnati, Ohio.

Star Milk Aerator AND COOLER.

If you have milk worth cooling at all, it is certainly worth while to cool it thoroughly. An efficient Milk Cooler will cool to within two degrees of temperature of water used; the Star does this and also **AERATES.**

If you would like to know the reason why, send for 1899 Catalogue of Sanitary Dairy Apparatus.

To be had for the asking.

STAR MILK COOLER CO., Haddonfield, N. J.

The Simplicity, Durability, Perfect Separation, and Convenience of Operation of the

DAVIS Cream Separator

Are Perfect.

Creameries as well as dairy farmers are interested in the Davis Cream Separator, as the gain in quantity and improvement in quality of butter is wonderful.

Correspondence solicited. Agents wanted.

DAVIS CREAM SEPARATOR CO.
88-92 W. Jackson St., CHICAGO, ILL.

The YOUNG AERATOR And Cooler

Needs no water or ice, removes all odors and gasses. Warranted to keep milk sweet from 6 to 12 hours longer than any machine on the market or money refunded. Circulars free.

W. H. YOUNG,
Box 135, Aurora, Ill.

GOLDOMETOR for locating gold, silver and other minerals. In a pocket case. Also Rods and Spanish Needles. Catalogue, 2 cent stamp. B. G. STAUFFER, Dept. H. D., Harrisburg, Pa.

YOU CAN PREVENT BLACKLEG

among your cattle by the use of Parke, Davis & Co.'s **BLACKLEG VACCINE.** Every lot is tested on cattle and found reliable before a single dose is put on the market. It will prevent **BLACKLEG** if fresh product is used, the same as vaccination prevents Smallpox in the human family. Operation simple, and easy to perform. Specify P. D. & Co.'s, and get the kind that is always reliable. For sale by all druggists. Write us for literature and full information, free on request.

THE NEW BOOK Feeds and Feeding

By Prof. W. A. HENRY,

Wisconsin Experiment Station.

This book should be in the hands of every stock feeder in the country. Every reader of HOARD'S DAIRYMAN ought to have it. It is a large, well bound book, nicely printed, over six hundred and fifty pages. Price $2.00

Four Yearly Subscribers at $1.00 Each ($4) Will Secure It as a Premium.

Four Yearly Subscribers at $1.00 Each ($4) Will Secure It as a Premium.

Of This Book Hon. JAMES WILSON, Secretary of Agriculture, Washington, writes as follows:

"Prof. W. A. Henry, Dean of the Agricultural Department of the University of Wisconsin, has recently given to the American student and the American farmer a work on feeds and feeding. Singularly enough, up to this time we have had nothing along this line sufficiently comprehensive from both the scientific and practical standpoints. We have had very able works from both, but Prof. Henry is the first to combine science with practice, and give us a work that will be of value alike to the instructor in the Agricultural College, to the student who is seeking the principles underlying feeding, and to the practical farmer who feeds.

This publication will take its place immediately in the college library, and ultimately in the private library of every farmer in the land. When the instructor, student or practical farmer inquires where there is a work thoroughly exhaustive of this subject, he can now be referred to Prof. Henry's book.

Sent as above, or will be forwarded, carriage paid, on receipt of price, $2.00.

Does Your Separator Need Repairs?

If it does, the place to get what you want is at our Chicago shops, where we are prepared to do all kinds of separator work upon Sharples machines of every description.

NOW DON'T FORGET WHAT WE SAY,

as you will save time and make sure of having your work done satisfactorily by sending all separator bowls or other separator parts requiring attention to Chicago.

THIS IS A NEW THING,

and creamerymen who have been sending their separator bowls to other points should bear in mind that we have opened up a repair shop here for the benefit of western creamerymen, and from now on all such work should be sent to Chicago. There are several machine shops around the country where they pretend to do separator repair work and to furnish Sharples repairs, but if you want our own make, *the genuine article*, and repair work which we will guarantee, you must send to our Chicago office. Of course creamerymen east of Chicago can depend upon getting their wants supplied at our factory in West Chester, Pa , but the western creamerymen can not conveniently send there We carry here a complete stock of Sharples Separator extras of every kind and description, all of which are made in our factory and guaranteed perfect, hence your orders for this class of goods should come here and not go to machine shops where separator extras are made by guess and are never fit to be used in a separator.

Please keep our new address in mind and let us hear from you when you are needing anything in the line of . . .

Cream Separators

The Tubular -- East and West

As an evidenee of what a perfect separator will do under widely varying natural conditions, we publish here two letters from users who are at opposite ends of the country The reader will observe that there was but a few days difference between the dates of these reports, but there was a wide difference in conditions. In one instance the most vigorous of winter conditions pertained, while in the other case February was practically summer. Notwithstanding these wide differences, the results were in each case practically the same. Could there be any better evidence of the superiority of the Tubular Separator than these voluntary endorsements? These are but a few of the many cases of a similar kind where the variations in conditions are greater even than these.

ENON VALLEY, Pa., Feb. 17. 1899.
Dear Sir: Am well satisfied with the Tubular Machine, she runs steadily and smoothly. I think she is very well constructed. We receive at the present time 3500 lbs. of milk daily, run it through the Tubular machine in ninety (90) minutes, use forty-five (45) lbs. of steam, revolutions 23,000. Skim milk test from new milk, .002; milk 12 hours old, .004: cream test from 30 to 35 per cent; cream in good condition. If you wish my opinion any time later on, I will be glad to answer any questions.
Yours truly,
CHRISTIAN RUCHTI.

NICARIO, CAL., Feb. 5, 1899,
Dear Sir: Everything is running nicely now. Tubular is doing daisy work. I have been skimming right along at .025 to .03 since you left. Revolutions 22,000, temp. 78 degrees Fahr., capacity 2800 to 3,000 lbs per hour. If any one wants a recommendation of the Tubular I am with you. I like it better every day. It takes me just ten minutes to clean it up, and it is done nicely too.
Yours truly,
A. J. COMPTON.

Sharples Tubular Separators

earn such encomiums of praise wherever they are in use. In addition to its large capacity, ability as a close skimmer, being easy to clean, etc., remember that—It is a safe machine—absolutely "burst proof." It has large actual and reserve capacity. It is economical in power, oil and repairs. It makes the smoothest and most churnable cream. It increases the yield of butter and makes better butter. It is built on honor and sold on its merits. Read, meditate, and then

What are Your Cows Worth?
Do they pay you a profit, and do you know how much? Have you tested them for butter fat? **You can make the test yourself.**

The NO-TIN Tester

is made in six-bottle size for farmer's use; it is driven by hand and is substantially built. Will last a life-time; fitted with ball bearings, and it does not rattle and does not wear out.

It uses the ordinary Babcock bottle and it does accurate work. Send now for our Catalogue, No. 71.

ELGIN MANUFACTURING CO., Elgin, Illinois.

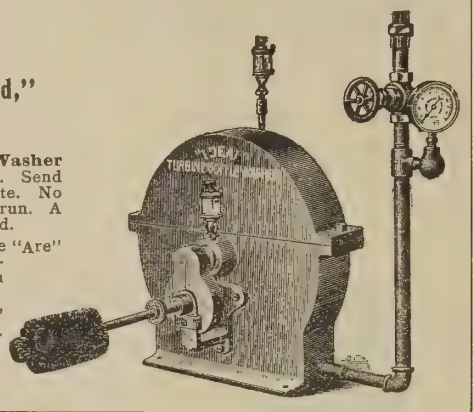
The Gem Fibre Butter Package

THE NEATEST, CHEAPEST AND BEST SMALL BUTTER PACKAGE Ever Made.

...THIS package is the result of years of study and experiment. It is made of waterproof Jute Board, and is lined with the very best quality of parchment, making it CLEAN, TASTELESS and ODORLESS. It is constructed without seams or open joints, being made one solid piece under heavy pressure, hence it is STRONG and NEAT. Owing to the material used it is LIGHT. It has more desirable features than any package on the market. These packages are put up in cases for carrying butter to distant markets or in bulk for local trade.

Write for full information and prices.

...SAMPLE BOXES FREE...



Some New Things are "No Good," some "Are."

The New IDEAL Steam Turbine Bottle Washer belongs emphatically to the "Are" class. Send for cuts of tanks and Turbine, complete. No belts, pulleys, or shafting, nor engine to run. A small boiler or steamer only is required.

The POTTS PASTEURIZER belongs to the "Are" class too. It is the only *perfect* Pasteurizer made. Send for circulars of it, which tell you why.

If you are in need of anything "*whatever*" in the Dairy or Milk Dealers' line, write us. *We are sure* to have it.

Send for our Milk Dealers' Price Current.

Subscriptions in United States, Canada and Mexico $1.00 per year; 6 months 50 cents; 3 months 25 cents.

FOREIGN SUBSCRIPTIONS may be sent through Sampson Low, Marston & Co., St. Dunstan's House, Fetter Lane, London, Eng., or their agents including the leading news dealers and book sellers in nearly all foreign countries.

All countries in the Postal Union $2.04 a year; not in the Postal Union $2.56.

Correspondents must not expect us to acknowledge the receipt of letters containing remittances for subscriptions. The receipt of the DAIRYMAN is sufficient notification that the money has been received. The label on the paper will show date to which subscription is paid. In case of renewals if date on label is not changed within two weeks after remittance is sent, inform us at once.

Remit by draft on Chicago or New York, or Post Office or Express Order; never by personal check.

ADVERTISING RATES.

Twenty-five cents per line, (agate measure) 14 lines per inch, each insertion.

Reading notices, 50 cents per line (nonpariel measure) each insertion.

THE Canadian exports of cheese from Montreal, from May 1 to September 9, aggregated 930,812 boxes as against 748,814 during the corresponding period last year, while the exports of butter were 240,799 packages as against 82,000 in 1898.

AN IMPORTED JERSEY.

The illustrations herewith are of the imported cow Pearl Pensee 122504, and the engravings were made from photographs of the cow herself, and not, as is sometimes the case, from some artist's hand-made picture of the cow. Pearl Pensee was 3d prize cow on the Island in 1896 and her yield at that time, forty-three days after calving, was forty-one pounds and twelve ounces of milk and two pounds, five ounces of butter. In comparing this record with those reported here it should be remembered that the Island pound contains eighteen ounces, and that it is not the fashion there to feed cows with highly concentrated feeds well up to the danger line.

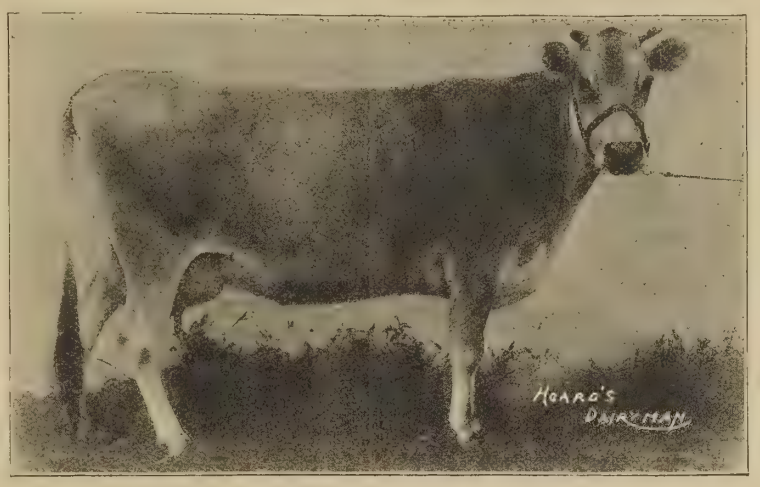
The rear view is given for the double purpose of showing a practically perfect udder and the necessity there is for nature to provide a suitable place and room for such an organ, and to show the relation of the escutcheon to the adjacent parts.

AN INTERESTING ICE-CREAM EXPERIMENT.

The New England Dairy Co. have installed an ice-cream plant in New Haven, Connecticut, where all the mechanical work of stirring and freezing is done by electrical appliances. The business was started at first, with one delivery wagon, but has so increased as to require eleven delivery wagons. Gov. Bradley, president of the company, says: "Judging by this experience, it may be that the by-products of our milk business may become even more profitable than the milk itself, which was what we started in for."

It is stated that Armour & Co., the great meat packers, make more money from the by-products of a steer, than they do from the carcass. The dairy judgment and comprehension of the country has not nearly fathomed the problem of using the by-product of milk in a manner commensurate with its value. This is seen in the wretchedly crude manner in which the skim milk is cared for at the thousands of creameries all over the land, as well as the subsequent judgment with which it is used by the farmers when they receive it.

There is a very large field for profitable study here, which very greatly affects the profits of every man who is keeping cows.



WAKING UP.

The dairy farmers about Elgin have lately been holding meetings to discuss their own business. Most of these farmers supply milk to the condensing factories, others to the creameries. One of the Elgin papers gives the following resume of the situation:

A leading dairyman said this morning that the farmers could not go on much longer as they had the past few years. Milk stated this morning that while in previous years his sales of cows in August had been 300 or more, this year he had not sold 100 so far this month. The farmers, he says, simply refuse to buy.

Most of them have expensive barns arranged for dairying, and it is therefore hard for them to shift around to other kinds of farming, but large numbers are turning their attention in other directions, and as soon as possible they will gradually decrease the dairy business and raise more stock. Of late years those who raised more stock and produce less milk are money ahead.

This summer the farmers who carried their milk to the butter factories and have it made up on the co-operative plan have fared far better than condensing factory patrons, because butter has been high, and besides that, the farmers get the skim milk back.

PEARL PENSEE, (Imp.) 122504, A. J. C. C.

Property of J. C. ROBBINS, Lone Tree Jersey Herd, Greensburg, Indiana.

is bringing eighteen cents per can less than it did several years ago, while feed, hired help, and, in fact, everything the farmer has to buy is much higher.

Of course this has been an exceptionally hard season on account of the drouth, causing the pastures to become bare and cows to dry up. Nearly every farmer in this vicinity has had his milk decreased over half. This with the low prices of milk has made his receipts less than his expenses.

Hundreds of farmers who purchased cows last fall have not been able to pay for them as they expected to do, and the consequence is that they will not be able to increase their dairies this fall as usual, to make a big supply of milk in the winter. Many others who are able to buy more cows and who have big farms and lots of feed, have stated they do not intend to buy a cow unless the prices for milk are made considerably higher by the condensing company.

One of Elgin's prominent cattle buyers This they say, is worth twenty-five cents per hundred pounds. That price has been offered for it. Some farmers say it is worth more to feed to calves, as they are very high at present. Calves six months old bring $15.

The farmers blame butterine largely for the low price of milk. They say that if but half as much butter was produced it would not result in a material increase in price. The breach would simply be filled by butterine. Until the butterine laws are rigidly enforced, milk, they claim, will not bring the price it should.

It will be a most excellent thing if something will stir the Elgin dairymen up to a better study of the uneconomical methods in which they have conducted dairy farming. In the first place they buy most of their cows. Every year buyers range over Wisconsin and Iowa buying up large droves of cows to sell to the Illinois farmers. The class of cows they demand and the way they handle them show plainly that they have not made a close, deep study of true dairy farming. The cow that is wanted is a big, beefy animal that will give some milk, of course. Then they take this cow, feed her a heavy ration of costly feed, much of which is purchased. The object is to fatten the cow and sell her for beef. It stands to reason that such cows are not profitable milkers in the true sense, especially when we consider the heavy expense which must attend them from the Elgin standpoint.

Then besides such a practice does nothing to educate the farmers in the finer and more profitable economies of the business.

The dairy farmer who would make the largest amount of money in a given number of years must adhere to the following principles:

1. He must select cows that produce milk, not beef, at the lowest cost and highest profit.
2. He must be a breeder of such cows.
3. He must study hard how to produce the main portion of the feed on his own farm.
4. He must understand something of the value of skim milk as a food for young animals and he must educate himself in a knowledge of how to handle it.
5. He must be a reader and student of dairy literature; must take deep interest in all these and many more problems connected with the true dairy farming.

It is only a few years ago that we saw over 20,000 pounds of skim milk daily turned into the gutter from one of the Elgin creameries because the farmers who were patrons of the institution did not know or care to know the value of this by-product. The creamery bought the milk and the farmers would not buy back the skim milk even at ten cents a hundred. This state of things evidenced the fact that the men who were representing the farm end of the Elgin dairy interest were not up to date students of true dairy farming.

One of the very first essentials in making a cow pay a profit is that she shall be a dairy cow, not a beef cow; that she shall be fed for milk production on a dairy ration, and not for beef on a fattening ration. Next, that the farmer shall intelligently provide against the period of annual drouth, that comes as certain as death and taxes, every year. There are a few dairy farmers in that Elgin region who have summer silos for this very purpose, but they do not sell milk to the condensaries. With all its boasted fame as a dairy region, there is yet needed in and about Elgin a lot of true dairy education, and all hail this latest move as a sign the farmers there are waking up to such necessity.

Healthy Hogs.

The health of hogs does not depend in any measure on the promiscuous feeding of drugs. If proper attention were given to all the hogs in the country, the makers of cholera cures would have no demand for their medicines. When it is said they live off the ignorance of the public it is but to tell the truth, and it is not saying anything against them or their remedies. These men who have studied hog cholera in all its phases are the first to say that the disease first gets its foothold in filthy pens and yards and from drinking stagnant water. From this start herds that are properly cared for become infected, and, if the season is favorable for the development of the germs of disease, an epidemic of hog cholera follows, that sweeps hogs worth untold thousands.

It cannot be said too many times that hogs are cleanly by nature. They are the only domestic animals that will habitually have a certain place in which to deposit their droppings, keeping the remainder of the range clean, if they are allowed to do so. Give pure water and plenty of green feed during the period of development and hog cholera, if it comes at all, will come from an outside source. Once it has arrived prompt measures to check its ravages should be resorted to and persisted in until the disease is checked.—*Swineherd.*

Tennesee Dairymen's Association, Sweetwater Jan. 25, 1900.

DR. BABCOCK'S work is meeting with deserved recognition wherever dairying is carried on.

The latest instance is in New Zealand, where a Babcock "Shilling Fund" has been started, with the object of testifying their appreciation of the value of the doctor's work.

AN omission occurred in our list of butter scores at the Wisconsin State Fair, in that the name of Byron Snyder, of Clinton, Wisconsin, should have been given, with a score of 93 points. This is not as high as Mr. Snyder's butter usually scores, but just where the judge found it defective is not yet known. Possibly, and as not infrequently happens when a single package is sent by either express or freight, it came in too close proximity with something not conducive to good results. A can of kerosene or other "loud" smelling merchandise, riding a hundred miles in proximity to a package of butter, will have such effect upon the quality of the latter that an expert judge will recognize it.

Effect of Formaldehyde as a Preservative in Milk.

Meat Inspector Schurtz and Dr. L. C. Grosh, health officer of the city of Toledo, O., have lately made some interesting experiments on the effect of the use of formaldehyde.

This is used as a preservative by some dairymen, and traces of it have been detected in several samples of milk. Twenty drops of formaldehyde was placed in a quart of milk and the solution left stand ten days in the sun. At the end of that time the milk showed no signs of souring, although there had been several thunder storms during the period.

The mixture was then tried on six cats. Three of them were killed on short notice by an overdose of formaldehyde, but the experiments on the others were especially interesting. One died eight days after the first dose was given them. In the final, the animal acted as if it had palsy, and a post-mortem examination showed that the intestines and stomach were badly inflamed. The second cat died last night, and an examination is being made on this animal today. The last cat died in such agonies that the meat inspector has changed the diet, and the other cat will not be sacrificed. The experiments thus far go to substantiate the claims made that the use of adulterations and impure milk have a deleterious effect on the health of infants, and has much to do with the heavy death rate from intestinal diseases in small children.

THE MICHIGAN OLEOMARGARINE DECISION.

We have received a copy of the Michigan decision, refusing to issue a peremptory writ of mandamus to compel a Justice of the Peace to issue a warrant on complaint for an alleged violation of an act, whose title reads: "An Act to Prohibit and Prevent Adulteration, Fraud and Deception in the Manufacture and Sale of Articles of Food and Drink."

The facts in the case, as stated in the complaint, are that the Dairy and Food Commissioner of the State went to the defendant's place of business and bought one pound of oleomargarine; that he called for oleomargarine, and that it was sold to him as such, labeled "oleomargarine", and stamped with the seller's name and address. The only point made by the Commissioner is that the oleomargarine was colored, and thereby made to be an imitation of butter.

The complaint was made under the fourth and sixth sub-divisions of Section 3 of the Act, which reads as follows:

An article shall be deemed to be adulterated within the meaning of this Act,

Fourth—If it is an imitation of, or is sold under the name of another article.

Sixth—If it is colored, coated, polished or powdered, whereby damage or inferiority is concealed, or if, by any means, it is made to appear as better, or of greater value than it really is.

A proviso is added to another part of the section to the effect that nothing in the Act shall prevent the coloring of butter.

In discussing the matter, the court says:

The Act charged in the complaint is neither adulteration, fraud nor deception under any definition of these words to be found in any dictionary. Adulteration is "The act of corrupting or debasing; the act of mixing something impure or spurious with something pure or genuine, or an inferior article with a superior one of the same kind.—*Bouv. L. D. 126, Century Dictionary.*

Counsel do not urge that it comes within the words "Fraud" or "deception". Neither is it urged that the article is made to appear of greater value than it really is. It is not claimed that the coloring matter used is in the least deleterious. The law permits its use to color butter, Counsel rely upon People vs. Snowberger, 113 Mich., 86. That case is not in point. The gravamen of the offence there was that the article of food was damaged, inferior, its inferiority concealed, and it was made to appear of greater value than it really was.

This brings us to the only question we need to determine, viz., Is the title to the act broad enough to include the sale complained of? Would any person reading the title to the bill in the legislative journals or elsewhere, suppose that the bill would make criminal an act which in itself was entirely harmless, honest, innocent, and contained no element of wrong doing? Or that it would change the well known definition of a word so as to include within it things which were in no sense akin to it and which could only be included in it by the most arbitrary enactment.

Would a manufacturer of, or dealer in, butter or oleomargarine be notified by the title that the harmless coloring of either was not only to be prohibited, but to be punished by fine or imprisonment or both? There can be but one answer to these questions. When the legislature attempts to change definitions and to make acts criminal which per se are innocent and contain no element of wrong, there must be something in the title to show such purpose or object under section 20, article 4 of the Constiiution. The title contains not even an intimation that an entirely innocent act is to be made a crime. It follows that this part of the act is void.

One's first impressions are, that if the decision is correct, the court places it upon untenable grounds. The statute quoted quite does away with the necessity of referring to dictionaries for a definition of the word adulteration, as it specifically sets forth what shall be deemed adulteration for the purposes of that act. Neither is it easy to see wherein the title is defective. Anyone, except a judge continually searching for reasons to the contrary, would think that every manufacturer of butter or oleomargarine would feel himself warned, when he reads that the legislature is considering a bill to prevent adulteration, fraud and deception in the manufacture and sale of articles of food and drink. Evidently the legislature of Michigan had this view, for they take pains to say that butter makers are exempted from the clause relating to color. It is, moreover, a matter of common notoriety, that both butter makers and manufacturers of oleomargarine did take cognizance of this bill at the time, and were fully advised as to its purpose and intended scope.

It, however, occurs to us that there might be less ground for objecting to the disposition made of the case, had the court said, as a matter of fact the complaint does not allege that there was any inferiority concealed—the substance purchased was oleomargarine, and the coloring did not add to or take from its intrinsic merits;—and whatever might happen with other purchasers at other times, in the particular case set out in the complaint, the coloring did not deceive or mislead anybody.

If a case could be had where a dealer had sold colored oleomargarine, and the purchaser had placed it upon his hotel table, and disposed of it to his guests as butter, it is not certain but the court should and could hold the seller as a party to the wrong. Or, if it had been alleged that the defendant was habitually selling colored oleomargarine to whomsoever might apply, and that among the number was one person who did not know that oleomargarine in its natural state was white, or would not have bought had he known that it was colored, then the case might have held. We prohibit the manufacture of oleomargarine, in order to make it impossible for anybody to dispose of it contrary to law, but Michigan laws cannot reach Chicago packing houses. Doubtless, the courts of Michigan would hold that it is unlawful to manufacture colored oleomargarine in Michigan, and that it is also unlawful to sell it to parties who could, if so disposed, resell it as butter. The words—"If it is an imitation of" must be construed as taking the place or performing the function, in one transaction, that would result in some other transaction if "sold under the name of another article."

It is much to be regretted that cases should be brought into court, where the offense charged is so purely technical and non-representative, as to occasion only sympathy for the defendant. In the case under consideration, there was no deception or attempt to deceive; the article delivered was precisely what was called for; the coloring matter used did not conceal any inherent damage or inferiority. If it caused the olemargarine to become an imitation of butter, it was at most a case of wrong without injury, or in law Latin, *damnum absque injuria.* No one would think of recovering in a civil case, under such circumstance, and much less could it be expected to succeed in a criminal prosecution.

The mischief done by the court is not in the actual judgment rendered, but in assigning unsound reasons for it, and pronouncing a wise law void.

Seeking Information.

Cattle Judging at the Wisconsin State Fair.

ED. HOARD'S DAIRYMAN:—My love for all the bovine race led me to attend the Wisconsin State Fair this fall. It has always seemed to me that a fine herd of blooded cows is the most taking ornament that a Wisconsin farm can possess. I feel like encouraging every breeder and urging him to still better results.

An incident at the fair, however, put a great damper on my estimation of the way breeders are encouraged in their work, but as I am not a breeder nor an expert in the dairy line, I would beg HOARD'S DAIRYMAN to give me and a few others a little light on the subject.

On entering barn B, where the Guernseys were kept, we beheld a fine looking man in a heated conversation with a modest youth, formerly of the Experiment Station. The tenor of his talk was against the honesty of the superintendency. He charged him with all kinds of rascality and underhanded meanness, in regard to the judging of the Guernseys. He stated that the first prize had been awarded a cow with one-quarter of her udder gone; and that the third prize had been given to a cow with but two perfect teats.

I asked one of the stable boys to show us the cows and as near as our judgment could bring it we found to our astonishment that the animal which took first honors had one teat almost wholly extinct and another one badly enlarged, while the other above mentioned cow seemed to be as the Ohio breeder said.

Our question to the DAIRYMAN is: Is an animal with a defective body entitled to a place in the show ring? We know that many inferior fairs, county fairs, etc., would not accept such animals for consideration in the awarding of premiums. The Ohioan seems to share this opinion.

We were in time to see the judging of the Holsteins and could not help but admire the way in which the judge handled the animals, how carefully he went over them. It seemed evident that this fine man was well acquainted with the Holstein strain of blood. He seemed the ideal judge.

Will owners of blooded cattle who would fain exhibit at the state fair have to labor under the impression that an animal with a plainly defective udder is entitled to as much right in the show ring as a perfectly faultless one? Will it be a standard to go by in the future? What would the Professors of the Experiment Station's advise? It seems to me that the higher the standard is, the finer the exhibition must be and the ultimate purpose of the fair more resultant, otherwise those who cook the goose will eat it.

Without any reflection on the past let us hope that when the Guernseys are judged next time, it will be under the supervision of a person acquainted with those fine yellow skinned animals and one whose first principle is disinterestedness. JOHN JONES.

We cannot agree with our correspondent's sweeping condemnation of the judging of cattle in the Guernsey class at the late Wisconsin State Fair. On the contrary we believe it is the general verdict, not only that there was an entire absence of favoritism, but that an unusual degree of intelligent discrimination and knowledge was manifested in awarding honors. This is not to say that the judge came to the right conclusion in every instance, or that we should have agreed with his every descision. Those who have had experience in judging stock, know how difficult it is to determine, even to their own satisfaction, which is the better of two cows when both are of superior merit.

As to the claim that first and third places were awarded to cows with defective udders and teats, we can only say that we shall be very glad when bloom and finish, and swollen udders are relegated to their proper place on the score card and elsewhere. There are other points of far more importance. The dairy cow is an intensely practical animal and with her as nowhere else does the may im apply, that handsome is as handson

does. Nicely polished and aesthetically trained horns, artistically plucked tails and the glossy hair that comes from double blanketing for weeks, may sway the judgment of the casual on-looker, who is looking for external beauty, but such things do not deceive the skillful judge. No cow should be condemned, and much less barred, simply because some accident has befallen her, resulting in the loss of a horn, or part of her tail, or one quarter of the udder. Other things being equal, such matters may be allowed to have a determining influence.

Read in this connection, the very sensible article copied this week from *Farming*, one of Canada's best agricultural papers.

And, finally, writing now only for the late Wisconsin State Fair, we say without any reservation, that there is not the least ground for so much as the shadow of a suspicion that the superintendent exercised or attempted to exercise any influence over the judge, or in any way favor one exhibitor above another.

Our Special Elgin Letter.

ED. HOARD'S DAIRYMAN:—But 1,800 pounds of butter were offered on Monday's Elgin Board of Trade. Bidding opened at 22½ cents and advanced to 23 cents, but no sales were made. The Quotation Committee declared the market firm at 23½ cents. The market for the corresponding week of the three preceding years were as follows:

Oct. 3, '98, 11,220 lbs. of butter sold at 20 cts.
Oct. 4, '97, 4,800 lbs. of butter sold at 22 cts.
Oct. 5, '96, 20,100 lbs. of butter sold at 16½ cts.

The New York market was reported steady at 24 cents. H. C. B.

Elgin, Ill., Oct. 2, 1899.

Something About Wheat Bran.

What We Lose by Exporting Wheat.

ED. HOARD'S DAIRYMAN:—The United States produces per annum about 600,000,000 bushels of wheat. She consumes and plants about 400,000,000 bushels; she exports about 200,000,000 bushels. Of this last, about 50,000,000 bushels are milled in the United States, the by-products, bran, etc., remaining in this country; the flour exported as such. The 150,000,000 bushels is exported as wheat grain, and the bran of this goes from us to foreign countries.

The 150,000,000 bushels of wheat milled, produces about 20,000,000 barrels of flour and 1,500,000 tons of bran (or by-products of which bran is the most valuable.)

The manufacture of this flour costs, say forty cents a barrel, or $8,000,000 for the 20,000,000 barrels, which cost ought to be kept at home and thereby keep also in addition the bran at home. Why? Because the feeding value of this 1,500,000 tons of bran is from ten to twenty dollars per ton; that is from $15,000,000 to $20,000,000 per annum—call it $20,000,000.

Our agricultural chemists agree that the manurial value of a ton of bran is $12.90; call it $10, then the fertilizing value of this bran is $15,000,000.

Then to recapitulate: $8,000,000 for milling 150,000,000 bushels of grain exported; $20,000,000 stock food value of the bran thereof; $15,000,000 manurial value of same. Thus we lose per annum $43,000,000, and our loss means the positive gain to foreign countries of this amount, to wit, $8,000,000 goes to foreign millers, $35,000,000 to feed the stock of Europe, to help them beat us in the markets of the world, by giving their dairy and other stock the best balanced of food rations, and their soil one of the best balanced fertilizers. (Be it remembered that the by-products of the manufacture of flour is one of our best stock foods and fertilizers.)

Now if the United States would pay one-half of the cost of the manufacture of the 20,000,000 pounds of flour as a bounty, to have this grain milled in the U. S., (or a bounty equal to the whole cost) we would save the $35,000,000 worth of stock food and fertilizer referred to, and our millers, stock raisers, dairymen and farmers at home be all benefited. Moreover, it would only be paying out a little more (or less) than the internal revenue tax we collect as a nation on the manufacture of oleomargerine and filled cheese, as a premium to injure our pure butter and cheese interests, and put us at a disadvantage with foreign countries who do not adulterate and use false brands.

In Canada, they punish criminally for the manufacture or sale of oleo or filled cheese. The present laws of the United States are clearly in the interest of Canada and foreign countries and to the disadvantage of our dairymen, stock raisers and farmers.

San Gabriel, Cal. A. B. CHAPMAN.

A Kentucky Situation.

ED. HOARD'S DAIRYMAN:—My dollar for your paper I think the best investment I ever made.

Please give me balanced ration for 1,000-pound Jersey cows from the following: Our last year's wheat in this section was very low grade, testing fifty-three pounds to fifty-four pounds to the bushel, of which I have 125 bushels and plenty of clover hay. Local prices are: Wheat bran, $14; ground or crushed oats, $22; corn meal, $18. Several Lexington dealers offer various mixtures of cooked and raw cow food, ranging in price from $22 to $28 per ton, and they know no more than I, if it be a balanced ration. In fact, as far as I can learn, very little scientific knowledge, as to cows, is practiced, based on experience or experiment. Generalization of ideas of forefathers, with little study, is the rule here.

Following suggestion in DAIRYMAN, I sowed in June, a small patch of oats and whipoorwill peas mixed, the latter six days previous to former. Excessive dry weather prevented growth. If you know of any other better feed for cows, likely to have shipped here at less cost than prices quoted, please mention and formulate balanced ration. I meant to ask, can I sell wheat to cows and hogs for more than 57 cents per bushel? If so, how. B. H. T., JR.

Donerail, Ky.

That low grade wheat, selling at 57 cents per bushel, would easily come to $20 per ton when ground, and certainly is not superior to good corn chop for feeding purposes. Oats at the price named are fully 40 per cent dearer than bran, while mixed feeds are of such uncertain composition and quality, that we cannot recommend them. There ought to be a foods stuff law in every state, similar to the fertilizer laws, requiring all mixed feeds and by-products to be accompanied by a guaranteed or official analysis and certificate.

From the feeds named we would select about as follows:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
20 lbs. clover hay	16.94	1.36	7.16	.34
6 lbs. bran	5.29	.75	2.32	.18
3 lbs. corn chop	2.67	.24	2.00	.13
Totals	24.90	2.35	11.48	.65

It would be a most excellent plan to have a supply of linseed oil meal in stock, and if not used every day in limited amount, feed some of it from time to time for its beneficent effect upon the digestive tract. There is nothing known to us, that can be given to cows, which comes so near to replacing the fresh grass of summer, or roots, or silage in winter, as a prime quality of linseed oil meal.

INQUIRIES AND ANSWERS.

Every inquiry must be signed with the name, Post-office and state of writer. Condense the questions into plain specific inquiry. Be careful to note if your questions have not been answered in replies to others. We are glad to answer all the pertinent questions that we can concerning machinery. Look over our advertising columns and write to the advertisers.

FEEDING STANDARDS FOR MILCH COWS.

Dry matter.	Digestible Nutrients		
	Protein.	Carbohydrates.	Ether extract.
lbs.	lbs.	lbs.	lbs.
23 to 28	2.0 to 2.5	12 to 15.0	0.5 to 0.8

FOR MASSACHUSETTS HOLSTEINS.

If it would not be too much trouble, I would like to have you make for me a ration for my cattle (mostly registered Holstein-Friesian) out of the following named foods: Fine June grass hay mixed with red top, $10 per ton; oat hay cut in the prime state and cured well, $12; cotton seed meal, $24 per ton; linseed, old process, $23 per ton; bran (wheat bran, of course) $19 per ton, and Quaker Oat Feed at $18 to $18.50 per ton.

I make milk for city trade, and sell to a milk peddler at 24 cents per can, taken at the door, and I furnish twenty-five cans a day. My milk tests, on an average for my whole herd, by the Babcock test, from 4.2% to 4.4%. M. M. H.

Sutton, Mass.

We suggest, as an average daily allowance per cow, for the entire herd, the following:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
20 lbs. hay	17.00	.96	8.42	.30
6 lbs. bran	5.29	.75	2.32	.18
2 lbs. oil meal	1.82	.59	.65	.14
1 lb. cotton seed meal	.92	.37	.17	.09
Totals	25.03	2.67	11.56	.71

There is so little to choose between the different kinds of hay named, and between the bran and Quaker Oat Feed, that they may be fed interchangeably, or part of one and part of the other—provided there is no choice as to the quality.

The amount of carbohydrates is a trifle low especially for winter, unless the cows are well housed. We look to the carbohydrates for the material to maintain the body temperature, and unless the stable is reasonably warm, and the cows are kept out of storms and exposure to severe weather, there must be a proportionate increase in the carbohydrates. Nothing would be better for this purpose than a little corn chop.

And withal, for we cannot too often repeat this caution, do not omit the daily allowance of salt and convenient access to water that is at least twenty degrees above the freezing point.

A LOUISIANA RATION.

Please give me ration from following feeds: Cotton seed meal, $16 per ton; wheat bran, (full of shorts) $15; alfalfa, $13; corn meal, $12.50; cotton hulls, $3.50; Texas hay, (prairie) $8. Cows are medium size grade Jerseys.

Shreveport, La. G. W. S.

If the Texas hay was not allowed to get too ripe before cutting and is otherwise of good quality, we should be inclined to use it and cotton seed meal instead of the higher priced alfalfa. In that event the average daily allowance per cow would be about as follows:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
15 lbs. prairie hay	13.12	.58	6.27	.21
5 lbs. hulls	4.44	.15	1.65	.09
5 lbs. corn chop	4.45	.40	3.34	.21
3 lbs. cotton seed meal	2.75	1.12	.51	.24
Totals	24.76	2.25	11.77	.75

Mix the hulls with the corn chop and cotton seed meal at feeding so as to give the mass greater bulk.

ORCHARD GRASS—PRESERVATIVES.

Would it be best to seed my farm mostly to orchard grass for hay and pasture, with clover and timothy mixed? Would it be wise to use milk preservatives in milk? Please excuse me for troubling you.

Beaver Co., Pa. G. N. H.

To both of the above inquiries we answer, No. There may be conditions which would justify the seeding of a considerable area to orchard grass, but under no circumstances is it wise, or prudent, or honest, to dope milk with preservatives.

ABORTION.

My dairy herd of twenty-six cows have all aborted with but two exceptions, within sixteen months. I have a regular veterinary (a graduate of their best colleges) in attendance. He does not seem to be able to check it. Will I have to clean my whole herd out? Is it possible for some cows to be immune to abortion? N. B.

Don, Ont.

One ought not to speak too confidently upon this subject, but the writer's experience in his own herd seems to warrant the conclusion that cows do become immune to abortion, and from like experience we feel warranted in giving this inquirer encouragement to believe that by far the greater number of his cows will become regular breeders again.

With a competent veterinarian in charge, it may be presumptuous for us to offer any advice, but the reports which come to this paper indicate that perfect sanitary conditions are more effectual in staying the ravages of this disease than any form of medication. Let there be a thorough cleansing and disinfection of all the stables and their belongings, and for the way of doing this consult the index to the former volumes.

If this inquirer and other readers are not preserving files of the DAIRYMAN, they should commence to do so without further delay.

WHEN IS THE MILK SECRETED?

Is anything definitely known as to how and *when* the milk is secreted in a cow's bag? Is it, just at the time of milking, secreted from the blood? How long after a cow has eaten certain food before it is converted into milk?

Ontario. N. B.

Something is known on this subject, but not everything. It may be said, in the first place, that milk is not secreted in the proper sense of that word, and, in the second place, that it is not formed directly from the blood. There are elements in milk that cannot be found in the blood, but just how and where they are produced is a mystery. What we do know is that there are innumerable cells built up in the udder, and that when these break down milk is elaborated. There are various milk ducts and small cisterns in the udder of the cow, which always contain more or less milk, when the cow is not dry, but their extreme capacity would amount to but a fraction, when compared with the total yield. It is therefore certain that the greater part of the milk, in the condition in which it leaves the udder, is the result of transformations which take place while the milking is in progress.

It is still more difficult to answer the second question. Certain feeds, for example, turnips, will affect the milk very quickly,—in fact, almost instantly, but it is doubtful if this comes from the regular processes of digestion and assimilation. Odors, as we know, are volatile. An onion exposed in a closed room will quickly infect all the atmosphere in that room, and this without suffering any appreciable diminution in form or substance. So some feeds will taint both flesh and milk long before their material substance can be transformed into either.

A PENNSYLVANIA RATION.

I have hay, mostly timothy, $11.00; lots of oat straw, $6.00; corn fodder, after corn is husked, will cut it in two-inch lengths; corn, 40 cents per bushel; oats, 30 cents per bushel. Do our own grinding. I can get feed at prices quoted: bran, $16.00; middlings, $17.00; oil meal O. P., $26.00. Cows average 900 pounds each. G. N. H.

Beaver Co., Penn.

The list of feeds given above runs largely to the carbohydrates, and it will not be an easy matter to arrange a ration formula that will supply the requisite amount of protein. This fact alone makes it impossible to include either the corn or the oats at the prices named. As bran contains fully one-third more protein than oats, it follows that selling the oats at thirty cents per bushel and buying bran at sixteen dollars would be a profitable transaction. From the feeds named we would suggest the following:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
8 lbs. hay	6.86	.22	3.47	.11
8 lbs. stover	4.76	.14	2.59	.06
5 lbs. straw	4.54	.06	1.93	.04
8 lbs. bran	7.04	1.00	3.09	.24
2 lbs. oil meal	1.82	.59	.65	.14
Totals	25.02	2.01	11.73	.59

It would materially improve this formula to take out four pounds of bran and substitute two pounds of cotton seed meal or three pounds of gluten *meal* or three pounds of buckwheat middlings.

FARMERS' NATIONAL CONGRESS.

[Address of President W. D. HOARD, of Fort Atkinson. Wis., at the 19th Annual Meeting, Faneuil Hall, Boston, Oct. 3, 1899.]

GENTLEMEN OF THE CONGRESS:—It is said that no man is a dutiful son who does not revere the memory of his parents. And so with like pertinency we may say that no American is a complete patriot who does not possess a profound regard for the early history of his country. We are met to-day for the 19th annual meeting of this Congress, on ground and amid scenes sacred in the heart of every true patriot. To each one of us comes a resolve of renewed devotion to our beloved country as we hear the name and gaze on the walls of Faneuil Hall. The name of Boston and this grand old Commonwealth of Massachusetts, with their heroic history, their steadfast adherence since the beginning of the nation to republican ideals of government, their magnificent contributions of intellect and patriotic purpose to the growth of national character, achievement and destiny, all these fill this hour and occasion, with inspiration.

To these hallowed precincts we bring the dignity of the American farm and the ennobling influence of American labor.

There is the stimulus of high resolve in the commingling of such associations and such purpose.

Massachusetts, with its upwards of two and a half millions of people, contains only about one hundred and fifty thousand farmers. Yet no state in the Union has been more loyal to agriculture or more lavish with its means for the promotion of agricultural objects. Its colleges and schools and all the culture they have bestowed; its vast wealth and progressive thought, representing more than two hundred years of thinking and working; in a word its civilization is, after all, but the fruit of human industry, the harvest that is promised always to a union of intellect and labor.

A most healthy sentiment pervades this commonwealth, for we see here the possessors of its largest fortunes and highest scholarship contributing generously of both these great forces to the promotion of agriculture.

The same sound state of sentiment prevails in regard to legislation for the protection of the producer and consumer of food, against adulteration and counterfeiting. It was Massachusetts that first enacted an anti color law in regard to oleomargarine, and she valiantly fought it through to an established victory in the highest court in the land. This law has now been placed on the statute books of thirty-three other states.

These things cheer us greatly, for by them we realize that we are among men and in a state where the farm is honored and its highest evolution hoped for.

THE FARMER AND THE TEACHER.

The principal drawback and hindrance to agricultural thought, profit and progress, is a lack of union and sympathy between scientific theory and the every-day practice of the farm. As yet there is a wide gulf between the teacher of Agricultural Science and the working farmer, and our farmers are especially lacking in appreciation of the great value to them of the scientific teacher. A moment's study of the situation will disclose a reason for this. The farmer knows from hard experience what he knows. He has worked it out with his hands. He may not have used his mind as he ought; may not have seen what science has to give him, but it is because he has had but little time to leave hand work for brain work.

But beyond this is a lack of sureness in his mind of the truth of what the agricultural teacher is saying. He is not sure that the facts which environ him are the same as those which surround the teacher. His isolation on the farm compels him to be independent and self-reliant. He can depend on no one but himself for the soundness of his judgment or a hand to execute it. He thinks that very much of what is done at Experiment Stations, taught at Agricultural Colleges, or related in dairy and farm papers, for instance, is nothing but theory. He cannot see how it is going to help him. And because he does not see he does not accept. Who can blame him? His business is to make a profit out of farm work, be it ever so small. He must earn more than he spends, for very likely there is the interest on the mortgage to satisfy. If he cannot make a margin in any other way, he must do it by hard self denial of many comforts, and still harder work. It is hard on the wife, on the children and on himself, but there is no help for it; he must pay his debts. No wonder, then, that he cannot always see that he can follow the advice outsiders give him. Most men will not act any further than they can see. There needs to be instituted a new order of teaching agriculture in this country, such as is being done in some of the countries of Europe.

The mountain will not, cannot if it would, go to Mahomet. There should be established, at various places in each state, experiment and demonstration farms carried on by men who can correlate both science and practice. The Canadian government, under the wise direction of Prof. Robertson, has solved this problem in one line at least. It has introduced dairying into regions where the industry was unknown, by building cheese factories and creameries, in the latest and most approved form, and placing them in charge of graduates of government dairy schools. These institutions were maintained until the farmers about them had learned the way and method of true practice, when they were absorbed by local capital. In this way the farmers learned that what they are too apt to call "theory" and "book farming" was the essence of practical method

The *Southern Farm Gazette*, in noting the fact that the German farmers import from 4,000,000 to 5,000,000 bushels of corn a week to feed their fattening animals, says:

"It does seem a little strange that German farmers are able to import American corn for hog and cattle food, while Southern farmers claim they cannot afford to raise pork on corn. Where is the difference—in the stock or the feeders?"

The German farmer is a scientific feeder. He is a believer in the balanced ration. He makes large use of his experiment stations. When a little boy, he was taught the elements of agriculture in the primary school. When he became a man he was a reader and student of the science of feeding. If any professor, like Wolfe, had patiently experimented on the feeding question, the German farmer did not sneer at him and call it "all book farming and theory." He reached out after the truth wherever he could find it. As a consequence, he can pay the freight on American corn for 4,000 miles, pay the speculator's profit for it besides, and make money by feeding it. When our American farmers evidence a disposition to respect what science is patiently doing for them, and become more studious and intelligent, they will make more money with their farm animals.

But something must be done to close up this gap between the farmer, and what agricultural science has to offer. The Short Course in the Wisconsin Agricultural College, the Dairy School, the Farm Institutes, the Wisconsin Dairymen's Association, all aided very greatly by the agricultural press, are doing what they can to close this gap in Wisconsin. I speak more particularly of my own state because I am more conversant with the results obtained among the people. These forces are taking hold of our young men, giving them a broader idea of what it means to be a farmer, and how a better study of what science has to give will lighten their labor and increase the profit of that labor. Three great ruling objects control here: To make better farmers, and thus encourage the making of more farmers. Hard, unthinking, unprofitable farming drives the boys away from the farm. The farmer must give his boy a chance to know a little more than he can teach him about farming in these days, or he will leave the farm. The third grand result is the building up of the wealth and agricultural prosperity of the state, which comes as the crowning result of a wiser and more practical union of the farm, the farmer and the teacher of agricultural science.

EDUCATION.

God said: "Let there be light." The average farmer of this country does not yet squarely believe in that principle as an aid to himself and his farm. He has too little sympathy for agricultural schools or for organized methods for a better agricultural education. This is seen in the fact that, as a class, he spends thousands of dollars to educate his children to be lawyers or doctors, where he spends one dollar to especially fit them to be intelligent farmers. This strange indifference to the advantages which a trained use of knowledge imparts, is difficult of explanation. But few farmers believe that there is such a thing as a science of agriculture. The great mass do not believe that the thing we call farming, can be taught to their children from books or schools. The American farmer will admit the necessity of a special intellectual training to be a lawyer, doctor, preacher, editor, merchant, or mechanic, and his sacrifice for the education of his children in everything but farming is without parallel in the history of any other nation. He sees clearly that if his boy is to understand the principles of law, of medicine, of mechanics, or of banking, he must look into books and read there the record of the experience and judgment that have gone before him. That boy's intellect must be trained to discern a principle on the printed page and then, by practice, learn how to apply that principle to produce material results.

Do you suppose that the farmers who swarmed out of New England and New York into Ohio, Michigan, Indiana and the farther west, would have reduced the fertility of their lands as they have done, if they had been taught in the country schools, when boys, the meaning and methods of conserving nitrogen, phosphoric acid and potash, as fertilizing agents?

Is there a farmer here that ever heard those agents of all plant growth mentioned in the studies of his boyhood?

I feel deeply on this great lack of primary farm education. I had to face it in my own young life and the boasted statesmanship of my country has not yet provided conditions much if any better in this direction than those which obtained fifty years ago.

The difference between successful and unsuccessful men in all callings is not luck, but rather judgment and energy. Good judgment is an act of the mind, and one must have a mind well stored with sound knowledge, and well trained to use it, in order to exercise the best judgment. I see a ray of hope in the fact that this great national body of farmers have come to see the tremendous importance of this question. I hope you will include it every year in your programmes until discussion is crystalized into action all over the nation.

Ideas govern. Wrong ideas or lack of right ideas govern just as rigidly as the best of ideas. Good sound thought, correct ideas of theory and practice must take the place of unsound ones, or there can be no improvement in the productiveness and profit of our soil or animals.

When we see a man farming in a wasteful way, or with animals unfitted to his purpose, we know conclusively that that man lacks right ideas of his business.

The outcome of the labor of his hands will depend not on the strength of the hands, but upon the soundness of the ideas which govern the hands.

This is seen and demonstrated in every community of farmers in the world.

For instance, dairy farming is essentially a work of ideas. It is largely governed by forces and conditions which have sprung into being in the last 30 years. The creamery, the cheese factory, the centrifugal separator, the silo, and refrigerator transportation, are among these new forces. They are being adopted all over the world, and the result must inevitably be to reduce the market price of dairy products. If the American dairy farmer will use his brains, will study and post himself, and imbibe the ideas of better soil management, better ideas of feeding, and improve the dairy quality of his cattle, he can keep ahead of the tide, and so, by reducing the cost of his product, continue to make a good living profit.

The American farmer can produce milk cheaper, if he will, than any farmer on earth. Yet the farmer of Holland, with land that is worth from $180 to $500 per acre, produces milk at less cost per gallon than the average American farmer. The Dutch farmer is a hard student of all the latest and best ideas in economical production. He sends his sons and daughters to the dairy schools, and so keeps himself in touch with all better ideas. The average yearly value of the product of the Dutch cows is $75, which is 50 per cent greater than in England or the United States. What is true in this respect of specific dairy farming is no less true of every other branch of agriculture.

CO-OPERATION.

The vast extent to which the organization of trusts has attained, means simply that the men who represent these varied interests have learned to co-operate for mutual benefit. Like every other social power and privilege it can be carried to an extent where it amounts to a conspiracy against the general welfare. When that time comes the people will cope with it successfully. The American people have never been enslaved and they never will be.

But there is a hint in all this combining that is going on, that the farmers should take to heart. Except in dairying, and to a small extent in fruit growing, this great lesson is utterly unheeded. Every creamery and cheese factory could easily be made the means of a larger and more beneficial use of co-operative economics. In France over 600,000 farmers are members of supply associations through which they buy fertilizers, implements, blooded stock and sell their produce. Co-operation for the farmer does not mean the formation of some gigantic stock concern which will end in a game of "freeze out." Every instinct of reason and experience bids us avoid such schemes as we would the plague. But in the broader sense and logic of their necessities, and not the necessity of some promoter, farmers should study co-operation.

"One Year's Seeding, Nine Years' Weeding."

Neglected impurities in your blood will sow seeds of disease of which you may never get rid. If your blood is even the least bit impure, do not delay, but take Hood's Sarsaparilla at once. In this course there is safety; in delay there is danger.

Hood's Sarsaparilla Never Disappoints

Hood's Pills cure liver ills; the non-irritating and only cathartic to take with Hood's Sarsaparilla.

PRESERVATION OF THE FARM.

As farmers we need to be constantly agitated from the standpoint of maintaining the fertility of our soil by the wisest administration of the forces at our command. It has been stated, with how much accuracy I cannot say, that the decline in the values of farm lands in the last thirty years in the State of New York alone, has reached the enormous sum of over *one billion of dollars*. The same condition applies to the farming lands, in greater or less proportion, from Indiana eastward to the Atlantic coast. The loss in agricultural wealth to the nation, arising from this condition, is almost beyond calculation. The only increase in either population or wealth, in the territory named, has been in the cities and villages. In the country there has been a manifest decline in the productivity of the farm, and the pride and ambition of the farmer. Two causes, in my opinion, have conspired to this lamentable result. (1) The drainage to the city of the best mental elements of the farm. Mind always goes before matter. (2) A corresponding and consequential drainage in the same direction of the productive elements of the farm. Fertility has been sold out of the soil by the bushel and by the ton.

In the great middle west a different condition exists, which, up to the present time, has arrested this great current of waste and destruction to a certain extent. As fast as the sons of American born farmers have abandoned the old farm there has come in a farmer from Germany or other countries in Europe. This European farmer possesses two valuable traits of mind and training: (1) His home government has taken pains to give him in the primary schools, some education at least, in the elements of agricultural science. He has been severely trained by practice in the art of soil preservation. He is a careful, pains-taking husbandman. (2) His sons have an ambition to become farmers. The father is on the lookout for farms near his own for his children. This creates a demand for farms, because first there is a farmer.

The agricultural mind of this country must come to a better comprehension than it has had of this chain of causes for the decline or enrichment of a country. We must settle down practically and hard, to the conclusion that we must commence with the child if we are going to make good farmers, for without good farmers the country will soon go to destruction. There is the highest statesmanship and love of country involved in this question. It should engage the earnest attention of the educational and political forces of the nation.

PRESERVATION OF POLITICAL INDEPENDENCE.

For our own sake as farmers, and for the sake of our country, we need to be constantly agitated and aroused in another direction. There is larger need than ever in our nation's history for the old time resolute independence of character and political judgment which once characterized the American farmer. Fifty years ago the present corrupt party boss, with his assessment of corporations and control of legislation would not have stood

Finer Flavor, better quality, better price; that's what results from the use of the Champion Milk Cooler–Aerator in your dairy.

Our book about it free.

CHAMPION MILK COOLER COMPANY,
67 Main St., Cortland, N. Y.

for a moment before the courageous farm judgment of the country.

To-day this political merchant, who trades in the temple on the political and material fortunes of his fellows, has fastened octopus like on the nation and exercises a most dangerous power in state and national legislatures

The sentiment of the farming classes is no longer regarded by the political boss with the wholesome dread that ought to exist. This is largely due to a serious decline among farmers of individual independence of political thought and action, a substitution of mere party for patriotic standards of judgment.

A corrupt and debauching spirit of commercialism pervades our political atmosphere and poisons the fountains of law, liberty and progress. I would not advocate the formation of an agricultural party to correct this evil, for I do not believe that any man should administer his political duty in this country according to the trade he follows, the race he belongs to, or the religion he professes. But I do hope to see the farmers stand forth as strongly as they did of yore, the terror of corrupt politicians and the hope of honest government everywhere. This can only be brought about by a sturdy refusal to follow the lead of corrupt party leaders, in all parties.

It is largely through this submergence of the political influence of the farming classes that the present unfair and offensive systems of taxation exist.

Property is property. Taxation should be based on the dollar's worth of property, no matter how it is invested. That which the law recognizes as property and defends as property, should be taxed as property, according to its value. A general violation of this principal is producing wide spread demoralization and discontent in society. Men who pretend to be men in everything else, coolly become perjurers in order to save a few dollars in taxes.

The final effect may be comprehended in this question: If a man will swear falsely to cheat the public, how long will it be before he will perjure himself to rob his neighbor?

Let me suggest a partial remedy, at least: After the assessor has completed his work, and a month before the final review, let it be required by law that the personal property list shall be published and placed before the public eye. There is great moral force in publicity. As farmers especially we should create public sentiment in favor of such laws, for a very large proportion of the property of the country escapes taxation.

This Congress meets annually to discuss questions which, in its judgment bear with vital force on the well being of the agricultural classes. Its first and chiefest concern should be to arouse the minds of farmers to a broader understanding of how they may help themselves. We should do what we can here to arouse a wide spread public sentiment in favor of specific legislation, both state and national, against the counterfeiting of human food. We must demand this in the interest of the consumer as well as the producer. The general government has no police power. That is reserved for the states. But the general government has unlimited power of taxation. It exercised that power to the extinguishment of the state banks. It exercises the same power in many of its tariff schedules. Every farmer in the land should, in my opinion, demand of his representative in Congress that adulterated and counterfeit foods be subjected to a national tax sufficient to drive the same out of existence. It is fair and just to demand of the law making power of this government that the American farm, with its product of pure and honest human food, shall not be driven from its rightful market by fraud and deceit. You can do the cause of agriculture no greater service than by uniting all the force you have individually and collectively for the accomplishment of this purpose.

New York Drouth and Small Milk Receipts.—Price of Cheese.—Cheese and Meat.—Beef and Milk as Foods.—The New York Oleo Cases.—Silos and Silage.—Wheat Yields.——Frozen Silage.

ED. HOARD'S DAIRYMAN:—The long drouth, eight weeks, was broken yesterday, the 18th, when we had a copious shower. Showers also fell last night, and one is now on this morning. But it is too late in the season to benefit anyone, except, so far as it makes fall plowing more easy, lays the dust that was very deep in the roads, and quenches, in part at least, the numerous forest fires that have been burning, for weeks, in Northern New York. The weather is mild, and should the frost delay its advent a week or two, for which all are praying, the pastures may freshen a little, thus increasing the milk flow somewhat; but it is so late that, should the grass start, the frosts will soon nip it.

All the cheese makers say that the milk receipts at the factories were never so low at this time of the year—less than fifty per cent of the amount received at the June flush—so that, when this difference in milk yield is considered, although cheese is about two cents per pound higher than it was last year at this time, the patrons of the factories do not carry home any larger checks than they did at that time.

At the meeting of the Watertown Produce Exchange, last Saturday, the 16th, there were 4,639 boxes of cheese offered, but only 2,587 were sold, the ruling price of which was 10½ cents, fully a cent and a quarter lower than at the meeting two weeks before. Our factory, as well as nearly all the others in town, sold; but as will be seen, about one-half of the salesmen refused to sell. Perhaps they have done the right thing, but the indications are for lower prices yet.

Indeed, it was expected by some, that last week's ruling would be ten cents, but the buyers saw that no cheese could be bought for that price, so squeezed the price up to 10½ cents.

With the cable quoting the same figure it did two weeks ago, it was very evident the sellers were in no mood to withstand another half cent drop.

If, however, next Saturday's ruling is not down to ten cents, some of us will find ourselves mistaken, although the decrease in the milk yield must necessarily continue. What with no pasture, scarcely, and in many of them no water but a surplus of the fly pests, it is little wonder that the milk flow has fallen to an October 15th figure, and that salesmen should demand, as a result, still higher figures for their cheese. But they should consider one vital point, which is, that no matter how curtailed the production of cheese is, or may be by reason of the drouth, and a shortage of green foods, when the price reaches a certain figure some people will stop buying it, although, at even a higher figure, it may be more profitable as a food than is beef or some other meats at present prices, and which they do not refuse to buy every day. This will always be the condition until consumers are educated up to a higher level, by being shown the superior food value of milk over these meat foods.

Just as long as they do not know that a pound of good, full cream cheese, costing say, fifteen cents, contains more nutritive value than does two pounds of beef steak at the same price, or higher, they will refuse the cheese and buy the meat. They seem to consider cheese, not as a really necessary food, but as a luxury instead, to be indulged in only by the rich, and as a necessity on hotel tables and in high toned restaurants.

When I took that Ellisburgh cow census, I ate dinner in forty farm houses, but I saw cheese on four tables only, while roast beef or some other kind of fresh meat was found on nearly every one.

It is a "campaign of education" that needs to be made and fought to a finish, and the first battle should be fought in the farmer's institutes. There is too much "balanced ration" for the farm animal, and not enough for the human animal on the farm and elsewhere.

This work of educating the people, in this direction was inaugurated at the institutes last winter by Director Dawby, and is to be continued the coming winter. Miss Anna Barrows, one of the editors of the *American Kitchen Magazine*, a lady from Washington, D. C., and our own Jimmie Rice, of Yorktown, New York, each gave lectures devoted to the human food problems, illustrated by charts, as well as in real cookery on the stage.

Mr. Rice had four large charts on which were the figures showing what one may buy for one dollar, as well as the difference in the nutritive value of the foods we eat. All the cereals, vegetables, native and foreign fruits, milk, butter, the different varieties of cheese, fish, oysters, meats, fowls, eggs, etc., were included in the whole, furnishing the material for a very instructive and entertaining hour's lecture, which, when possible, was always given at the evening session. In it was always shown and clearly pointed out, the superior value, and the advantage which milk and cheese have over all flesh foods.

In a recent issue of the *Rural New-Yorker*, Dr. Jordan, of the Geneva Experiment Station, has an article bearing on this food problem in which he says:

"The great cost of beef over milk, works itself out in commercial conditions. When the New York millionaire buys hygenic milk for his growing boys and girls—if he happens to have any—at eight cents a quart, and tenderloin steak for himself at 25 cents per pound, he pays 25 to 26 cents a pound for edible milk solids, and not far from 61 cents for a pound of edible beef solids, or, in proportion to the energy value of the two foods, practically twice as much for the beef, as for the milk solids. The same general relation holds in our villages where milk sells for five cents, and decent steak for 15 to 18 cents.

Milk is unquestionably the cheapest high-class food which the market offers. This is a truth not generally appreciated by the pub-

Have You Been Sick?

Perhaps you have had the grippe or a hard cold. You may be recovering from malaria or a slow fever; or possibly some of the children are just getting over the measles or whooping cough.

Are you recovering as fast as you should? Has not your old trouble left your blood full of impurities? And isn't this the reason you keep so poorly? Don't delay recovery longer but

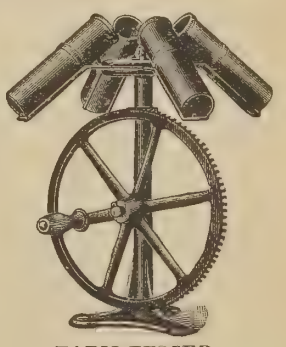
Take

Ayer's Sarsaparilla

It will remove all impurities from your blood. It is also a tonic of immense value. Give nature a little help at this time. Aid her by removing all the products of disease from your blood.

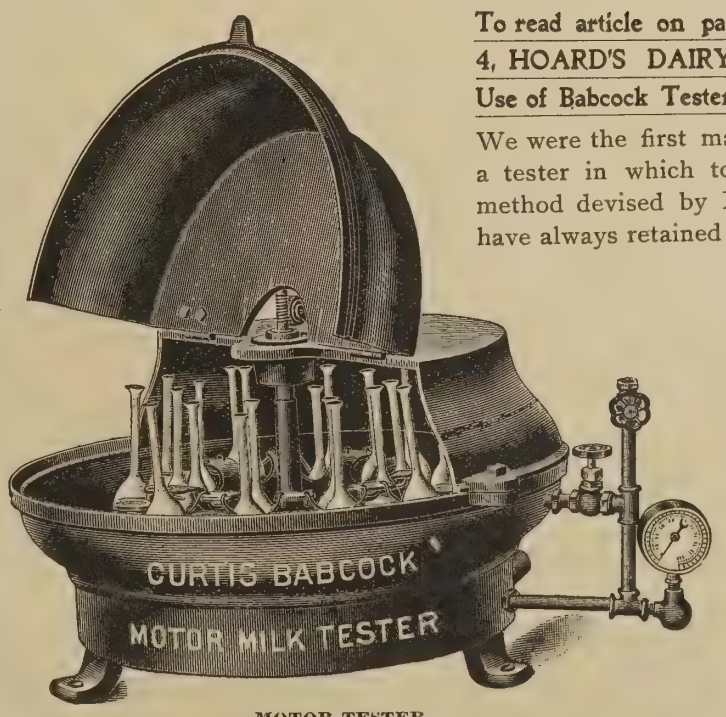
If your bowels are not just right, Ayer's Pills will make them so. Send for our book on Diet in Constipation.

Write to our Doctors.



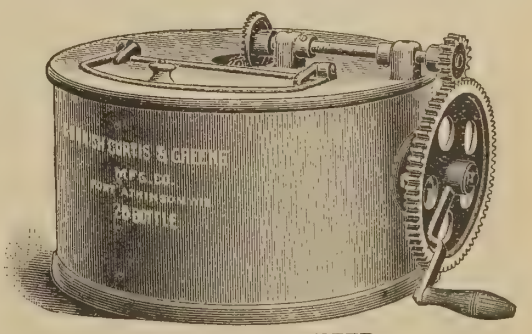
We have the exclusive services of some of the most eminent physicians in the United States. Write freely and receive a prompt reply, without cost.

Address, DR. J. C. AYER, Lowell, Mass.



Be Careful

To read article on page 488, issue of Aug 4, HOARD'S DAIRYMAN, regarding the Use of Babcock Testers in Cheese Factories.



We were the first manufacturers to make a tester in which to test milk after the method devised by Dr. Babcock, and we have always retained the first place in the list of manufacturers. The Farm Style, Factory Hand Style or Factory Motor Tester are the best made. Full descriptive catalogue, with directions for operating, free.

MOTOR TESTER.

FACTORY HAND TESTER.

CORNISH, CURTIS & GREENE MFG. CO., Fort Atkinson, Wis.

Agents for — *DE LAVAL ALPHA SEPARATORS.*

Inventors, Manufacturers and Dealers in Everything Pertaining to Butter and Cheese Making.

lic. To the rich it is not an important matter, but to our laboring classes in restricted or moderate circumstances, it is. Yet how often we find a mechanic's wife priding herself on her economy in purchasing but little milk, and then freely patronizing the butcher's cart at current prices. Even the families of the farmers who produce milk, often use it as an article of diet in very limited quantities."

There are farmers having large dairies in this town, now that four per cent milk is worth $1.20 per 100 pounds, on whose table a pitcher of milk is seldom seen, and scarcely enough is retained to color the coffee or tea. Yet they do not hesitate to indulge in the use of high priced meats, fruits and all the delicacies found in the markets.

When some of those who eat beef steak and drink beer are shown the error of their ways, and are made to see the superior food value of milk, over the other foods they consume, more of it in the form of cheese will be eaten. When that day arrives, we shall see cheese selling at profitable prices for the dairymen, just as it is now, owing to a short s pply.

The department of agriculture has decided to go for Armour's scalp, and will fight to a finish the oleo business. Commissioner Weiting has got up steam, and opened the throttle for the purpose of securing that $1,500,000 for violation of the anti-hogbutter laws of this state. A hearing was to have been held last week Tuesday at Watertown, before Judge Watts, who has been appointed referee. But an adjournment, by stipulation of counsel, who was not ready, was taken. The New York Central, West Shore and Delaware and Hudson railroads were subpœnaed to attend, and to produce their books for the purpose of ascertaining the shipments of hog butter by Armour & Co. into this state. No doubt the company will put up a big fight, as $1,500,000 is quite a "bundle" to play for, and it may be "many moons," and a number of "great suns" ere a finale is reached.

It is hoped, however, that Armour will have to go down deeply in his trousers, and be forced to settle, since the highest court has said that he repeatedly violated a constitutional statute. That being the case, and the number of violations of the law, amounting to that sum in fines, the gang should be made to put that up in lucre, instead of being let off for a beggardly $20,000, as was proposed by former Commissioner Schraub. "Let him pay his debts and come out," was the remark which that white-haired patriarch, Casby, made to Panks, when the incarceration of Arthur Clennam, in the old Marshalsea prison, for debts contracted, and which he could not pay, was up for discussion between those two worthies. Now let Armour & Company pay that little $1,500,000, provided they have the shekels.

Mr. Wieting has a very large blood microbe in both eyes and proposes to use it for the purpose of ascertaining the financial status of the Chicago hog butter patriots, and for forcing them to "pay their debts and come out;" and he'll do it too, unless the company buys up the high court, and prevails upon it to reverse its former decision. One can't most always tell what some of these high muck-a-muck judges will do now-a-days, as witness the reversal of a former decision, duly "handed down" by a certain judge of the U. S. A. highest court, and which so benefited the Vanderbilts, Rockfellers, Russel Sages, Goulds (not John), Hetty Greens, and some others, that they were enabled to shirk the payment of an income tax to help along this expansion scheme of ours now on, and which, but for that "Just Judge (?)" might have landed the whole gang in the poor house. It is not best to crow too much till after we have heard from the judges, and are safely out of the wilderness.

The silos are all completed, and most of them have been filled. Several of the round pattern are numbered among the new ones, one of them, Mr. W. R. Green's, having its fill of summer silage. It is the only summer silo, so far in town, but more will follow another year. Mr. Green has two silos well filled, and a five-acre surplus of corn besides. His crop was a success, because it was not only planted early, but well fertilized and cultivated. During the hot days of August, he kept the cultivator doing constant duty, and has now reaped his reward. It pays to keep the cultivator "teeth hot," as Prof. Roberts is wont to remark, when the terrible hot, dry, mid-summer days come. Mr. Green did that, but there are a whole lot of farmers who did nothing of the kind. Result: No corn. I saw four fields on one road, in a five-mile drive, one day last week, that have not been visited by a cultivator this season. We could see the tassels of the stunted corn stalks, standing on tip-toe and peering over the quack grass and weeds at us as we drove by, and we almost expected to hear them cry out: "Save us or we perish."

One of those fields is on a farm on which a silo was built three or four years since, but, if it is to be filled this year, more quack and weeds than corn, will go into it, unless the owner imports a corn crop. On another farm, where there is also a silo, the owner has abandoned it, seemingly, and has cut and put up his corn in very large shocks in the field. His silage venture, however, has, as a rule, owing to a defective silo, and other natural causes, been a failure, so it is not at all a surprise that he has abandoned his silo and embarked in the big shock make shift. And yet, the influence of such a man is more or less bad, from the fact that there are so many farmers, who are constantly looking for proof that the silo is an impracticable affair, and who, when they find a man who has abandoned it, no matter from what cause, are sure to magnify it at a great rate, and say: "We told you it was a humbug, now go and see for yourselves." And yet, new silos are going up on every hand, and more are to follow, but they are and will be on the farms of practical, up-to-date dairymen.

Speaking of the tub or stave silo and the liability of its contents to freeze, and thereby be greatly injured, Mr. L. A. Clinton, writing in the *Rural New-Yorker*, recently says: "It has generally been supposed that the freezing of ensilage in winter would injure it for summer feeding. During the past winter, we had occasion to examine ensilage which was stored in a stave silo, erected out of doors, with no protection whatever to keep the ensilage from freezing, except that afforded by the staves, which were two inches thick. The ensilage was frozen around the outside to the depth of six inches. This ensilage was not fed out until June, and that which had been frozen kept just as well as that which had not been frozen, and was, apparently, not injured in the least by the freezing. It thaws out slowly, when away from the air, and, without the presence of oxygen, there is no possible chance for it to decay or spoil. So, with the construction of these stave silos, we are led to believe that no protection whatever is needed to keep the ensilage from freezing.

For winter feeding, of course, the ensilage would not be fed while frozen, but, each day when the material is thrown from the silo, if that which is frozen is mixed with the warm ensilage from the center of the silo, in a few hours the whole mass will be in good condition for feeding. The silo should have a place on every dairy farm, and ensilage should be provided for both winter and summer feeding."

If Mr. Clinton is right in what he says, another problem is solved, *i. e.* how to prevent silage from freezing in the out door stave silo.

Several of these stave silos have been put up here and filled recently, and one man has enclosed his in a square building. Another man thought to so secure his, but, upon my showing him Mr. Clinton's article, decided not to do it. Had the other dairyman been a reader of the *Rural*, he would have been at least $25 to $30 ahead, saved by not enclosing his silo. Perhaps, however, it may pay to put a building around one, as a protection against the violent spring and early fall winds which lake Ontario so often dishes up for us. C. W. JENNINGS.

Belleville, N. Y.

The Escutcheon Theory.—Further Light Wanted.

ED. HOARD'S DAIRYMAN:—It is not many years since the escutcheon of a cow was considered one of the most important marks of a cow's value. In the last five years or so it seems gradually to have lost the importance it once possessed, until now one seldom sees anything about it in any of the dairy papers.

The opinion of most cattle judges seems to be that, while the escutcheon may indicate the milking qualities of a cow, there are other more evident signs that are safer to follow.

I have seen and bought a good many cows in the last five years, and I have never failed to observe the form and size of the escutcheon. The result is that I have come to the conclusion that it is a point of considerable value as an indication of a cow's capacity. I agree most heartily with the general principles which the editor so often expounds as to the dairy points of a cow, and I should probably hesitate to sacrifice any of these points to the escutcheon, but I believe I have seldom seen a cow with a perfect escutcheon that was not an excellent milker.

I should like to have this matter discussed by the readers of HOARD'S DAIRYMAN who have decided views for or against the escutcheon theory F. G. H.

Brookline, Mass.

A Note of Warning from the Indiana Experiment Station.

Upon the announcement of the United States Department of Agriculture that it had achieved success in the treatment and prevention of hog cholera by the new serum, it was predicted by the Veterinarian of the Indiana Station, that commercial firms would soon produce a "serum," and claim it to have all the merits of that produced by the Government. Neither experimental work or experience is necessary for cholera-cure firms to claim success. Recently, we have been informed that such firms are operating in Indiana, and as a result cholera is following in their path, and the disease being introduced into herds when it had not previously been in the neighborhood. The Indiana Station desires to learn of the success or failure of the hog cholera serum treatment in every locality in which it has been tried, and also of all outbreaks of disease which may have followed serum treatment, and we solicit correspondence upon the subject.

Reports have also been received that agents of cholera medicines in White, Warren, Pulaski and Fulton counties, claim authority to sell goods recommended by the Station, and agents in Marshall and Kosciusko counties claim to be agents of the State Board of Agriculture. All agents making such claims in any part of the state are frauds and should be prosecuted.

A. W. BITTING, Veterinarian.

Frauds by Dealers and Breeders.

The quickness with which commercial cunning catches up scientific methods, and uses them not only against science, but against society (for which science exists), is shown by a fact that has recently come to light. It is known that after an injection with tuberculin, cattle will not show a second fever reaction within a period of several weeks. In order to deceive inspectors and buyers, many breeders and dealers have been practicing the injections weekly prior to those of the buyers and inspectors, so that there is no fever reaction when the real test should show the existence in the animals of tuberculosis. This is really more infamous than the purchase of the testimonials by bribery from supposed reputable bacteriologists and experts, or the downright forgery of such testimonials—things that have more than once been proved. The law should make short shrift for such scoundrels. Another iniquity recently came to light by means of a blunder which brought quick and deserved retribution, but which also suggests an inquiry as to the possible number of instances in which bad results are hidden by a better technic. At a great agricultural fair a large number of valuable Jersey cows suddenly died while in the exhibition grounds. Investigation proved that to give a false appearance of "large bags," milk in quantity had been injected into the glands. The maladroits had failed to sterilize the milk, and the cows succumbed to septicemia.—*Philadelphia Medical Journal.*

DAIRY MARKETS.

ELGIN, Ill., Oct, 2.—Thirty tubs offered; no sales; committee reported firm 23½c.

CHICAGO, Ill., Oct. 2.—Butter—Slow sale; creamery, extra, 22½c; cold storage creameries, 20½@21c; firsts, 19@20c; seconds, 15½@16½c; imitation creameries, fresh, from unsalted butter, 15@16c; dairies, extra (Cooley's) 19c; firsts, including Cooley's 16c; seconds, 15c; ladles, 14@15c; packing stock, 13½@14c.

Porcelain lined, pure and clean. No filthy valves, no splashing over, no rust. Thousands in use. Round bottom and proper depth.

D. H. BAUSMAN,

Bausman, (Lanc. Co.) Pa.

Manufact'r Water Wheels, Tanks, Pig Troughs, Poultry Troughs, Etc.

FOR SALE

The finest dairy farm in Virgina. Situated 25 miles from Washington, D. C. on the Potomac River; Pa. Railroad running through and station on the place. The tract contains 1550 acres and is divided in four farms, two of which are dairies, one of them large and thoroughly equipped. These farms are peculiarly adapted to dairying, trucking, fruit growing, etc., and are very accessible to first-class markets with ready sale for all milk that is produced at high prices. The land is very fertile, level, well watered and about three-quarters in cultivation. Can be devided into half a dozen or more farms, and should be seen to be appreciated. Owner will sell direct cheap, the whole, or parts of from 100 acres up. For full particulars, address,

H. A. DAVIS,

631 Pa. Ave. N. W., Washington, D. C.

12¼c; new block No. 2,10@10¼c. Market strong; receipts 21,570 pounds; trade fair.

Eggs—Fresh, per doz. 16½c; loss-off cases returned. Market firm, receipts 309 cases.

FOND DU LAC, Wis, Oct. 2.—Offerings 635 Twins and 580 Dairies; market active at 11½c for Twins and 11¾c for Daisies.

PLYMOUTH, Wis., Sept. 26—Sales to-day 1,225 Twins at 10¾c and 1,335 Americas at 11c. Market active.

BRILLION, Wis., Sept. 22—Sales of cheese to-day, 1,800 Daisies at 10½c; 850 Flats at 10½c; 510 Young Americas at 10¾c.

MUSCODA, Wis., Oct. 2.—Offerings on the Board to-day were 1,300 Twins; market active and all sold at 11c.

HILBERT, Wis., Sept. 23—The following sales of cheese were made to-day: 110 cases Young Americas at 11⅛c and 100 Daisies at 10¼c.

APPLETON, Wis., Sept. 21—The offerings to-day were 220 Cheddars and 324 Twins. Bids on Cheddars, 10⅞c; Twins, 10¾c. Sales 165 Twins at 10¾c.

HORTONVILLE, Wis., Sept. 21—Offerings were 160 Cheddars and 1,165 Twins. Sales: 123 Cheddars at 10¾c; 180 Twins at 10⅞c; and 729 Twins at 10¾c. Ruling prices: Cheddars, 10¾c; Twins, 10¾c.

SHEBOYGAN FALLS, Wis. Sept. 27—Seventeen factories offered 1,442 boxes of cheese on the call board to-day, and all were sold as follows: Seven hundred and sixty cases Young Americas at 11¼c; 107 Twins at 10⅞c; 175 Daisies at 11⅜c; 100 at 11¼c; 100 at 11⅛c; 200 at 11. Market active.

MANITOWOC, Wis., Sept. 27—Offerings on the Dairy Board of Trade to-day were 850 boxes Daisies, 175 boxes Twins, 700 boxes Young Americas. All offering of Daisies and Twins sold at 10½c; Young Americas at 10¾c.

NEW YORK, Oct. 2.—Butter—24c for western creamery; 21@22c for state dairy, half firkin tubs finest.

Cheese—11¾c for State, large, full cream, colored fancy.

Eggs—20c for western first, loss off.

FULTON, N. Y., Sept. 25—To-day 17 factories were represented with 1,035 boxes of cheese. Large sold at 11c and small at 11¼c.

CANTON, N. Y., Sept. 25—Saturday 1,900 boxes of cheese were sold here at 11¼c and 800 tubs of butter at 23c.

OGDENSBURG, N. Y., Sept. 25—On the board Saturday 1,427 boxes were offered. A bid of 11½c resulted in no sales, but later on the street sales were made at this price.

NORWICH, N. Y., Sept. 25—The sales were 300 boxes of small colored creams at 10¾c; 160 boxes of white creams at 10¾c and 432 boxes of skims at 9c. Creamery butter sold for 22c and dairy at 20c.

WATERTOWN, N. Y., Sept. 25—The sales of only three lots, 150 boxes, were reported, these going at 11c. On the curb the sales were: Large white, 175 boxes, at 11½c; 300 boxes at 11¼c; 890 boxes at 11⅜c, and 2,745 boxes at 11½c; Twins, 190, at 11½@11¾c.

UTICA, N. Y., Sept. 25—The market was fairly active, with the tone a little firmer. The sales were not very large, from 11⅛@11½c. The shortage in milk supply continues.

Following is a list of sales as officially reported: Lots, 106; boxes, 8,329; price 10¾@11½c.

The transactions on Sept. 27, 1897, were 8,208 boxes with 8⅝c the ruling price. The transactions on Sept. 26, 1898, were 6,238 boxes with 8c as the ruling price.

The butter market was fairly strong. The sales were 17 packages at 22c; 90 packages at 23c; 25 cases of 1-pound prints at 25c; 35 cases of 5-pound prints at 25c.

LITTLE FALLS, N. Y., Sept 25—The market gave some indications of a firmer condition which it is believed will still further improve.

The sales were 4,276 boxes at 10¾c@11c, nearly all going at 11c.

Light sales of butter are made, generally at 22c for a prime article. In a few exceptional cases it is reported that 23c has been paid.

PHILADELPHIA, Pa., Oct. 2—Butter—Solid packed, separator creamery, extra, 23c; creamery, firsts, 21@23c; seconds, 18@20c; imitation creamery, extra, 19c; firsts, 16c; seconds, 14c; ladle packed, extra, 16c; firsts, 15c: seconds, 14c. Print Butter—Creamery, extra, 24c; firsts, 23c; seconds, 19@20c.

Eggs—Pennsylvania and nearby, 19@19½c; Southern, 17c; Southwestern, 18c. Western, 19c.

BALTIMORE, Md., Oct. 2—Butter—Market firm; creamery, separator, extra, 24@25c; extra, firsts, 23@24c; creamery firsts, 22@23c; creamery imitation, extra, 19@20c; ladle, extra, 17@18c; Western store-packed, 13½@14c.

Eggs—Market firm; strictly fresh stock, 16½@17c.

ST. LOUIS, Mo., Oct. 2—Butter—Steady; creamery, 19@23c; dairy, 15@18c.

Eggs—Steady; 15c.

KANSAS CITY, Mo., Oct. 2—Butter—Creamery, 19@21c; dairy, 16c.

Eggs—Fresh, 15c.

CINCINNATI, O., Oct. 5—Butter—Dull.

Cheese—Firm; good to prime Ohio flat, 11½c.

Eggs—Steady; 15c.

BOSTON, Oct. 2.—Butter—Creamery extra, 23½c; western extra, 23c; dairy extra, 21c; imitation creamery, 16@17c; western ladle, 15½c; print creamery, 24½c; box creamery, 23½c.

Eggs—Fancy near by 25c; choice fresh 20@21c; Michigan extra, 19c; western 18½c; fair to good 16@17c.

WASHINGTON, D. C., Oct. 2.—Market firm; extras, 24c; choice firsts, 24o: fine imitations, 19c.

NEW ORLEANS, La., Oct. 2.—Butter firm; fine creamery scarce, 24c; prospects higher; ladles active.

Eggs—17@18c.

NEWARK, N. J., Oct. 2.—Market steady; 24c for strictly Elgin only.

Latest quotations for fancy creamery: Buffalo, 23c; St. Paul, 22c; Minneapolis, 22c, Detroit, 23c.

NEW YORK MARKET.

NEW YORK, Sept. 29—Butter—Receipts for the week were estimated at 25,885 packages.

Exports for the week were estimated at 2,988 packages.

Arrivals of fine, fresh creamery makes just barely supplied the demand; regular business transactions were interrupted by Holiday observances. The first half of the week, there was a hurried succession of small trading, and the last half of the week business was entirely suspended.

The trade are using more natural colored butter than they used to; it has a growing preference among buyers. We quote:

Creamery, extra, 23c; medium, 20@21c; poor, 16@18c. Dairy, extra, 22c; medium, 18@20c; poor, 15@16c. Ladle, extra, 16½c; medium, 15@15½c; poor, 14@14½c.

Cheese—Receipts for the week were estimated at 23,686 boxes.

Exports for the week were estimated at 9,475 boxes.

There is a firm, strong market well sustained by export demand and clearing sales of everything offered at going rates. The trade are laying by cheese for their winter wants which more or less limits the offerings, and altogether the market closes firm. We quote:

Full cream, large, extra, 11½@11¾c; medium, 10½@11c; poor, 8@9c. Full cream, small, extra, 11¾@12c; medium, 10½@11c; poor, 8@9c. Part skimmed, extra, 10@10½c; medium, 8@9c; poor, 6@7c. Skimmed cheese, poor, 4@7c.

Eggs—Receipts for this week were estimated at 52,610 cases.

There is a quick demand for all fresh laid stock and even refrigerator goods well held are in request as high as 18c. We quote:

State & Pennsylvania, per doz., 20@21c; Western, fancy marks, per doz., 20c; Western, regular packings, per doz., 19@20c. DAVID LEWIS & Co.
177 Chambers St.

BALTIMORE MARKET.

BALTIMORE, Sept. 28—Butter—The receipts of separator creamery this week have been about equal to the demand, and that has been practically limited to the consumption here and, in contiguous cities and towns; it is fully expected that if the weather settles, and the temperature remains cool, that the orders will materially increase, and then unless there is a corresponding gain in milk at the creameries regularly contributing to this market, there will be further requisitions upon the freezers, and they contain some very high grade goods, and seem to be an ever present aid in time of need, especially after the enhanced values have driven off the foreign trade, as is now the case; by-the-by, continuing our thoughts for a moment in the freezers and on the lines of butter therein contained, the question presents itself: Who will want it when the Australian and New Zealand surplus stocks flood the English and continental markets next month? Just at this writing, much of the stored creamery is of the qualities that closely compete with the gathered cream products of present make, and the grading of much of the latter is so low, that the well saved goods, though not fine when put into the freezers for their salvation, appear much better by comparison, and better even than when they were stored. Imitation creameries, both fresh and storage stock, is very scarce, and in good demand. Ladle packed goods are in very light receipt; all grades are wanted. The receipts of store packed also, are unusually light, and there is quite a lively competion among buyers for the limited quantity on arrival. There is more inquiry for rolls, and a disposition on the part of the market house trade, to pay prices in excess of quotations; we think 16c a very conservative price.

Creamery Separator, extras, 23c; firsts, 21½@22c; seconds, 19@20c. Gathered Cream, extras, 20@21c; firsts 18½@19c; seconds, 18c. Ohio, extras, 20@21c; firsts, 18½@19c; seconds, 18c. Imitation, firsts, 16½@17c; seconds, 15@16c. Iowa & N W. Ladle, firsts, 15@16c; seconds, 14c. Ohio & Indiana Ladle, firsts, 15@16c; seconds, 14c. Ohio Storepacked, firsts, 13½@14c: seconds, 12½@13c. W. Va., firsts, 13½@14c: seconds, 12½@13c. Creamery Blocks (2 lbs.) extras, 24½@25c; firsts, 23@24c; seconds, 21@22c. Prints, (½ lb.) extras, 24½@25c; firsts, 23@24c; seconds, 21@22c. Md. Va. & Penn Prints, extras, 20c; firsts, 19c. seconds, 17@18c.

Cheese—Receipts fair; demand active; market firm.

N. Y. State Cheddars, fine, 12@12¼c; choice, 11½@11¾c; fair, 10½@10¾c. Flats, fine, 12¼@12½c; choice, 11¾@12c; fair, 10¾@11½c. Small, fine, 12½@13c; choice, 11¾@12½c; fair, 10¾@11½c. Ohio Flats, fine, 11¾@12c; choice, 10¾@11½c; fair, 10@10½c. Picnic, fine, 11¾@12¼c; choice, 11@11½c; fair, 10½@10¾c. Swiss Cheese fine, 12@13c; choice, 11@11½c; fair, 10@10½c.

Eggs—Under continued light receipts of all strictly fresh eggs, and an active demand, our market rules firm and strong at 16½@17c. We advise liberal shipments, as you will find with the fair grading in our market, that our prices will compare favorably with our sister markets.
301 Exchange Place. G. M. LAMB & Bro.

LIVERPOOL, Oct. 2.—Butter—Finest United States, 95s; good, 72s.

Cheese—American finest white, 52s 6d; American finest colored, 54s.

MANCHESTER, Eng., Sept. 23:—The Danish official quotation has been again advanced four kroner. This price covers faultless quality on which the quotation is based. Premiums are not infrequently paid for the best dairies, as however, all free on board butter is shipped as faultless—whether it actually be so or not—the rise will cover all butters invoiced direct. In the United States extra creamery is now about three cents higher than last year at this time. The higher price now is justified by the lighter make reported from about all points and the general prosperity of business everywhere in the United States. In Great Britain the colder weather reaching to chilliness has improved qualities and consumption, and a brisk trade has been done during the week. Some small arrivals of Australians have reached London, mostly old and partly new seasons make. The best quality has realized 118s to 120s. Manchester received 4,080 casks of Danish and Swedish last Tuesday, being 263 casks less than the previous week. They changed hands at from 128s to 130s. Contract dairies full price. Irish creameries realized 116s to 125s, Finnish 116s to 118s, with Canadian s 110s to 112s. Irish firkin butter meets with a good steady demand at steadily advancing prices. Higher figures will be easily made next Tuesday. The market is quite bare and absolutely cleared of choicest qualities. 17,291 cases of Danish and Swedish are notified for this coming week's arrival, being 252 more, whilst Finnish total 1,346 casks or 417 casks less. Finland shipped for last week 1,804 casks to England and 2,085 to Denmark. A good steady demand for margarines and mixtures, consequent upon high butter prices. DOWDALL BROTHERS.

READING NOTICES.

All Reading Notices under this head are at the rate of 25 cents per line.

Wnnted—First-class hand separator for 10 to 15 cows. Must be in good order and cheap. C. C. McDERMID, Battle Creek, Mich.

Via the North-Western Line, will be sold at reduced rates, from certain stations on specified dates. For rates, dates of sale and limits of tickets apply to agents Chicago & North-Western Railway. 22-sp

To California, via the Midland Route.—Every Friday night, at 10:35 p. m., a through Tourist Car for San Francisco, carrying first and second-class passengers, leaves the Chicago, Milwaukee & St Paul Railway Union Passenger Station, Chicago, via Omaha, Colorado Springs and Salt Lake City), for all points in Colorado, Utah, Nevada and California. The Tourist Car berth rate from Chicago to San Francisco is only $6.00, and the sleeping car berths should be reserved a few days in advance of departure of train. Through tickets and sleeping car accommodations can be secured from any agent in the east, or by applying at the Chicago, Milwaukee & St Paul Depot or City Ticket Offices in Chicago. Send for our free illustrated California folders. Address Geo. H. Heafford, General Passenger Agent, Chicago, Ill. 29-sp

Prosperity is here.—Anyone who doubts it can be convinced by visiting any of the towns in western Iowa or Minnesota on the new lines of the Chicago & North-Western Railway. People in the immediate vicinity of these towns are quick to see the advantage and are already in advance of the railroad, building stores, residences, elevators, lumber offices, etc., etc., but there is room for more. The country is splendid, and will in all cases amply support all lines of business and trade, and in the most of the towns the best locations are still open. Lots in any of these towns cannot help but be safe and paying investments, as they are still on the market at the original low prices. For particulars address, J. F. Cleveland, Land Commissioner, Chicago & North-Western Railway, Company, Chicago. 34-2

Half Rates to Portland, Ore., Seattle and Tacoma, Wash., Via the North-Western Line. Excursion tickets will be sold at one fare for round trip from all stations, October 12 to 15, inclusive, limited to November 16, 1899, account of W. C. T. U. Convention at Seattle. Variable routes, delightful scenery. Apply to agents Chicago & North-Western R'y. 34-2

Protect Your Feet From The Cold and Wet.

All Knit "BALL-BAND" WOOL BOOTS, are the best.

They are the most comfortable and will wear twice as long as others. "Ball-Band" Socks and Rubbers are the same high quality as the All-knit Boots. They have superior features not found in others. Be sure that the trade-mark "Ball-Band" is on every pair. There are more imitations and counterfeits this season than ever before. We make all our own rubbers and are not connected in any way with any Trust. Insist upon getting "Ball-Band" goods from your dealer and take no others said to be "As good as," etc. Mishawaka Woolen Mfg. Co., Mishawaka, Ind.

Prepare for Winter.

Now is the time to think about keeping your stock warm during the coming winter. Before cold weather sets in look over your out buildings and see if there are any leaky roofs, any shingles or clapboards coming off, or any cracks that need stopping up to make the buildings warm.

It is poor economy to have cows and horses sleep cold in the winter, and every farmer knows how much more profiable hens are, and how much faster the chickens grow if they are kept warm.

If you will accept a suggestion from us, of which the editor of this paper will approve, you can fix up your old outbuildings, prevent leaky roofs, make warm your sheds, barns, hen houses, hot beds or green houses at very little expense.

Go to your nearest hardware dealer and get a roll of **Neponset Red Rope Roofing,** which is made for any outside covering, and is

postively water-proof, wind-proof, and frost-proof. There are five hundred square feet in each roll, and it will only cost you $5.00 including the necessary nails and tin caps.

Don't confound **Neponset Roofing** with common tar paper, which, when exposed to the weather will crack, crumble and quickly rot away.

Tar paper was all right for your grandfathers, but in this age of advancement a covering which is very much more durable and economical is required, and that is **Neponset.** It takes the place of shingles or clapboards on outhouses, and back-plaster in dwellings. Any one can put it on and it will last for years.

If you would like to have a sample of this Roofing and full particulars before you buy, send a postal card to **F. W. Bird & Son, East Walpole, Mass.,** and they will send it to you by return mail free.

INFORMATION WANTED.

It is impossible to get too much information regarding the breeding and testing of the dairy cow. Every year brings a new lot of dairymen, and, also, a new crop of calves, which should be fed, milked and bred in a manner to give the largest returns. In many cases the returns will be satisfactory; others, through want of the right kind of knowledge, have not made the success which they anticipated. From both classes much valuable information can be derived; to know where and how one has failed is as valuable, as to know why another was successful. We shall be glad, therefore, if a number of the readers of the DAIRYMAN, and the larger the better, would send us answers to the following questions, taking care to give their failures as well as successes:

1. Have you tested your herd, by weighing the milk and the Babcock test, to find which were the poor cows?
2. How long did you test, and how many did you reject? (Give the whole number of the herd at the beginning of the test.)
3. Is it much trouble or expense to do this, and what plan did you pursue?
4. Have you ever taken a herd of common cows, placed a registered sire at their head, and so kept up the system, until you brought out of it a herd of grade cows?
5. What was the breed you selected, and how much more butter, cheese or milk did you get from the daughters than the original mothers?
6. Would you advise changing breeds, one after another, or breeding right along in the same line?
7. Have you ever bred the daughters back to their own sires, and if so, what was the effect on the health and dairy capacity of the grand daughters?

NOTE—We want as many short, brief answers to the foregoing, from as many different men as possible. Make the answer to each question short as is possible; simply state the facts, not opinions. Do not worry about the style or grammar of your statement. Answer each question by number, and state your experience.

Seasonable Notes From Michigan.

Drouth—Poor Butter—Oleo Law in Michigan—Tuberculin Testing—Keeping up the Cows—Feeding.

ED. HOARD'S DAIRYMAN:—Since my last writing to your paper Michigan has passed through a very severe drouth, although I am happy to be able to record that rain has now quite generally fallen over the entire state.

August was a most trying month for dairymen as well as for farmers generally. Not only did pastures become burned past all vestige of green, but wells and creeks dried up so that in many localities water had to be hauled for miles, not only for stock but for household purposes.

As a result, milk became exceedingly scarce, butter went up with a bound to twenty-two cents a pound (where it stands at the present time with little or no chance of decline) and milk at retail advanced one cent per quart. At creameries and cheese factories the amount of milk delivered dwindled to surprisingly small quantity per cow. In fact, this drouth has cost farmers thousands of dollars in diminished yields of late crops and dairy products. Corn never promised better than the early part of the season, yet even that cared for best suffered, and the ears did not develop as they would otherwise have done. Fruit was also injured and most of the apples, pears, etc., fell to the ground long before maturity.

Butter has commanded better prices here this year than it has in a long time. At no time has dairy butter fallen below a shilling a pound, whereas some seasons it has brought as low as ten cents, and even less during the flush of May and June. Eggs, too, have been higher than usual. In fact, the season so far as prices are concerned, has been one to make the farmer's wife rejoice, for out of her butter and eggs she has made a better profit than usual.

In a grocery store the other day I saw a lady buying butter,—or rather she was trying to find some which she wanted to buy. The price was twenty-two cents which certainly ought to entitle one to a pretty good article. There were a number of specimens of good flavor and color, but so salted as to render it about impossible to eat. There was none in the store which combined good flavor, color and a proper amount of salt. I like butter that is pretty well salted myself, but we draw the line at the point where it will grit between the teeth. We want it all to dissolve when acted upon by the moisture of the butter globules.

The recent action of the Supreme Court of Michigan in knocking out the principal part of the oleomargarine law of 1897, shows once again how difficult it is to make a law that will stand law. The Court held that there was a defect in the title to the act prohibiting the sale of colored oleomargarine. Food Commissioner Grosvenor had entered complaint against a dealer at Ann Arbor for selling oleomargarine colored to imitate butter. Now the Supreme Court says that until the Legislature formulates a title that shall be broad enough to include the sale of the stuff, when colored with harmless matter, its power to prohibit, is inoperative. The wording is: "To prevent adulteration, fraud and deception in the manufacture and sale of articles of food and drink." This decision is counted as a victory for the oleo men.

Tuberculin testing is getting to be quite common now-a-days. The retail milk men are beginning to realize the importance of this and we now have at least one wagon on the streets of our county town which bears a placard; Milk from Tuberculin Tested Cows. Surely the time must speedily come when all milk offered for sale can be thus guaranteed. It is no more than the milk buying public has a right to demand.

While it may be true that direct contagion to man by reason of using milk or meat from tuberculous cattle has not been incontestibly established, still it is not pleasant to consider the matter in the light of a possibility. Every precaution should be taken to prevent anything of the kind.

The cows ought to be in the stable every night now. They will give more milk if kept from contact with the ground these frosty nights.

It pays to keep all our stock comfortable, and it is a poor policy to leave calves or milch cows out in bleak fall winds or storms of rain and sleet.

When a man shivers with cold he is not comfortable, neither is an animal. Cows and calves are particularly sensitive to cold, as also are colts and horses. The merciful man is merciful to his beast. It is not merciful to leave stock out in cold winds and storms late in the autumn, as is frequently done. It requires so little labor to put them under shelter.

See that all the stables are in readiness for use in ample season. Then when a cold storm comes on, as is so frequently the case at this season, it will be an easy matter to run them in.

Shrinkage in milk will be a certain result of exposure to cold rains. Often cows are allowed to roam barren pastures late in the fall when they might far better be in the barn. There is nothing gained, rather actual loss is involved, when cows are expected to forage for a living on frost bitten and scanty herbage.

I very much doubt if it pays to "scrimp" the food of any animal, or human being either. Surely milch cows and growing stock, as well as sows suckling pigs, or brood mares with colts at side, need plenty of good nourishing food. The man who withholds this is guilty of gross neglect, not to say cruelty, the results of which will certainly be visited upon himself in the end.

W. C. ROCKWOOD.

Importance of Ventilation.

ED. HOARD'S DAIRYMAN:—I enclose you with this, a letter from one of your subscribers, Mr. A. E. Rundell, which contains some very valuable statements, illustrating the importance of ventilation of cow stables, and I hope you will print it for the benefit of other readers. F. H. KING.

Madison, Wis.

Your favor of 19th inst., relating to ventilation of my barn, is at hand. One year ago I built an addition to my basement barn, the size being 48×52 feet, and will accommodate eleven horses and twenty-five cows. In the horse department there is ten feet between floors, and nine feet where the cows stand.

In providing for ventilation, your suggestions were carried out so far as convenient. I purchased twenty-two tubes of galvanized iron, four inches in diameter and four feet long, with elbow at each end. Those tubes were built in the stone wall, with lower elbow opening out, and upper end inward.

Near the center of the barn we have a ventilator and hay chute combined, about 3½ feet square and forty feet long—opening into cupola on ridge of barn roof. The lower end of chute is located between two cows; the sides of chute next the cows are boarded up close; two narrow doors on each side, reaching within eighteen inches of the floor, closes the other two sides of chute.

One cold day in early winter, the stable being filled with stock, doors and windows all closed, I was at work making and hanging ventilator doors. I had been at work but a short time, before I felt sick at the stomach, and with difficulty kept from vomiting. I left my work to attend to other chores, and had been in the open air but a few minutes when those disagreeable feelings disappeared. The next morning upon resuming my work on the ventilator, those nauseating feelings returned. I then saw the benefits of ventilation, for I realized all the foul odor of the stable was coming my way and passing up the ventilator.

Several times during the winter, I stood in the ventilator shaft, and found the air very foul. In order to keep the stable sufficiently warm during cold weather, we found it necessary to close some of those fresh air tubes. Once during a very cold spell, we closed all the tubes, and a strong draft came down the ventilator.

The front of the manger, each side of the ventilator, is boarded up close, 2½ feet above the floor. One of the cows standing next to the ventilator was of a bulky tendency, and was nearly dry by spring. The other cow freshened in September; gave a large amount of milk until midwinter, when she suddenly refused to eat much, and dropped off fully two-thirds in her milk supply.

We attributed this to over feeding. After a time she regained her appetite, but did not regain her former flow of milk. She recently calved again, and is now doing well. I have wondered if the cows standing near the ventilator might not be affected by the foul air moving from all parts of the stable toward the ventilator shaft.

The air in our stable, except near the ventilator shaft, is always quite pure. I hope farmers, especially dairymen, will profit by your suggestions, and properly ventilate the dwelling place of their herds.

Our silo is giving the best of satisfaction. If I can give you any further information I shall be pleased to do so. Thanking you for past favors, I am yours truly.

Grant Co., Wis. A. E. RUNDELL.

A Remedy for Rats.

ED. HOARD'S DAIRYMAN:—I notice in your valuable paper that C. S. Stillman, of Middlesex Co, Mass., asks for a remedy to get rid of rats on his premises.

The best method, I have found, and it has proved to be successful with me, is to mix corn meal and plaster of Paris together, about one-third plaster of Paris. The rats will eat the corn meal, also some of the dry plaster. As they pick the corn meal out, add a little more meal to it, and mix it together, put it in shallow dishes and set it around in different places. Also have some water convenient for them to drink. And in three or four days he will not be troubled with rats. A good feature of the mixture is, it is not poisonous to other larger animals. I have had some of my cows clean the dishes sometimes, and it did not hurt them in the least.

Dodge Co, Wis. THOMAS STEELE.

A Low Wagon at a Low Price.

In order to introduce their Low Metal Wheels with Wide Tires, the Empire Manufacturing Company, Quincy, Ill., have placed upon the market a Farmer's Handy Wagon, that is only 25 inches high, fitted with 24 and 30 inch wheels with 4 inch tire.

This wagon is made of best material throughout, and really costs but a trifle more than a set of new wheels and fully guaranteed for one year. Catalogue giving a full description will be mailed upon application by the Empire Manufacturing Company, Quincy, Ill., who also will furnish metal wheels at low prices made any size and width of tire to fit any axle.

It is Easy

for you to detect tuberculosis in your cattle by the use of

Detroit, Mich.

DEWEY AND THE "ALPHA."

The Whole Country echoes with the unparalleled magnificence of the welcome accorded Dewey and his gallant men on their home-coming. The whole nation is doing joyous homage to the great chieftain of the seas.

(ADMIRAL DEWEY AND THE OLYMPIA.)

But Peace also hath her victories, and the deeds of the valorous Admiral suggest some feats of the De Laval Cream Separators in their sphere of usefulness.

Just as Dewey on that glorious May morning revolutionized the map of the world, so the invention of the De Laval separators revolutionized modern dairying.

Just as the shots that broke the backbone of Spanish oppression reverberated around the world, establishing enduring respect for the American flag in every civilized country, so has the fame and prestige of the De Laval separators become equally wide in helping to establish prosperity in every dairying community throughout the world.

Just as the peerless Dewey and his superior fighting machines swept everything before them at Manila, so the peerless "Alpha" De Laval separators—through their superiority in every feature of separator practicability—have overwhelmed everything else in the separation of cream from milk.

Invention and industry, indeed, have their triumphs and leave their impress upon human progress as well as the lordlier strife of war.

Oleomargarine and the Consumer.

ED. HOARD'S DAIRYMAN:—I am not now a subscriber to your paper for I have had no personal interest in cattle for many years, but after closing out all interest in cows I ordered your paper to my tenant succeeding to the dairy cattle business and renting the farm. I have "promoted" for your paper in a few other instances. So I do not appear before you with my personality now, as I am at present only a quiet, retired citizen. In lieu of my personality you may notice a subject.

In your just war against oleomargarine, butterine, etc, you and other similar journals make this the main cause: That the manufacturers of said stuff can impose upon dealers and thus cheat and defraud them of their money, and you wish laws which will protect the purse of the traders, by having packages stamped so and so.

Now to protect these shopmen from getting this stuff in their hands at a price above its real value by having it put to them as butter, seems to be the main object of the war, and if the shop-keepers be not imposed upon by the manufacturers the object of the war will have been accomplished.

After that is done, it will be perfectly right for all who keep public houses, hotels, restaurants and boarding houses to buy the stuff as it is from the dealers; both so far will be clear of fraud on either part. The dairyman would be protected, likewise the groceryman, and the last buyer, the hotel or boarding-house-keeper. But, there is a greater injury than these tradesmen's money involved and which the special journals seem to be indifferent about.

Do you think the thousands of men, women and children, who eat and live at such houses, should go unprotected and be imposed upon by the landlords and landladies setting this stuff before them for butter?

If the margarine is nasty, bad and unhealthy, it is greatly more important to prevent it being fed at all to people, than saving shop keepers from being defrauded, for they are far more able to protect themselves commercially than the consumers at the table; to these is where harm, hurt and fraud is finally done, if the stuff is bad and unfit food.

Yet it seems the journals' contention is to protect mainly, buttermakers and dealers, and the money, and not the health of consumers, who cannot often tell or know the fraud they have eaten.

The journals of the country should take a higher stand than aiming at protecting the pockets of dairymen, grocers and landlords, if they be allowed then to impose upon unknowing men, women and children at their tables.

Can't you pitch your axe so as to reach the bottom root of the evil?

All city boards of health jump on a milkman if milk below the standard is found in his wagon. Although it may be pure milk, he will be fined and his milk thrown away. Beautiful consistency this, isn't it?

After paying a $50 fine, the milkman walks from the city court room and as he can't get back home to dinner, goes to a restaurant or boarding house, and there has set before him to eat, butterine. This will cultivate his patriotism. Will it? An example to practice high Christianity, being smitten on one cheek, to find a hand ready to strike upon the other, and secure it or not attack it.

Nashville, Tenn. AN IDEA.

Our correspondent has struck the key note to the situation, and if he had continued his reading of HOARD'S DAIRYMAN, he could not have failed to observe that it at least had been instant and consistent in keeping this phase of the subject at the front.

It is no protection to the great mass of consumers that the package is labeled oleomargarine—there is no such substance as *butterine*, and the use of such a word is in itself an attempt to deceive and defraud—or that the dealers have signs posted about their premises.

The effort which is to be made at the coming session of congress, to have all colored oleomargarine taxed ten cents per pound, is primarily in the interest and for the protection of the consumer. It is expected that a tax of this amount will serve to make it inexpedient for manufacturers or dealers or boarding-house keepers to attempt to deceive by serving oleomargarine when butter is wanted. They do it now and get butter prices for it, thereby reaping a fraudulent profit. With the tax imposed there will be less incentive to do this, and when the incentive to deceive is removed, it is reasonable to expect there will be less deception.

We are by no means indifferent to the benefit which will naturally accrue to dairymen when relieved of this unfair and fraudulent competition. If there was no law against counterfeits and frauds anywhere or on any subjects, what chance would honest men have? The dairymen do not demand class legislation, but simply the protection which every government owes to its every citizen—the right to have their products defended by law against the lying and cheating of the vendors of counterfeits.

Under the interpretations put upon the federal constitution by courts it seems impossible for the states to do this. They can, indeed, forbid the making of oleomargarine within their own boundaries, but a man may make it in a neighboring state and ship where he pleases. Thirty-three states have passed laws prohibiting the sale of colored oleomargarine, but despite these laws the manufacture and sale of oleomargarine is rapidly increasing. If Congress does not provide some protection and relief there will simply be a revolution, not with gun and sword, but with that more mighty weapon, the ballot. Consumer and producer alike are interested and they will combine to drive into retirement and disgrace the men and the parties who fail to give them protection.

Existing laws, as currently interpreted by courts, protect a few manufacturers and dealers in oleomargarine, but leave the people absolutely defenseless. This is class legislation of the worst kind and there must some remedy be found.

Exhibiting and Judging Live Stock.

Now that the smoke of the battle has cleared away and the strife in the show ring for 1899 is over, it may be well to enter into the retrospective a little and find out just where we are at. The contests in nearly all classes of live stock at this year's shows have been very keenly contested, more so than for several years back, especially in the cattle, sheep and swine classes. So much so has this been the case that the most despicable practices have been resorted to, in a couple of instances, in order to gain favor in the prize ring. And, indeed, we may well ask: "Where are we at?"

The contemptible action of the manager of the Miller & Sibley herd, and apparently of those in charge of the herd of a prominent Canadian breeder, in forcing back the milk into the udders of their Jersey cows before taking them before the judges at the Toronto Fair, cannot be too strongly condemned. When exhibitors at any show resort to such practices they should be prohibited from ever entering a show ring—at least until they have learned that honesty in the show ring is just as necessary and is as much looked for as in any business transaction.

The action of the Industrial Fair Board, in withholding the prize money won by the Miller & Sibley herd and in restraining them from exhibiting at the Industrial Fair for one year, will be generally commended. But what seems strange is that no punishment has been meted out to the other breeder implicated. Those responsible for the action referred to in this case were either innocent or guilty. If the latter, why was not the same punishment meted out to the Canadian firm as to the American firm, whose manager admitted the wrong-doing? If the Canadian breeder was totally innocent of the charge made against him it is only fair to himself and to the public that the fact should be made known.

It is somewhat strange how this affair is developing. In a letter to the president of the Industrial Fair Association made public last week, Messrs. Miller and Sibley state that they were greatly shocked on learning that one of their employes had resorted to the

ALBION JERSEY HERD is headed by
Pedro's Prince Phillis 42298,
An **Ideal Dairy Sire,** carrying 75% of the blood of **PEDRO 3187.**
R. C. GREEN, Albion, Wis.

THE LOSS OF AN EYE —terrible calamity. The tip of a horn often does it in tying up cattle. Cut off the horns quickly and humanely with the ***Keystone DEHORNING Knife*** Cuts on four sides, no crushing or tearing. **Highest Award World's Fair. FULLY GUARANTEED.** Write at once for descriptive circulars, prices, etc.
A. C. BROSIUS, COCHRANVILLE, PENN.

practice already referred to, and would forego all prize money, honors and success unless they were justly entitled to them. While we have no desire to question their sincerity in this matter, yet it seems strange that they should have as the manager of their large and valuable herd a person who would stoop to such methods. Their manager is not a novice in the business of managing a Jersey herd, and it is hardly reasonable to suppose that his visit to the Industrial Fair a few weeks ago was the first time when milk had been forced back into the udders of their cows before taking them into the show ring.

This particular instance, to which we have referred at some length, however, suggests a thought that it might be well to consider for a moment. Just how far an exhibitor should go in fitting and fixing his animals for the show ring and how far the judges should be governed by such preparation in awarding prizes is open to question. Is an exhibitor who has a superior animal, constitutionally speaking, to be put down in the prize list because another animal inferior in other ways, but specially fitted for the show, takes the eye of the judge and is placed first? Every one will admit that a certain amount of fitting is necessary not only for the show ring but in order to make an attractive exhibit for visitors, but how far its influence should extend in awarding the prizes is another matter. Certain it is that a well-fitted animal looking sleek and nice, and not a hair turned the wrong way, will take the eye of the judge and unless it has some very glaring defect otherwise will not be passed over carelessly by him.

While we believe that a certain amount of fitting up is necessary, still we are somewhat inclined to the view that of late years there has been a little too much fitting and fixing for the judge's eye rather than for the visitor to the fair. In this we do not think the exhibitor is so much to blame as the judges. If the judges are in any way influenced in making the awards by the finish, or way an animal is fitted for the show, it is quite natural for the exhibitor to cater to this influence, and to strain every point in order to have his animals make a distinct impression upon the judge. While there may be no great objection to this so long as legitimate and fair methods are adopted, yet there is always the temptation to go a little too far along this line. Besides, there is a possibility of an injustice being done to the exhibitor of a superior animal, who may not have the taste or the means at his disposal to fit his animals as the others do. In other words, it may tend to shut out all but the professional exhibitor from the show ring, and to make it very difficult for the ordinary farmer, who becomes possessed of some high-class stock, to get a first place in the prize list.—*Farming*, Canada.

The Kid Glove Part of Dairying.

ED. HOARD'S DAIRYMAN:—A few weeks ago I advertised in your paper for a dairy farmer to take charge of my farm. I noted that I preferred a dairy school graduate and emphasized the fact that I wanted a competent man and a worker as I did the "kid-glove work" myself. Among other letters I received one unsigned from Mechanicsburg, Ohio. I judge it is from a male as I advertised for a man. Here it is, slightly expurgated:

"Dear sir:—I noted your ad. in HOARD'S DAIRYMAN. I would advise you to change the reading of it somewhat. It should read something as follows: Wanted: A full blooded Dutchman. The more ignorant the better. Naturalization not necessary. To work for a —— —— (pardon the expression) who wears canary gloves and smokes mild cigars. Please don't let such advertisements adorn the fair pages of HOARD'S DAIRYMAN. If there is anything on earth disgusting to a man it is to be tyrannized over by a kid gloved boss."

It's strange that a man who could pen such a gem as that, should be so modest as not to sign it. From the fact that he answered the ad. I should judge he was looking for a job. I'm sorry that his fear that I wear gloves or do not smoke strong cigars, has kept him from applying for the place, for I should like to see his own estimate of his qualifications for the place.

But to be serious, Mr. Editor, I relate this incident just to call attention to the difference between farm laborers and workingmen in the cities. I am connected with and share in the management of a factory that employs over 300 hands. These men do the work laid out for them by the owners or boss just as they are told to do it. They do not rebel because the owners direct the work in a manner different than they might do it. They sometimes suggest ways that are improvements and they are immediately adopted. I never heard of a strike in a factory because the boss wore kid gloves or smoked a certain brand of cigars or because the scheme of procedure or plans of laying out work was not in accordance with the ideas of the workmen. Wages, unions and hours of labor, etc., cause the strike.

But it is different on a farm. I became the owner of a small farm about seven years ago. Circumstances made it a dairy farm. I subscribed for farm papers, including HOARD'S DAIRYMAN, and studied them. I hired a farmer and put him on the farm. As I appeared at the farm in my office clothes (without kid gloves or cigars) he concluded that I knew nothing about dairy farming and so insisted on running the farm to suit himself. At the end of the year I settled up with my man and let him go. I was several hundred dollars out of pocket. My second man did not think much more of my agricultural talent than the first one, but we held a session one day in which it was agreed that as I paid all the bills I should be boss. Strange as it may seem we began to do better on the farm. He staid with me three years, and now owns a farm of his own which he is making a dairy farm as fast as his means will permit. He learned how to feed dairy cattle on my farm. Farmer No. 3 came to me from a good dairy farm and readily agreed to follow directions. Incidently I got a lot of valuable information out of him and he is well along in his third year's service with me. He now wishes to start into dairy farming for himself, which was the reason for my ad. for another man.

Almost all our transient help and men hired by the month have had a fine scorn of my "book notions" on dairy farming. But as they were not permanent fixtures I could stand it. I have a forty-acre farm and rent thirty acres and am now getting about $3,000 per year in milk, cream and pork off it. It takes two-thirds of that to pay the help, buy mill-feed and keep up repairs. The balance so far has gone into new buildings and better stock. It was more trouble to get Babcock test, separator, warm water in winter and cold water in summer, the weighing of milk of each cow, balanced rations, cooling of milk, etc., established than it would have been to have revolutionized the manufacturing process in a factory. The same amount of study and care in my manufacturing business would have brought me better returns but not more satisfaction. This is the reason I want it understood I do the "kid glove work." I don't want to go over this ground with a new man. Several of the men who have worked for me on the farm by the day or month and were not satisfactory because they would not look after small matters and details, have gone to work in the factory and do under my direction exactly as they are told. I know no explanation for it unless they think dairy farming is largely guess work and they can guess as well as any one, and they believe manufacturing is a business and is conducted under rules that the owners understand if they do not. Who can account for it?

Oshkosh, Wis. GEO. A. BUCKSTAFF.

A Pleasant Letter to Get.

The following kindly and appreciative letter is received from Mr. F. R. Underwood, LaMiranda, California. We take the liberty of printing the same, for the reason that it bears testimony to our oft repeated assertion that it will richly pay a farmer, who is a keeper of cows to make a study of what the DAIRYMAN has to offer:

ED. HOARD'S DAIRYMAN:—Enclosed you will find my subscription for one year, and in renewing I would say that I never invested a quarter of a dollar that paid me as big interest as when I made the trial of your five months subscription.

I read a great deal, and I never got hold of a paper that took me as long to read through as HOARD'S DAIRYMAN. It is solid from front to back. *It has helped me to more than double the yield of my cows.*

Mr. Wheaton's Canadian Dairy Notes.

Canadian Dairy and Live Stock Associations.

ED. HOARD'S DAIRYMAN:—During the past few weeks the executive committee and directors of a number of our agricultural associations met and arranged for future work, among them being the Board of Directors of the three dairy associations of this province.

WESTERN ONTARIO DAIRYMEN.

The directors of the Cheese and Butter Association of Western Ontario met on Sept. 6th, at the Toronto fair grounds. There were present: President Harold Eagle, James Connolly, R. M. Ballantyne, A. F. McLaren, M. P., John Prain, A. Wenger, Geo. E. Goodhand, J. A. James, J. V. Paget and Geo. Hately, Secretary, Brantford, Ont. The principal business transacted was arranging for the next annual convention, which it was decided should be held in the city of Stratford, on January 17th, 18th and 19th next.

In addition to the prominent Canadian speakers to be invited are three Americans, Hon. James Wilson, Secretary of Agriculture, Washington; John Gould, Ohio, and Prof. Farrington, of Wisconsin. If these three gentlemen accept the invitation American agriculture will be well represented at the forthcoming convention.

EASTERN ONTARIO DAIRYMEN.

A meeting of the directors of the Cheese and Butter Association of Eastern Ontario was held in Toronto on Sept. 5th. The following officers were present: D. Derbyshire, President, Brockville, Ont.; R. G. Murphy, Secretary, Elgin, Ont., and Directors P. R. Daly, T. B. Carlow, Jas. B. Whitton, L. L. Gallagher, John R. Dargavel, Edward Kidd, Wm. Eager, Henry Wade and John McTavish. It was decided to hold the next annual convention of this Association at Madoc, Ont., on January 10th, 11th and 12th next. The arrangements for speakers were left over for another meeting.

The Board expressed itself as being in favor of sending an exhibit of Canadian dairy products to the Paris Exposition and detailed arrangements regarding the exhibit were left with the president and secretary.

It was pointed out that the work of the Association was being crippled for the want of sufficient funds to carry it on successfully, and the board accordingly passed a strong resolution, appointing a committee to wait upon the Ontario Minister of Agriculture for the purpose of presenting the claims of the association for a larger grant.

CHEESE AND BUTTER MAKERS.

A new organization was formed in Western Ontario a couple of years ago, consisting only of makers. It is a live and growing organization and is actively engaged in promoting the best interests of the makers and of the dairy industry as well. The directors of this new Association met in London, on Sept. 13th, to arrange for their second annual gathering. There were present: L. B. Millar, President, London; John Brodie, Secretary, Mapleton, and Directors Geo. H. Barr, Geo. Goodhand, James Morrison, T. E. Nimmo and W. W. Brown.

It was decided to hold the next convention in Ingersol, on January 31st and February 1st, next. The program will consist chiefly of addresses and papers by makers, and the discussions will be made as practical as possible. A feature of this gathering will be an exhibit of dairy products, where $150 in cash will be given in prizes for cheese and butter shown.

ONTARIO EXPERIMENTAL UNION.

As the readers of the DAIRYMAN are perhaps aware, this is an organization consisting of ex-students of the Ontario Agricultural College and enterprising farmers and dairymen, who have banded themselves together for the purpose of carrying on experimental work along various lines of farm practice. The dairy experiments form an important part of this work and the results arrived at form a valuable addition to our stock of dairy knowledge.

The Board of Control of this Union met at Toronto, on Sept. 7th, and decided to hold its next annual convention at the Ontario Agricultural College, Guelph, on Dec. 6th, 7th and 8th, next. This will be an interesting gathering, as it will be the 25th anniversary of the Ontario Agricultural College.

POULTRYMEN.

A rather important meeting of poultrymen was held at Toronto on Sept. 8th. The meeting was made up of representatives of the various poultry associations in this province—and their name is legion—and was convened for the purpose of forming some central organization that might be more effective in promoting the poultry industry of this country. One of the chief objects of this new organization will be to form a circuit of poultry shows, so as to prevent any clashing of dates, as has been the rule heretofore.

AMERICAN SHROPSHIRE ASSOCIATION.

And there was another meeting held at Toronto on Sept. 4, that may be of interest to the readers of the DAIRYMAN though not distinctly connected with dairying. This was the meeting of the American Shropshire Registry Association which convened for the first time in Canada. This organization is presided over by the Hon. John Dryden, Minister of Agriculture for Ontario and its secretary is Mr. Mortimer Levering, Lafayette, Ind. That it is in a flourishing condition is shown by the fact that it has a membership of nearly two thousand and the list is increasing at the rate of one hundred to two hundred annually.

LIVE STOCK ASSOCIATION.

Mr. F. W. Hodson, who for a number of years has been the very efficient secretary of the Dominion Cattle, Sheep and Swine Breeders Association, has tendered his resignation to take effect at the end of the year when he assumes the position of Live Stock Commissioner for Canada under the Dominion Government. His new duties will mainly consist in promoting the live stock interests in the various provinces of the Dominion and in further developing inter-provinical trade.

Under Mr. Hodson's secretaryship the association referred to has made rapid progress and to-day is the most active organization of its kind in Canada if not on this continent. A most important work that has been carried on by it during the past two years, chiefly through Mr. Hodson is the shipment of pure bred live stock from Ontario to Manitoba and the other provinces. By this organized effort, breeders have been able to secure less the one-half freight rates from the railways, on their cattle sent through the association's car to the west. Another important work has been the publishing of a monthly list of stock for sale by the members

Wells Richardson & Co.'s Improved Butter Color

THE BEST IS ALWAYS CHEAPEST

FOR SALE.

Wishing to retire from business, will sell one hundred (100) cows, farm and fixtures, at a bargain. Buildings nearly new, with running water, and the highest price market for all milk raised.

Address A. B. FARMER, Lyons, Somerset Co., N. J.

of the association and sending it to prospective buyers in the other provinces and in the United States.

At a meeting of the directors of this association held on Sept. 6, Mr. A. P. Westervelt, who has been Mr. Hodson's assistant for several years, was appointed to succeed him. With this new officer the association will be able to carry on the same work as they are now doing in the same effective way.

SUPERINTENDENT OF INSTITUTES.

Mr. Hodson also occupied the position of Superintendent of Farmers' Institutes for Ontario which position he has also resigned. A successor has been appointed in the person of Mr. Geo. C. Creelman S. B. A. who will assume his new duties about Dec, 1st. Mr. Creelman is a graduate of the Ontario Agricultural College. After receiving his degree he was appointed on the staff of the Mississippi Agricultural College where he remained as professor of biology for nine years. He served as lecturer on the institute staff of that state during this time and was director of Institutes during 1896 and 1897.

Toronto, Canada. J. W. WHEATON.

Appetizing Rations.

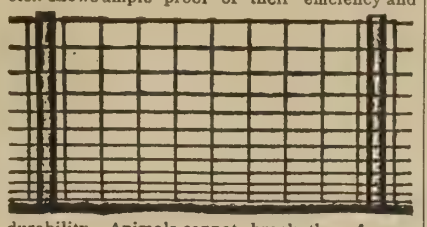
Whatever makes the feed taste better or makes it more enjoyable to the cow, increases its value for milk production. Early cut hay is best for the dairy cow, not only because it contains more protein than that cut late, but because its aroma and flavor make it more palatable to the cow. The appetizing effect from the early cutting and careful curing of all forage crops, increases their feed value for milk production. Freshly harvested and freshly ground grain is the most palatable to the dairy cow and will give best results. Dairymen who grind feed, should grind often, as grain that has lost its freshness is not the best relished by the cow.

Often the dairyman has a large quantity of coarse, rather unpalatable rough fodders, such as corn fodder and over-ripe or slightly damaged hay, which he must feed, and has only a limited quantity of choice roughness to feed with it. In this case, best results can be secured by giving the more palatable roughness in the morning or with the grain night and morning and feeding the poorer roughage as the last feed at night, to be eaten at the cow's pleasure during the night, or else put in racks in the yard for midday meals. Palatable feed in the morning gives a contended cow through the day, and this contentement brings more milk.

When several kinds of feed are given it is usual to throw them together into the manager and let the cow eat at will. This method does not secure the highest milk yield. You do not want your soup and pie served together on the same plate, and neither does the cow like this method of serving her food. If all the feed stuffs for a meal are thrown together, the more palatable are eaten first. In separating and eating these, the others are "mussed" over, and when the cow comes to eat them, they do not taste good and she will not eat enough to produce the greatest milk yield. We like to feed our most palatable roughness and give this just before the milkers go to their meal. When the milkers come back from eating, the cows have finished their first feed, and the less palatable roughness can then be given them. It will not then have been slobbered on, and will be better relished and more of it eaten. This method of feeding requires time and care, but it pays.

If the cows are given their rough feed in racks out of doors, it will pay to put feed in these racks often, so that the feed will be clean and appetizing. Mangers, feed-troughs and racks should be kept clean and fresh from old, soiled feed, both as a matter of health and because the food in a clean manger smells and tastes better.

The dairyman's rule should be to harvest feed in its most palatable form and feed in the most appetizing manner.—*Bulletin 81, Kansas Experiment Station.*



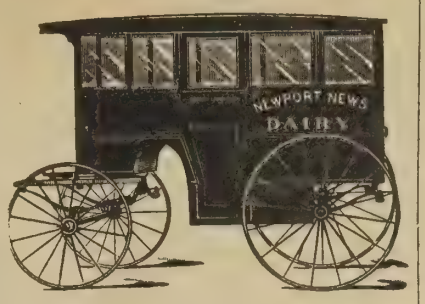
A Sound Statement.

American butter sells for less in the Cuban market, than butter from France, Holland and Denmark. And yet American butter is generally better than that coming from the other countries. The trouble is, that oleomargarine and other imitations are sold in Cuba as American butter. It is precisely the same dishonest methods which have so greatly injured the American butter trade in Europe. When our government stops this fraudulent trade, American butter and cheese will sell again in the markets of the world at prices as high as similar articles from other countries. This dishonest practice, on the part of exporters, not only disgraces the United States, but it takes millions of dollars annually, out of the farmers' pockets, by depreciating the value of their products.—*Philadelphia Press.*

ILLUSTRATION.

The sales of American Field and Hog Fencing thus far in 1899 might be considered marvelous were it not for the intrinsic merits of the fence which are becoming more thoroughly demonstrated every season.

"The fence that fences" is what the manufacturers call them, and investigation of the records made by these fences where they have been properly put up on farms, pastures, fields, orchards, etc., shows ample proof of their efficiency and

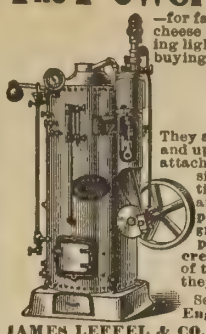


durability. Animals cannot break these fences. Action of cold and heat has no effect upon them and they successfully resist efforts of all kinds to destroy them.

Every rod of the American fence is guaranteed by the manufacturers, the guaranty being based upon intimate and absolute knowledge of just what enters into its construction. The wires are specially made for this purpose of best spring steel and are very heavily galvanized. There is thus a wide difference between the quality of American fences and fences made of ordinary wire, while at the same time the American fences cost no more than cheaper imitations or attempted substitutes.

The American fences are sold by agents in nearly all towns throughout the United States and Canada, but should no agency have yet been placed in your town, the reader of this who desires further information can secure it by addressing the manufacturers, American Steel and Wire Co., Chicago or New York.

The World Cannot Show Its Equal



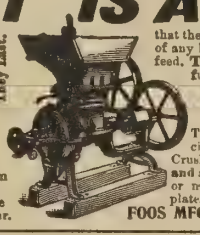
In STYLE, CONVENIENCE and DURABILITY.

Body hangs but 17 inches from ground, and turns can be made in its own length. Sold direct to Dairyman at bed rock prices. For description and price address,

THE NATIONAL WAGON CO.,
Chillicothe, Ohio

The Power Question

—for farm use, dairies, creameries, cheese factories—anything requiring light power, is best settled by buying one of these



LEFFEL ENGINES.

They are made in both horizontal and upright pattern, with engine attached to boilers. Being very simple and direct in construction they are economic of fuel and **great developers of power.** Best for **cutting and grinding feed, sawing wood, pumping water, separating cream, churning, &c.** Made of the best material throughout they are durable and long lived.

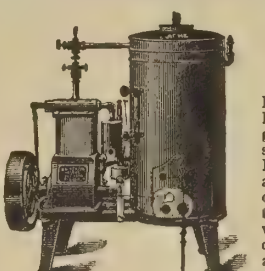
Send stamp for our **Book on Engines and Power.**

JAMES LEFFEL & CO., Box 50, Springfield, O.

IT IS A FACT

that the best results in feeding stock of any kind are attained with ground feed. **To grind feed** most successfully requires

SCIENTIFIC Grinding Mills.



They have largest possible capacity with minimum power. Crush and grind **corn, husk cob and all,** and all small grain singly or mixed. Have self-sharpening plates. **Free**—Catalog 1.

For Steam and Horse Power.

FOOS MFG. CO., Springfield, Ohio

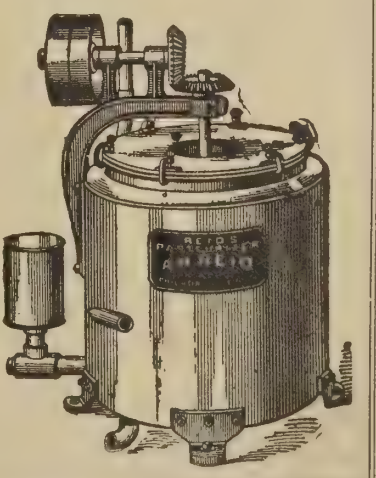
The REID LONG SPINDLE Separator

STANDS EVERY TEST.

The Reid Long Spindle Separator has been subjected to every possible test, under all conditions, and the results have proven that, for rapid and close skimming, for ease of regulation and economy of operation, it is as nearly scientifically and mechanically perfect as a separator can be.

Read This Statement

from an experienced and well-known New York Creameryman:



RED HOOK, New York, July 29th, 1899.

I have just completed a test of the machinery in the Medusa Creamery, under the supervision of a person competent to do this work with the following results, which I must frankly say, are entirely satisfactory:

When skimming 2,715 lbs. of milk per hour at a temperature of 85 degrees, making 32½ per cent cream, the skim milk showed a loss of .02 of 1 per cent.

When skimming 2,805 lbs. of milk per hour at a temperature of 156 degrees, making 32½ per cent cream, the skim milk showed a loss of .01 of 1 per cent.

We feel confident that the Reid Separator will skim 3,000 lbs. or more per hour and do equally as good work. D. W. WILBUR, (Medusa Creamery Co.)

Write for the Reid Long Spindle Separator book and descriptive circular of the **REID PASTEURIZER.**

Facts from a Skillful Dairy Farmer.

Uncle John Patterson, the noted dairy farmer of Kirksville, Mo., and ex-president of the Dairy Association of that state, has been made the subject of an extended write-up with illustrations by Ed. J. Chubbuck, in the St. Louis *Globe Democrat*.

Mr. Patterson was a Swede who came to this country but a few years ago with only $100, and unable to speak English. Now he has 700 acres of land, and milks ninety cows. There are some very excellent points in this write-up, for they are instructive in showing how the man himself has worked out the problem of successful dairying:

Mr. Patterson's fine dairy farm is located seven miles east of of the city of Kirksville. At the present time Mr. Patterson is milking ninety cows, making from 350 to 400 pounds of butter a week. This is put up in one-pound prints and sold to one dealer in Kirksville. The local dealer sells every pound of this butter in Kirksville. Aside from the butter, he sells on an average about $5 worth of buttermilk a week, thus making his weekly income from the dairy about $75, or $300 a month. It might be well to add here that Mr. Patterson's cash receipts for the present year will be about as follows:

For butter	$3,500
For buttermilk	300
For cows and young stock	1,000
For hogs	500
Total	$5,300

His expenses for the year will be about as follows:

For help	$1,200
For feed	400
For current expenses	400
Total	$2,000

According to the above figures, his clear profits for the year will be $3,300. This excellent showing is not because he has 700 acres of land, for Mr. Patterson told me that he could make the same amount of money and make it easier, if he had less land. He is now wanting to sell part of his farm.

"Uncle" John, as he is called throughout the state, attends to the feeding of the calves. Into the milk for each calf he stirs a little warm corn meal mush. When asked if he considered the corn meal mush a good feed, he replied that he could not see but what his calves did as well when fed corn meal as when fed oil meal.

In the afternoon "Uncle" John goes after his cows about four o'clock. The men leave the field at 4:30, supper is ready at five and by 5:30 o'clock milking again begins, and by 7:15 all the work about the dairy and stable is done, and every man has the evening to himself.

Mr. Patterson's success as a dairyman is due in great measure to the fact that he thoroughly studies the feed question. "The longer I work with my cows," said he, "the more I study how to secure good feed that is cheap enough. Dry corn, wheat bran and good hay cost too much, and don't produce a large enough flow of milk." Last fall he erected a large stave silo, thirty feet deep and twenty-four feet in diameter, with a capacity of 275 tons. This silo was erected at a cost of $350, but it proved to be such a "money saver" and "milk producer" that he will build another one nearly as large this fall. He is giving the cow pea a thorough trial this year, having some forty-eight acres in peas and ten acres in soy beans. Last fall when he filled his silo, he put in a few loads of corn and then a few loads of peas. The corn and peas were run through a cutter and elevated by means of a carrier to the top of the silo and dropped down and then thoroughly packed in. He fed about one bushel of this feed a day to each cow. He makes the claim that this made the cheapest and best cow feed he ever handled, the cows making better returns during the past winter than ever before.

COST HIM SEVENTY-FIVE DOLLARS.

A Minnesota Merchant Punished for Adulterating Butter.

Another process of making butter half as heavy again has turned up in Wabasha Co., where Inspector McConville, of the State Dairy Department had a county merchant before a justice of the peace, and persuaded him it was best to plead guilty of violating the pure food laws, and stand a fine of seventy-five dollars.

A sample of the preparation has been brought here for analysis, a white powder, consisting mostly of borax apparently. The active ingredient is supposed to be rennet, which makes a cheesy emulsion of the butter fat, and lets it soak up the water, which untreated butter would scorn to do.

The circular explaining to the guileless merchant the method of doubling his profits, begins with the self-evident (?) proposition: "Science has demonstrated the fact that butter is composed of microbes." The rest is equally precise and scientific.—*Winona* (Minn.) *Herald*.

Experiment Station Tests of Holstein-Friesian Cows.

[From June 1 to July 1, 1899.]

Official tests of Holstein-Friesian cows are invariably made by agricultural colleges and experiment stations or by authorities vouched for by them. The age is at the date of calving; the test is forseven consecutive days, commencing at the close of the days from calving; the fat is determined by the Babcock test, and the butter estimated on the basis of 80 per cent of fat to a pound, the rule by which estimates were made at the World's Fair.

Princes of Wayne 7th 28690; age 7 years, 4 months, 17 days; 11 days after calving; milk, 462.6 lbs.; fat, 18.49 lbs.; butter, 23 lbs., 11.8 oz.

Princess of Wayne 7th 29690; age 7 years, 4 months, 17 days; 18 days after calving; milk, 489.5 lbs; fat, 19.06 lbs.; butter, 23 lbs., 13.3 oz.

Princess of Wayne 7th 28690 (net profit test); age 7 years, 4 months, 17 days; milk, 487.9 lbs.; fat, 19.285 lbs.; butter, 24 lbs., 1.7 oz.; net profit, $4.12.

Tirania 3d's Netherland 39008; age 5 years, 7 months, 15 days; 30 days from calving; milk, 397.6 lbs; fat, 15.361 lbs.; butter. 19 lbs., 3.2 oz.

America 2d's Pauline DeKol 37096 (net profit test); age 4 years, 6 months, 28 days; 36 days after calving; milk 500.2 lbs.; fat, 15.343 lbs.; butter, 19 lbs., 2.8 oz.; net profit, $3.16.

Catrina 7th's Pietertje 28203; age 8 years, 2 months, 25 days; 42 days from calving; milk. 448.3 lbs.; fat, 14.449 lbs.; butter, 18 lbs., 1 oz.

Pietertje Hengerveld Lady DeKol 37060; age 5 years, 2 months, 2 days; 26 days after calving; milk, 406.3 lbs.; fat, 13.523 lbs.; butter, 16 lbs., 14.5 oz.

Amarilla's Koningen 11948; age 10 years, 12 days; 123 days after calving; milk, 428 lbs.; fat, 13.16 lbs.; butter, 16 lbs., 7.3 oz.

Korndyke Queen DeKol 41934; age 3 years, 7 months, 20 days; 9 days after calving; milk, 341.8 lbs.; fat, 12,695 lbs.; butter, 15 lbs., 13.9 oz.

Judith W. 5th 22947; age 8 years, 10 months, 27 days; 103 days after calving; milk, 407.4 lbs.; fat, 12.296 lbs.; butter, 15 lbs., 6 oz.

Jannek Netherland Clothilde 31542; age 7 years, 11 days; 56 days after calving; milk, 353.7 lbs.; fat, 12.182 lbs.; butter, 15 lbs., 3.6 oz.

Edith Grace 39445; age 3 years, 10 months, 18 days; 36 days after calving; milk, 429.8 lbs.; fat, 12.171 lbs.; butter, 15 lbs., 3.4 oz.

Snowball Clothilde 37527; age 5 years, 2 months, 15 days; 17 days after calving; milk, 396 lbs.; fat, 13.083 lbs.; butter, 16 lbs., 5.7 oz.

Winana Clothilde 44586; age 2 years, 11 months, 30 days after calving; milk, 387.6 lbs.; fat, 11.859 lbs.; butter, 14 lbs., 13.2 oz.

Rose Zoldusky Pauline 45755; age 3 years, 2 months, 25 days; 10 days after calving; milk, 338.3 lbs.; fat, 11.782 lbs.; butter, 14 lbs., 11.6 oz.

Edith Prescott DeKol 44886; age 2 years, 3 days; 28 days after calving; milk, 319.6 lbs.; fat, 9.448 lbs.; butter 11 lbs., 13 oz.

Amarilla Aaggie Wit 2d 47062; age 2 years, 2 months, 15 days; 8 days after calving; milk, 291.6 lbs.; fat, 8.079 lbs.; butter, 10 lbs, 1.3 oz.

Roxy Pietertje 40731; age 3 years, 5 months, 3 days; 145 days after calving; milk, 293.9 lbs.; fat, 9.436 lbs.; butter, 11 lbs., 12.7 oz.

May Vaughn 42533; age 1 year, 11 months, 10 days; 151 days after calving; milk, 297.4 lb.; fat, 8.745 lbs.; butter, 10 lb., 14.9 oz.

Clothilde Artis Raphaello 43584; age 2 years, 11 days; 59 days after calving; milk, 332 lbs.; fat, 9.754 lbs.; butter, 12 lbs., 3.1 oz.

Korndyke Pietertje DeKol 44873; age 2 yeais, 1 month, 5 days; 18 days after calving; milk, 283 lbs.; fat, 8.455 lbs.; butter, 10 lbs., 9.1 oz.

Fanny Pietertje DeKol 44874; age 2 years, 1 month, 11 days; 18 days after calving; milk, 286.3 lbs.; fat, 8.387 lbs.; butter, 10 lbs., 7.7 oz.

Inka Pietertje DeKol 45017; age 2 years, 22 days; 7 days after calving; milk 254.4 lbs.; fat, 7.784 lbs.; butter, 9 lbs., 11 oz.

Inka Pauline DeKol 45137; age 2 years, 8 days; 15 days after calving; milk, 239 9 lbs; fat, 7.979 lbs.; butter, 9 lbs., 15.6 oz.

Joy of Clothilde 43762; age 2 years, 10 days; 49 days after calving; milk, 321 lbs.; fat 8 399 lbs; butter, 10 lbs., 8 oz.

Duchess Ormsby 3rd Butter Girl; age 1 year, 9 months, 9 days; 16 days after calving; milk, 241.4 lbs.; fat, 7.333 lbs.; butter, 9 lbs., 2.7 oz.

Bell Rose Duchess 47244; age 1 year, 6 months, 8 days; 31 days after calving; milk, 220.1 lbs.; fat, 7.25 lbs.; butter, 9 lbs., 1 oz.

Debora's Inka 2nd 43831; age 1 year, 11 months, 17 days; 41 days after calving; milk, 298.1 lbs.; fat, 7.942 lbs.; butter, 9 lbs., 14.8 oz.

Manor DeKol Belle 46599; age 2 years, 15 days; 66 days after calving; milk, 259.1 lbs.; fat, 8.528 lbs.; butter, 10 lbs., 10 6 oz.

Virginne Pietertje 46887; age 2 years, 5 months, 10 days; 33 days after calving; milk, 279.9 lbs.; fat, 10.154 lbs.; butter, 12 lbs., 11.1 oz.

Heilo Aaggie Johanna 46517; age 2 years, 12 days; 14 days after calving; milk, 255.7 lbs.; fat, 7.589 lbs.; butter, 9 lbs., 7.8 oz.

Wase Parthenea Colanthus 44730; age 2 years, 21 days; 41 days after calving; milk, 252 2 lbs.; fat, 8.032 lbs.; butter, 10 lbs., 9 6 oz.

Elgin Belle 7th 46805; age 1 year, 9 months, 4 days; 10 days after calving; milk, 254.5 lbs.; fat, 7.615 lbs.; butter, 9 lbs., 8.3 oz.

Mutual Wayne DeKol 44492; age 2 years, 1 month, 1 day; 38 days after calving; milk, 257.5 lbs.; fat, 8.169 lbs.; butter, 10 lbs., 3.4 oz.

Carrie Cole 2nd 42313; age 2 years, 7 months, 7 days; 38 days after calving; milk, 326.1 lbs.; fat, 9,087 lbs.; butter, 11 lbs., 5.7 oz.

Midland DeKol Pauline Paul 42722; age 2 years, 6 months, 10 days; 30 days after calving; milk, 235.5 lbs.; fat, 8.448 lbs.; butter, 10 lbs., 9 oz.

Copia 5th's Clothilde Lass 43766; age 1 year, 9 months, 6 days; 30 days after calving; milk, 287.2 lbs.; fat, 8.067 lbs.; butter, 10 lbs., 1 oz.

Winana Beets DeKol 44887; age 2 years; 27 days after calving; milk, 351.7 lbs.; fat, 9.211 lbs.; butter, 11 lbs., 8.2 oz.

Pietertje Tweede 2nd 43823 (second record); age 1 year, 11 months, 17 days; 52 days after calving; milk, 286.1 lbs.; fat, 9.632 lbs.; butter, 12 lbs., .6 oz.

Raschida 43878; age 2 years, 2 months, 2 days; 43 days after calving; milk, 379 lbs.; fat, 10.417 lbs.; butter, 13 lbs., 3 oz.

ILLUSTRATION.

A NEW ENSILAGE AND FODDER CUTTER.

We are presenting herewith a cut of something entirely new in the line of feed and ensilage cutters. This is a cut of the "Blizzard", which is manufactured by Dick's Agricultural Works, Canton, Ohio.

The "Blizzard" differs from all other machines of its class in the following points: It is built exclusively for power, the cutting knives are attached directly to the fly wheel, which entirely obviates the ordinary cutter head; it is equipped with two sets of knives. one which firsts spilts the feed or fodder and then cuts it off; the knives

work on the gradually increasing or shear plate principle; the fly wheel is a solid disk; perfect and easy in all its adjustments. Cuts a variety of satisfactory lengths, and is unusually strong and well made. The most remarkable feature, however, is the pneumatic attachment or feed carrier. This is a pipe through which is passed a strong current of air sufficient to deliver green or dry feed to any height likely to be required; carries the feed straight up and delivers it at any angle by a system of elbows. Easily adjusted and easy to handle.

These machines are made in several convenient sizes to fit any requirement. Write the manufacturer for catalogue and further information.

There is but one good make of lamp-chimneys — Macbeth — and your dealer knows it.

A Tornado Overturns an Empty Silo.—Remedy Wanted.—Butter Fat and Butter.

ED. HOARD'S DAIRYMAN:—We built a stave silo this season, used 2×6×24 pine, and a Cornell Bulletin for a guide.

The day before we were to fill it a young tornado twisted its tail in our neighborhood, and our pride was blown over in an adjoining clover field.

However we rebuilt and filled it in less than a week, though the corn was a trifle dry.

We would like information as to best method of anchoring silos, as we don't want to rebuild ours again next summer.

We are young dairymen and this is our first experience with a silo. Of course we like HOARD'S DAIRYMAN next to our Jerseys.

In computing amount of butter from Babcock test, is butter or butter fat taken at 100%?

Would 20 cents for butter be equal to 23⅓ cents for butter fat? A. J. N.

Valley Mills, Ind.

As tornadoes are not annual visitors, and in fact seldom visit one place twice in a decade, it may reasonably be expected that our friend's silo will stay put without anchoring or guys. To make assurance in this case doubly sure, if any device can withstand a tornado, we can think of no better plan than to "guy" the silo with wires, much the same as telegraph and telephone companies stay their poles where a bend is made or a corner is turned. Or take out tornado insurance.

In estimating butter from the test it is wholly immaterial whether one figures by the rules of interest or discount, provided he observes the proper rules. When the fat is given we estimate the butter by adding one-sixth, but when the butter is given we estimate the fat by deducting one-seventh. In other words, six pounds of fat in the milk is considered equivalent to seven pounds of commercial butter, and therefore 23½ cents for butter fat is estimated as being the same as 20 cents for butter, where there is no account made of the cost of manufacturing the fat into butter.

Dairying in the Philippines.

An Australian has recently brought fifty cows from his own country to Manila and started a dairy. He has demand for more milk than he can supply at fifty cents (Mexican) a quart. The first reserve United States hospital pays him a milk bill of $2,000 gold a month.

These were the first cattle, except the water buffalo, ever brought to the Philippines, and the cost of the freight from Australia amounted to twice the value of the animals in the British colony.

The water buffalo, besides supplying the natives with milk, is slaughtered for the meat, but very little is used in the Philippines. They are also the beast of burden and family pet. The children will climb all over the animal, and it is as gentle as a kitten, except when it is very warm and the flies are troublesome, it will take a very sudden notion to run for the nearest river or mud pond, burying itself completely, and wallowing until covered with a coat of black, sticky mud, which serves to keep the flies from torturing it so effectively.

CONCERNING OUR ADVERTISERS.

The advertisement of A. C. Brosius, of Cochraneville, Pa., makes its first appearance in this issue of our paper, for the new season's business. Our readers will remember this gentleman as being the manufacturer of the now famous Dehorning Knife which has been of such great value to stockmen everywhere. This is the dehorner which took highest award at the World's Fair. It differs from all other devices of its class, in the fact that it cuts evenly from four sides at once. This prevents all bruising and crushing of the horn, and constitutes the most humane way of removing the horns. Then, too, it is such a quick and safe way for both man and animal. Write Mr. Brosius for circulars, prices, etc.

The O. S. Kelly Company, of Springfield, Ohio, make their first appearance in this issue for the season of 1899. Their ad. will be found on another page. Our readers will probably recall that the Kelly people are the manufacturers of the reliable Kelly Duplex Grinding Mills. This mill is well and favorably known, and its friends and users are distributed over the entire country. The word "duplex" in the name, applies to the grinding plates, or more properly burrs, which are double, making this mill one of unusual capacity for its size.

VETERINARY.

Queries in this department answered by WM. HORNE, M. D. V. S., Janesville, Wis.

COW PHYSIC—Three-fourths to 1¼ pounds Epsom Salts (according to age and size of animals) and two ounces of best ground ginger. Pour over this three pints of boiling water. When at 105° F., give gradually as one dose.

PROBABLY NYMPHOMANIA.

Have a Jersey cow that will be seven years old in January, 1900. Has dropped five calves, last one, March 19, 1899. Was in heat and bred, April 24, 1899. Was not in heat again until July 6. Was bred. Was in heat again Sept. 17 and 27; was not bred either time. The morning of Sept. 22, noticed a discharge, about a pint, the color and consistency of the white of an egg with about a spoonful of something yellow in it. Again, the evening of Sept. 26, same kind and amount of discharge, with a small bit of something white. She has a good appetite, is in good condition, and is giving twenty-five to twenty-seven pounds of milk per day. Is with the herd except when in heat. What is the trouble and a remedy for same.

Bellmore, Ind. W. B. T.

ANSWER.

I think your cow aborted. Isolate this cow and watch her closely, and keep correct account of her symptoms. You have told me the trouble—as to cause, I am at sea. I think she is a nymphomanic, and will need to be treated for that. Be particular as to any kind of discharge, and if there be any, note the kind, and apply again.

SPRAINED ANKLE.

I have a mare that sprained her right, forward ankle last February. It swelled up and she was very lame, but after using a liniment was so I used her through April and May. In June I blistered and gave her rest so that she was lame only after a drive of a few miles. I worked her at haying and on a horse power to churn and separate through July which made her more lame. Since then I have blistered twice and turned her out to pasture, but she has grown worse until now the ankle is twice natural size, hard and the inflammation extends up to the knee.

West Enosburg, Vt. F. F. D.

ANSWER.

Picture yourself working hard with a sprained ankle. Then ask, would you blister your sprained ankle. I think not. Horse power—this was cruel and ruinous. You have fixed for a permanent enlarged leg, I fear. You came to the DAIRYMAN too late, much too late. Make strong oak bark tea decoction, to each quart add half a pint of acetic acid. Rub in some of this daily. After rubbing, soak a sixteen foot strong cotton bandage and wind evenly round the leg. Let it overlap just half and moderately tight. Remove daily.

MAMMITIS.

Heifer twenty-three months, fresh on 14th inst.; took calf to bucket 17th. Fearing spoilt udder on 19th I put five weeks' old calf with her to drain udder once; no apparent trouble till 23rd when near three pints from one quarter was taken appearing like curdled milk and blood, occasionally some stringy for only two milkings. Referred to back numbers in DAIRYMAN and gave on 24th inst. ¾ lb. Epsom salts and daily 1 teaspoonful spirits nitre; kneading with ¼ turpentine, ¾ camphor. That quarter milks free, but in center remains swollen, other quarters clean.

Second case. Cow six years, fresh August 17th. At various times during the day there drops out of udder what looks like white of egg, varies in quantity. P. H., JR.

Donerail, Ky.

ANSWER.

1. When I say nitre I always mean saltpetre. This is twenty times as strong as nitre dulc, viz., sweet spirits of nitre. A teaspoonful is a dose for a baby only; three-quarters of a pound of Epsom salts will not act in such cases; a full pound to one and one-quarter is needed. Give sixty grains of iodide of potassa in a little cold water as a small drench daily for ten to thirty days. Paint over the swelling with strong tincture of iodine daily for awhile.

2. This albuminous milk is the result of injury, I think—perhaps, and likely, hard milking. Change the form of milking; inject Tilden's bromo chloralum one to eight of cold water, inject with a rubber syringe. Do this quite easily. After one syringe full is injected wait a few minutes and then gently squeeze it out, and then inject another half ounce by half ounce syringe; in five minutes again draw this out. Then inject another half ounce and let it remain in; do this until not needed. A full dose of physic will be good; never does harm excepting to emaciated subjects.

NAVICULAR DISEASE.

Have mare lame in front foot, said to be navicular. Would like Dr. Horne to tell me, through the DAIRYMAN, what is best to do. G. K. W.

Toronto, Ont.

ANSWER.

If navicular disease, sell the horse, as there is no cure for confirmed disease of the long pulling and flexor tendons of the horse's foot. I believe I have had as many such patients as any living man. I also believe I have tried all and every conceivable thing for the amelioration of navicular lameness, and *never* a satisfactory result; nerving does stop the lameness for a little while, so as to cheat some poor unfortunate trader or buyer.

BLOODY MILK.

Have a two-year-old heifer that came in last fall. For the past two months she has given bloody milk from one fore quarter. Have given her saltpetre and salts. Is no better. What should I do for it? E. D.

Tunnel City, Wis.

ANSWER.

Repeat full dose of physic, then add acetate of lead (sugar of lead). If full size, give a sparing scruple, one dose each day, for three doses; then wait three days; then give one dose for two days; then again wait five days; then one dose only. Restrict the food for a little while. Rub with compound tincture of iodine, one part; water, three parts. Use an easy milk tube for a while, so as to give rest to structural parts of the udder.

NOT UTERINE CATARRH.

We are especially interested in the veterinary department, and at present have a three-months-old calf that we have not found anything like it described. Just bought it but find it passes something like matter from the urinary organs. If it was older might say it was catarrh of the womb, but don't know what it can be, being so young. Otherwise it is O. K. The odor is offensive, resembling the most aggravated nasal catarrh. M. Bros.

Pheonix, Arizona.

ANSWER.

I entertain no idea of such a thing as uterine catarrh. I am quite satisfied there is some form of ulceration, likely an abcess. This I think is in the neck of the womb, and can be reached by a small hand and arm only, excepting proper instruments in professional hands. I am sorry I can't be definite and of better service to you. But to do this I would need a personal examination.

RETAINED PLACENTA.

I have a cow that gave birth to twin calves September 13th. She was in very good condition, and appeared all right until about twenty-four hours after calving. The afterbirth did not come away. She will not eat scarcely a thing, and is getting very thin. She has had Epsom salts two or three times.

Livermore Falls. A SUBSCRIBER.

ANSWER.

You will need to have someone take away the placenta, what is left of it. This should always be done after a few hours are passed without the afterbirth coming away. Let the cow lie in a slanting position behind. Cut your finger nails close, and insert the hand after it is larded, and bring away all the matter within reach. Hollow your hand so as to hold as much as possible of the putrescent mass. Give her golden seal, one-half ounce; nux vomica, one dram; old whiskey, two ounces; water, three ounces. One dose a day for two days, then one each second day for four days.

Horse Owners! Use GOMBAULT'S Caustic Balsam

A Safe Speedy and Positive Cure

Maine Feeding Stuffs Law.

The Maine legislature of 1897 enacted a law to regulate the sale and analysis of concentrated commercial feeding stuffs. This was the first law of the kind to be enacted in America, and both because of its novelty, and because the trade has been without local restriction, the bill excited considerable opposition on the part of handlers of grain. The petitions from individual farmers, granges, farmer's clubs, and other agricultural organizations were so numerous that the act became a law without a very large dissenting voice in the legislature.

While the effects of this law were for the most part beneficial to the Maine feeder, neighboring states immediately began to feel the effects in that the inferior goods, which had formerly been evenly distributed were sent to the states other than Maine. While in the winter of 1898 Maine was practically free from low grade cotton seed meals, Massachusetts and particularly Rhode Island were inundated.

Studying the effects of this law in Maine, the Vermont legislature of 1898 enacted a law similar in all respects to the Maine feeding stuffs control, which law went into effect, July, 1899.

The Rhode Island legislature of 1899 adopted similar legislation and a law similar in all essentials to the Maine feeding stuffs law goes into effect in the state of New York, December 1st, 1899.

Thus we find this Maine law, the passage of which was urged so earnestly by the investigators at our Experiment Station, being adopted in all its essential features by our neighboring states. This they were obliged to do in order to save themselves from being the dumping grounds for cotton seed meal that contained an exccss of finely ground hulls and yellow clay; ground mixed feed that held more oat hulls than were necessary to protect the growing kernel; and middlings that were adulterated with mill sweepings and other substances.

The law, as yet, gives the consumer only partial protection. It should be extended so as to include both spring and winter brans. We do not believe that the western farmers are doing such slovenly work that they raise oats with the wheat they intend to market, to the extent that the hulls show plainly in the bran we find in our markets.

The law not only furnishes the cattle feeder protection, but it enables him to select such foods as are rich in the nutrients he wishes to use.

As a rule, our feeders have plenty of home grown fodders that are rich in carbohydrates and fats, but poor in protein, and as a matter of course, they need to purchase protein.

The tags on the feeds in the markets show their composition, and by applying the price the feeder is enabled to decide whether the protein is cheaper in the cotton seed meal, linseed meal, gluten meal or feed flour, and purchase accordingly.

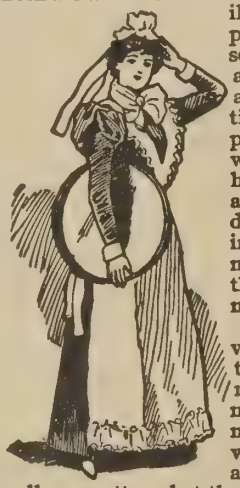
This one feature of the law alone, if it gave no protection whatever, would be worth to the farmer far more than it all costs him, for a knowledge of the composition of the foods he buys, at the time he buys, enables him to buy and feed understandingly without being subjected to the trouble and expense of analyzing every lot of feed he purchases.

This law is being well received by our people and it will be but a short time before they will be as familiar with the tags, and study and apply them to their feeding operations, as they now are with the analyses on the tags on every bag of fertilizer they use.

Just as a knowledge of the composition of commercial fertilizers makes possible their economical purchase and use, so the data furnished by the feed tags, will help to educate the farmer along the lines of economical cattle feeding, as nothing has ever done before; and so we say, extend the law until it shall include every concentrated cattle food in the market and furnish the farmer every possible means for a thorough knowledge of his work.—*Turf, Farm and Home.*

Sifted Wood Ashes for Hogs,

In the *Stockman and Farmer* of June 8th, J. W. P. writes that his sow eats her pigs: We often read of similar cases, and every time some one has a cure. It is generally believed that constipation is the cause; if so, a preventive is better, also cheaper, than a cure. Sows properly kept, fed on mixed feeds, with plenty of exercise, are not liable to be constipated. We have practiced feeding sifted wood ashes in slop, once a day for a week or so before and after farrowing. Feed a large cook spoonful to each matured hog. We also feed a spoonful to each bucketful of slop to growing hogs. It tends to sweeten the stomach and is a very cooling physic. It rids the stomach and intestines of all worms. We think plenty of salt and ashes good for all stock. Horses having free access to it are not liable to colic, and we will almost guarantee a cow against milk fever if we can get her physicked lightly before and after calving with sifted wood ashes. We feed a single handful in a bran mash or in a mixed ground feed dampened. We think it a safer remedy in the average farmer's hands than to use drugs. We also sift them in a meal sieve to make sure of taking out all glass or pins that may happen in, then throw the charcoal out for the hogs to eat.



How Milk For City Use is Handled in Denmark.

The Milk Supply Association, of Copenhagen, Denmark, requires each farmer supplying milk to bind himself to inquire and truthfully report every case of infectious disease occurring on his premises or among persons in his employ, the association in return contracting to pay the highest price for such milk, although it is rejected. Every cow on farms supplying milk to the association is carefully examined fortnightly by skilled veterinary surgeons, as are also the stables, food, etc. Inspectors and experienced dairy maids also visit the farms to observe their management, cleanliness and methods of cooling the milk, regarding all of which there are strict regulations. The milk must immediately after milking be cooled to 41 degrees, and must never be allowed to stand in the sun. Food which will flavor the milk disagreeably—such as turnips—must not be used, but carrots and mangels may be fed in small quantities, mixed with large quantities of corn. Stall feeding is not allowed in summer, when cows must be fed in the open air on grass and clover.

On the arrival of the milk in Copenhagen it is at once sampled by experts, its temperature noted, placed in cans surrounded by ice, and the next morning run out into filtration tanks, which have three layers of gravel separated by perforated trays, the upper layer being covered with six thicknesses of fine cloth, the whole being kept in position by a pyramidal framework, which presses down the tin trays. As the milk rises to the tops of the tanks it passes into a large storage receptacle, and thence to the bottling room, where it is bottled or canned, labelled, tied up with a thread, sealed with a leaden stamp seal, and then taken to the carts for distribution, the carts being so constructed as to prevent tampering with the cans, and the milkman being in uniform. The cans are scalded, steamed, and sterilized daily, and the filter boiled in hot water and steamed daily.

WORKING WOMEN.

Women are women after all. Mistress and maid are alike in physical make-up. Both are women. Both are subject to the ills and ailments peculiar to their sex. But the servant seldom gets any consideration. She is expected to do her work even if her head does throb and a dreary, dragging, bearing-down feeling makes her wish that each step might be her last.

Dr. Pierce's Favorite Prescription is made for maid as well as mistress. It makes weak women strong and sick women well, no matter what their station in life. It gives the poor working woman an equal chance with her richer sister and at exactly the same price.

The servant who uses "Favorite Prescription" at a moderate price per bottle is much more likely to get well than her mistress who calls in an expensive, local physician. If she will write plainly to Dr. R. V. Pierce, at Buffalo, N. Y., her case will have the attention of a physician who has cured more women than any one hundred other doctors and who has a record of over thirty years' successful practice. Her letter will be considered strictly confidential, will be promptly answered in a plain envelope, so that prying eyes of others may not get even a hint, and she will have the benefit of the very best medical skill without a cent of charge for it. Thousands of women have written and been cured. And by this method they have avoided the "examinations" and "local treatment" so invariably insisted upon by local practitioners and so abhorrent to every modest woman.

YANKEE SILO SENSE —our latest Silo booklet, ex-Gov Hoard's Latest Views—mailed free to any one naming this paper

SMALLEY MFG. COMPANY, Sole Makers, MANITOWOC, WIS.

SAVE THE WHOLE CORN CROP

If you allow your corn to stand until killed by the frost, bleached and faded by rain and snow, and then husk out the grain by the ordinary method, you are losing fully 50 per cent of the value of the crop. No business on earth could long stand such a drain, and there is no reason why you should endure it. Don't do it. Save the whole crop.

Feeding corn hay admits of selling all your meadow hay. Corn hay is easily baled and can be sold in the cities—another source of profit. Buy a "Janney" and use it on your own crop, then make the price of it by husking and shredding for your neighbors. Write us and we will tell you how others have done and are doing it.

THE JANNEY COMMON SENSE CORN HUSKER AND FODDER SHREDDER

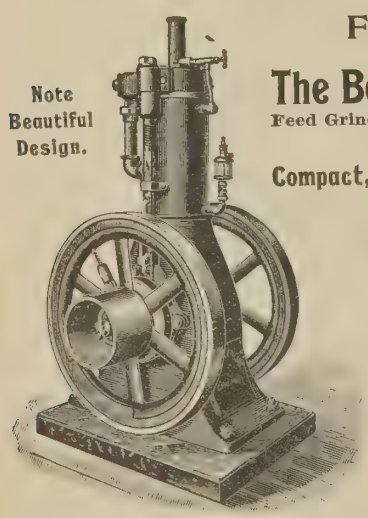
will do this cheaply and effectively. First cut the corn and shock it. When well cured haul to the **"Janney"** and run it through. It husks all the corn and shreds the fodder into "corn hay." Makes clean feed; takes out all smut, dust, dirt, chinch bugs, etc.

JANNEY MFG. CO., BOX 29, OTTUMWA, IOWA.

MAKE ONLY SWEET ENSILAGE

Ever since the ensilage system has been introduced in this country it has been the ambition and effort of siloists to ***produce sweet ensilage.*** The making of sweet ensilage depends principally upon two things—***1st.*** the use of a well matured crop and ***2nd,*** upon low fermentation. Granting the maturity of the crop, shredded ensilage makes the sweetest ensilage. The reasons are, that shredded material is of a nature that makes it pack much more closely in the silo. That means exclusion of air; there can be no extreme fermentation and consequent development of acid without the free action of the air. ***Shredded ensilage possesses other advantages in addition to its sweetness:—*** it is eaten with great avidity by animals, being a long, soft substance and free from any sharp angles and corners to cut or lacerate the mouth and gums; it is therefore fed with less waste,

The best way to Shred Ensilage is with the St. Albans Ensilage and Fodder Shredder.



It is the Original Shredding Machine and all other so-called shredders are merely imitations of this one. ***It will certainly pay you*** to look into the merits of this proposition and machine before buying. We mail free a pamphlet on the subject.

ST. ALBANS FOUNDRY CO., ST. ALBANS, VT

The Burrell Upright Engine

FOR GAS OR GASOLINE.

Note Beautiful Design.

The Best Power to run Pumps, Grain Separators, Churns, Fodder Cutters, Feed Grinders, Saws and Dynamos,

BECAUSE it is Simple, Compact, Safe, Steady Running and Economical.

It is closely governed and made with interchangeable parts. It is built of the finest materials, carefully and accurately finished, and thoroughly tested before shipping. They are made to stand the wear and tear of every-day service, and cannot be too highly recommended to anyone wanting a power of this capacity.

THE NEW BOOK Feeds and Feeding

By Prof. W. A. HENRY, Wisconsin Experiment Station.

This book should be in the hands of every stock feeder in the country. Every reader of HOARD'S DAIRYMAN ought to have it. It is a large, well bound book, nicely printed, over six hundred and fifty pages. Price $2.00

Four Yearly Subscribers at $1.00 Each ($4) Will Secure It as a Premium.

Four Yearly Subscribers at $1.00 Each ($4) Will Secure It as a Premium.

Of This Book Hon. JAMES WILSON, Secretary of Agriculture, Washington, writes as follows:

"Prof. W. A. Henry, Dean of the Agricultural Department of the University of Wisconsin, has recently given to the American student and the American farmer a work on feeds and feeding. Singularly enough, up to this time we have had nothing along this line sufficiently comprehensive from both the scientific and practical standpoints. We have had very able works from both, but Prof. Henry is the first to combine science with practice, and give us a work that will be of value alike to the instructor in the Agricultural College, to the student who is seeking the principles underlying feeding, and to the practical farmer who feeds.

This publication will take its place immediately in the college library, and ultimately in the private library of every farmer in the land. When the instructor, student or practical farmer inquires where there is a work thoroughly exhaustive of this subject, he can now be referred to Prof. Henry's book.

Sent as above, or will be forwarded, carriage paid, on receipt of price, $2.00.

HOUSE FOR CLEAN CLEANING
SAVOGRAN INDIA ALKALI WORKS,-BOSTON.
Medals—Bronze 1878, Silver, 1887, World's Fair, 1893.

Nos. 28, 30 and 32.

Please get the above numbers firmly fixed in your memory, as you will want to recall them some day. A few days ago two of our customers walked for miles before they could get anyone to tell them these numbers. They knew we had recently located in Chicago, but had forgotten our address, and upon making inquiry of our competitors were informed by three of them that there was no such firm in town. At the same time they were urged to buy what they wanted without spending more time in looking for us. Our customers knew that false statements were being made to them and decided to make inquiry through one of the Dairy papers. Upon calling at the office of the publisher they were at once informed as to our location. This sort of competition is contemptible to say the least, and will doubtless do our competitors more harm than good. They know where we are all too well; that we do not belong to the "Combination" and that creamerymen who call upon us will get something better than "Combination" prices. Of course they are not anxious for the creameryman to know this and naturally enough will give no information regarding our address when it can be avoided. It will therefore be well for you to bear in mind the following

Nos. 28, 30 and 32 Canal St., Chicago,

Just two blocks north of the Union Depot, on the east side of the street, and the second door from the corner of Washington and Canal Sts. Here you will find our offices, our sales room, and our repair shop. We invite you to call and let us quote you prices on our complete line of

CREAM SEPARATORS,

Vats, Churns, Butter Workers, Combined Churns and Butter Workers, Boilers, Tanks, Tread Powers, Feed Cookers, Belting, Pulleys, Piping, Pipe Tools, Etc., Etc.

The Sharples Company,
28, 30 and 32 So. Canal St., - CHICAGO, ILL.

The School of Experience.

When a man pays good hard earned money for his experience, there is no doubt in his mind as to the results. The results of dear bought experience are invariably carefully observed. This is no less true in the purchase and use of separators than elsewhere in business pursuits. If a creameryman really wants, however, to avoid the expense of buying separator experience, he may do so by first buying a

SHARPLES TUBULAR SEPARATOR.

If he once does this he has settled for all time, in the most satisfactory and money-saving way, the separator question. This at least is the experience of those who have tried it, in witness whereof we quote the following letter :—

Platteville Cheese and Produce Company,
MANUFACTURERS AND DEALERS IN
FINE CREAMERY BUTTER AND CHEESE.

PLATTEVILLE, WIS., Sept. 3, 1899.
P. M. SHARPLES, West Chester, Pa.

Dear Sir:—I take pleasure to inform you that the No. 25 Tubular Separator which I bought of you on April 15, '99, is doing fine work.

We are skimming from 2,500 to 3,000 lbs. of milk per hour, and it takes a very small amount of steam to run it and it skims down to two one-hundredths. It leaves the cream in a fine, smooth condition and without any foam on it. Our butter has improved fully 10% in flavor and quality since we ran it, and the Tubular will be the only separator we will use after this.

Respectfully yours, F. KROG.

REMEMBER . . .

That it is a hollow bowl.
That it spins on air.
That it requires no repairs.

That it makes only smooth, free from froth cream, that it is a clean skimmer of large capacity, and that it is *absolutely "burst proof"* and safe.

Send for Catalogue No. 46.

The receipt of the DAIRYMAN is sufficient notification that the money has been received. The label on the paper will show date to which subscription is paid. In case of renewals if date on label is not changed within two weeks after remittance is sent, inform us at once.

Remit by draft on Chicago or New York, or Post Office or Express Order; never by personal check.

ADVERTISING RATES.

Twenty-five cents per line, (agate measure) 14 lines per inch, each insertion.

Reading notices, 50 cents per line (nonpariel measure) each insertion.

IN view of the increased value of dairy products the Mohawk Condensed Milk Company, of St. Johnsville, N. Y., has divided a bonus of $3,000 among its patrons and promised them an advance over the contract price of milk.

ABOUT two million cases of condensed milk are manufactured in the United States yearly, more than half of which is consumed at home. The remainder of the output is exported. Japan, China, India and the Sandwich Islands are large consumers of American condensed milk, and the foreign demand is constantly growing.

MR. W. P. BISSELL, of Oneida, Iowa, sends us a photograph of his two-year-old Holstein heifer, from which the illustration on this page is made, and writes as follows:

She was two years old the 27th of last April, calved the 31st day of March, and made 10.13 pounds of butter from 259 3-16 pounds milk, *on grass alone.* Her name is Grace Pietertje Pauline DeKol, No. 42845, Holstein-Friesian Herd Book, sired by Paul Beets DeKol, dam, Aaggie Grace 2nd Pietertje,—Mr. Henry Stevens' great show cow, winning first and sweepstakes at all places shown last season; also second in butter test, at Omaha, with an official butter record of twenty-three pounds, eight ounces butter in seven days, and 100 pounds milk in twenty-four hours. The picture was made same day heifer calved, and is poorly executed, but you can get the outlines of the animal, and comments would be acceptable.

The picture is indeed a poor one and the "posing" probably does the heifer injustice, but it serves to confirm the reported seven days' test, because in so many particulars it shows the true and necessary dairy form.

Perhaps the most notable thing about this animal is the absence of all the "points" required for a typical beef animal. The top and bottom lines are neither straight nor parallel, the back bone is too prominent, the neck too thin, and the rump too pointed. These things do not necessarily indicate a first-class dairy animal, but they do promise that the surplus food eaten will not go primarily to the production of flesh. The primary condition for profitable dairy production is the ability to eat, store and digest a much greater amount of feed than is necessary for simple bodily maintenance, for all profit comes from this source. It will require not far from nine pounds of digestible nutrients, per day, to keep up the animal structure of this heifer. Every pound in excess of this, which is digested and assimilated, will go either to supplying the waste occasioned by exercise, by cold or heat or flies or excitement of any kind, and to producing meat or milk. It follows that the large, deep barrel is a good sign, because it indicates great storage and digestive capacity. The rising pelvic arch, the high arching flank, and the thin thighs indicate that the animal was designed to carry a generous udder, and has the necessary equipment for supplying such an udder with the material for keeping it at work. The illustration does not show as much of an incurving thigh, as we would like to see. This may be due partly to the retreating rump, and partly to the position in which the cow stands.

A PRACTICAL OBJECT LESSON.

In the Dairy Hall, at the recent Minnesota State Fair, were hung the pictures of two cows. One of the cows gave last year 9,111 pounds of milk, which made 493 pounds of butter at a cost of 4.27 cents a pound. The other one gave 4,099 pounds of milk, which produced 197 pounds of butter, or thirty-seven pounds more than the average yearly product of the cows of the state. This cow's butter cost 10.85 cents a pound. These two cows belong to the state farm herd. The latter is a typical "general-purpose" cow in the amount she earns. The first cow produced over 100 per cent more than the other. Is not the lesson a plain and valuable one for any farmer to learn who keeps cows?

GRACE PIETERTJE PAULINE DE KOL 42845, H. F. H. B.

Property of W. P. BISSELL, Oneida, Iowa,

THE CHEESE QUESTION.

HOARD'S DAIRYMAN publishes an article advocating cheese as a substitute for meat, and tries to show that if cooks gave more attention to cheese for their prepared dishes, they could produce with it the equivalent, if not the superior, to meat dishes in both nutritive and appetizing qualities, and to the great advantage of cheese in the matter of cost. The *Hotel Monthly* believes that cheese is greatly neglected as an article of every-day food, but the fault lies with the dairymen. If they would produce a better article of cheese than they now do, and combine to keep out of the market the nasty, unwholesome stuff that masquerades as cheese, they will gain their point to make cheese popular. It will not take long to educate the public to a habit of cheese eating, if only they can buy it with the assurance that it is clean, free from artificial coloring and adulterants and genuinely wholesome.—*The Hotel Monthly.*

Some of the above statements are pertinent and some are not so. For instance, it is always pertinent to advise better quality in cheese or other foods, for good quality promotes consumption, and bad quality retards it. But it is not true that the dairymen are to blame for the hotel not having good cheese. The cheese is used too young, half the time before it has developed a cheese taste, and while it is tough and indigestible. The grocers to-day are more to blame than any other set of men for the poor quality of cheese. They will not show the enterprise to buy up a number of good, green cheese at a time, and fit up a curing room, where the goods can be kept at an even temperature, of say, sixty-five degrees, daily looked after, turned and greased. Of course they must have cheese constantly on hand, but they make no effort to sell cheese that has become cheese.

In the winter there is no difficulty in procuring good, well cured cheese, for it has been kept long enough after cheese making has stopped in the fall to be cured to an eatable condition. If hotel men will devote a little individual enterprise to this matter, they can have good cheese for their guests.

Wisconsin cheese is clean, free of adulterants, and the coloring matter, when used, is clean and wholesome. But no cheese on earth is fit to use in its young, immature state, and this essential feature of cheese-making, selling and eating seems to have escaped public attention.

THE STARTER IN CHEESE MAKING.

Undoubtedly there is a place for the "starter" in cheese making, but it requires the highest degree of discretion to make proper use of it. It is like the razor, useful and safe in the hands of an expert, but dangerous when used by the ignorant and careless. Indeed, the starter is so frequently misused, and to the detriment of the quality of the cheese, that not a few buyers strongly oppose it. Mr. DeLand, of Sheboygan, is of this number, and it must be confessed that the opinion of a man with his experience, both as a maker and dealer, is entitled to the highest respect.

Recent reports from cheese instructors give several instances where makers are seriously impairing the quality of their cheese by using too much starter. For example, writing under date of September 29th., instructor Baer says: "At this time of the year, when milk comes in unmatured and cold, makers are apt to use a heavy starter, to hasten the ripening process. When this is practiced, the cheese invariably cure out with a weak, pasty body, color mottled, or cut to a dull, white shade."

The day before at another factory, he reports the maker using five per cent of lactic acid starter, and says this was, at least, four times as much as the milk would stand.

At still another factory, which he visited September 30th, the maker was using a starter with more discretion, and without any bad results as yet.

And so we say to cheese makers, if you use the starter at all, be sure that it is perfect in quality, and remember that too little is infinitely better than too much. Better give an extra hour's time to the curd than cut down the quality of your goods.

A GOOD DEAL TO LEARN YET.

Just as long as there exists this wide difference in the profits per cow between different dairymen in the same neighborhood, and patrons very likely of the same creamery or cheese factory, so long will there be plenty of missionary work for the practical dairy paper, and all other agencies of a better dairy education. One of our neighbors pithily expressed it to us the other day as we were attending an auction.

"Fifteen years ago," he said, "you would not see the farmers bidding forty to sixty dollars for a first-class grade Jersey, Guernsey or Holstein cow, as you see them here to-day. It has taken lots of talking and reading and much experience for these men to become the keen discerning dairymen they are now. When I see how many of them, however, are from ten to twenty dollars behind in the profit per cow what other men are right along side of them, I think there is a good deal to learn yet."

MORE EVIDENCE AGAINST THE AVERAGE COW.

Mr. John B. Conner, chief of the Indiana Bureau of Statistics, has published a report of the production of milk and butter in that state for the past year. From every source it was possible to obtain knowledge, he discusses the final conclusion that the 492,680 cows of the state have produced 15,126,758 gallons of milk more than was produced last year. The average number of pounds of butter to each cow, however, is between sixty-two and sixty-three. It is said that a "good cow" ought to produce between 200 and 300 pounds of butter in a year. Less butter was made this year than last year. This fact, as shown by the reports, Mr. Conner thinks, shows that Indiana is sending out vast quantities of milk to large cities like Chicago. This is further corroborated by the fact that the counties near these cities show a great production of milk and small production of butter.

How much longer shall this wasteful sort of a cow continue to punish the farmers of Indiana, before they wake up to the fact? She evidently has them well hypnotized at the present time.

Cooling Cream With Ice.

When the judges were scoring the butter entered in the last contest conducted by the Genessee Salt Company, they found several tubs containing a flavor, which they said, one would find in a stagnant pond. They didn't know how the flavor got into the butter, and so did not attempt to tell the makers of the butter how to correct this fault. The latter were told, however, of the nature of the flavor, and were advised to make thorough search for its cause. Recently, during a visit of a Chicago dealer to the country, he received what he considers the correct explanation of this stagnant pond flavor. A butter maker upon whom he called, was telling of another butter maker in his county, who had sent for him to come to the factory, and assist in a search for the cause of a flavor that was injurying the creamery's butter, and destroying its reputation. "I went," said the butter maker, "and when I reached the other creamery, I was told that the commission house receiving the butter was complaining of a very pronounced flavor in the butter resembling the odor that comes from a stagnant pond. I broke a piece of some ice in the creamery, and from the taste I got when I put the ice into my mouth, I concluded immediately that I had found the source of the trouble. I asked the butter maker where he got his ice, and was told that it had been taken from a nearby pond. I then asked if he was using ice in his cream, and when he replied in the affirmative, I was sure my conclusion was correct. There was that taste of stagnant water in the ice, and, of course, when the ice was put into the cream the bad flavor was communicated to the butter. Now the butter maker is not permitting his cream to come in contact with the ice, and is having no more complaint from the commission house about bad flavor.—*Chicago Produce.*

REMITTANCES RECEIVED—NAMES OMITTED.

We are receiving quite a number of "coin-card subscriptions," where the sender omits to give either his name or address, and, therefore, fails to receive the paper according to expectation.

If any reader of HOARD'S DAIRYMAN, knows of an instance where the paper fails to arrive in two weeks after remittance is posted, it will be considered as a distinct favor, if he will promptly notify us.

HOW CAN IT BE DONE?

A great many farmers are skeptical as to the practicability of teaching the elements of agriculture to their children in the common schools. They will comment on the question somewhat in this wise:

"How can you teach my boy how to plow or sow or reap or milk, in the district school? All I know about farming I had to learn by doing the work of farming on a farm."

Their very idea of the matter shows a lack of comprehension, to start with. It is not all of farming to know how to do the work of the farm. There is a vast deal of knowledge and judgment that must come in play besides the work. There is a *science* in farming as well as in other things. And nowadays this science is discussed in books and papers constantly. Every successful farmer must learn somehow and somewhere of the science of soil management, the science of cultivation of crops, of the science of live stock breeding, feeding and management. He must study the *how* and *why* somewhere, or else he is no farmer, no matter how well he can handle the tools. To study the *how* and *why*, in other words the right theory of farming in its many branches is what constitutes the science of farming. The foundation elements of this science is what we hope to see taught to every farmer's boy and girl in the common schools.

There is not a farmer in the land but must see how greatly it would have helped him, as a farmer, if he could have been intelligently taught in his childhood the scientific meaning of the elements of agriculture. When he came to do the work of farming everything would have had a wider and deeper meaning. When he picked up his farm paper or any of the books which treat of farming, how much more easily would he understand the meaning of the terms used, if he had been taught their meaning when a child.

There is a science of numbers called arithmetic. Every man knows how important it is for the farmer to know how to reckon in figures. In order that he may use arithmetic to his own advantage when he comes to be a man, he is taught the theory of numbers when a child. He trains his mind to see figures and handle them. It is the principles of arithmetic that his mind is trained in. When he comes to be a man and farmer, all this training shows in better accuracy, better judgment, quicker adjustment of himself and his fortune. No man will say that he would have made a better hand at arithmetic if he had never studied the principles of arithmetic when a boy in school. On the contrary, we see all around us farmers who are weak in figures, who cannot reckon out their own true interests, all because they did not study figures or the principles of numbers, when young. How many thousands of creamery patrons there are to-day who cannot figure their own percentage of milk and butter in the general pool, because when a boy they did not study percentage in the arithmetic.

They find themselves barred out at many places and denied their store of useful knowledge because when they were young they did not receive the education they should. Running all through this business of farming are principles just as much as we find them in arithmetic. It will prove a big advantage to us in after life, if, when we are young, we can be taught the meaning and effect of some of those principles.

It will help us greatly when we read books and papers that treat of these principles and their effects, if we recognize and understand the meaning of the terms used to describe those principles.

The place to begin teaching the farmer's boy and girl the science of agriculture is in the district school. With the right kind of a text book, well illustrated, one that will help teach itself, they can learn a vast deal concerning the why of that they see worked out every day on the farm. This cannot but add to their interest in farm life. It becomes something more than mere drudgery. Then, beside, they will see the greater certainty of a better profit on the labor expended when that work is done with an intelligent understanding of what it means. Men and boys do their work with much greater zest and cheerfulness, when the brain is enlisted in an understanding of the reason of things.

We are glad to note that the State of Wisconsin has made agriculture one of the prescribed studies in its Normal Schools, and it will not be many years before ability to teach the rudiments and terminology of agriculture will be required as one of the conditions for obtaining a teacher's certificate.

MILK PRESERVATIVES.

Those manufacturers who are sending out their poisonous milk compounds, have a way of assuring the milk producer that it is entirely harmless, and some go as far as to say that their stuff will aid digestion. This is all humbug, and is said in order to make a sale. Dairymen cannot afford to cast aside the teachings of honest men of science on this point.

There are certain chemists who sell themselves for money to all sorts of fraud and counterfeit mixture, but we do not call them men of science. Take, for instance, the words of that eminent bacteriologist, Dr. H. L. Russell, whose contributions have been running through the DAIRYMAN for over a year. On this point (of milk) he said in the DAIRYMAN of August 5th, 1898:

"In a great majority of cases what will kill bacterial protoplasm will, likewise, exert a deleterious effect on human protoplasm, particularly when used systematically, and in quantities that are often recommended. The true nature of such chemicals *is not usually made known*. No one would, willingly, prefer to have the milk he used drugged in such a manner, if he knew it, particularly if he was going to use it with young children, whose systems are much more sensitive toward the action of drugs than adults."

Dr. Russell uses the word "protoplasm." Webster explains this word as follows:

"The viscid and more or less granular material of vegetable and animal cells, possessed of vital properties by which the processes of nutrition, secretion and growth go forward; the so-called "physical basis" of life."

In plain words, any chemical that will destroy the bacteria in milk, and prevent its souring, will, if taken into the stomach, injure digestion. This fact is proved, not only by scientific physiological reasoning, but facts of experience attest it as well.

No true farmer and dairyman will be dishonest and criminal enough to poison the milk he serves to his customers. If he is a true dairyman, he will have a conscience in his work, an honest standard of cleanliness, whereby he can keep the milk he sells pure and wholesome for food. The more he strives to work out on this honest, cleanly line, the better will his milk suit his customers.

More than this, no man has any business to sell milk, and be ignorant of the effect of his own action on that milk. He has no excuse for ignorance. Knowledge is abundant all around him and it is cheap.

The law is strong and specific against using chemicals in milk.

The milkman can know the law if he desires. In many cases he does not desire to. He is after money, whether it is honest or dishonest.

His ignorance in such cases is a crime against society. It is an old maxim in law that "ignorance of the law is no excuse for disobeying the law."

That maxim ought to be enforced in these days of cheap and easily procured knowledge when "he that runs,"—even,—"may read."

INQUIRIES AND ANSWERS.

Every inquiry must be signed with the name, Post-office and state of writer. Condense the questions into plain specific inquiry. Be careful to note if your questions have not been answered in replies to others. We are glad to answer all the pertinent questions that we can concerning machinery. Look over our advertising columns and write to the advertisers.

FEEDING STANDARDS FOR MILCH COWS.

Dry matter.	DIGESTIBLE NUTRIENTS *Protein.*	*Carbohydrates.*	*Ether extract.*
lbs.	lbs.	lbs.	lbs.
23 to 28	2.0 to 2.5	12 to 15.0	0.5 to 0.8

OAT FEED AND BREWERS GRAINS.

We wish some information regarding this oat feed. Dealers are pushing the sale of it here, at $14.50 per ton. Think it can be bought in car lots for $13. What is its feeding value for milch cows; also, what is the analysis of wet brewers grains?

We thank you for the article in a recent issue of your valuable paper, concerning our learned Board of Health, of Rochester. Think if they received a copy they might repeal their ordinance and apologize to the milkmen of Rochester. S. B.

Brighton, N. Y.

Bulletin 56 of the Hatch Experiment Station, (Mass.) issued November, 1898, after giving analysis of several samples of different "brands" of oat feed, says:

"Oat feeds, as is well known, consist of the residue from the oat meal mills. They are liable to show wide fluctuations in feeding value. Oat feeds average about 46 per cent hulls and 54 per cent of fine material. Quaker Oat Feed runs fairly constant in composition. Farmers are cautioned against purchasing oat feeds not *marked or guaranteed*. Many of the analyses given above show only five to seven per cent of protein. Such feeds have a *very inferior feeding value*, and are not worth over one-half as much as corn meal."

Quaker Oat Feed averages, in these analyses, 10.11 per cent protein, and 3.21 per cent fat. Brewers grains (wet) average 3.9 per cent protein, 9.3 per cent carbohydrates, and 1.4 per cent fat.

IS THIS A FRAUD?

Mr. Thomas Sharpless, of Pennsylvania, sends us a circular of the Antizyme Company, of Ohio, setting forth the merits (?) of Antizyme. According to this circular, the preparation has innumerable good qualities and no bad ones. We quote from the list as follows:

"1. As it prevents the development of diseased germs, it promotes good health."

"2. By arresting fermentation, it produces more cream and holds it longer, insuring a better butter product."

"3. It prevents milk and cream from souring, and butter from becoming rancid."

These are not all, but enough and possibly more than enough, and Mr. Sharpless appends the searching inquiry: *Is this a fraud?*

As we know nothing whatever about "antizyme" except what the circular states, it would be rather presumptuous for us to return a direct answer to the question, either in the affirmative or negative. We may say, however, that we have no confidence whatever in the claims advanced in its behalf, and in the light of the testimony of reputable and disinterested scientists we do not see how any honest dairyman can use any preparation for which such claims are made.

HARVEY'S ANTI-SUCKING BIT.

Kindly tell me can a cow eat and drink when wearing the Harvey Anti-sucking bit, or has it to be removed to feed. G. K. W.

Toronto.

We have not had occasion to use this article and therefore cannot speak from experience. It is reported to us that the bit does not seriously interfere with either eating or drinking, and, we are sorry to say, it has not proven effective to prevent self-sucking in some extreme cases.

FROM A NORTH DAKOTA MILKMAN.—RECEIPTS PER COW OVER ONE HUNDRED DOLLARS.—HOW SHALL HE FEED.

I did think I knew something about feeding cows, but I don't know what to do now, and would be pleased if you can help me out.

I have oat hay and wild slough hay. Ground oats are worth twenty-five cents per bu.; bran, twelve dollars per ton; shorts, thirteen dollars per ton; oil meal, one dollar per cwt. I sometimes get wheat screenings, forty cents per cwt., but it is not always the same, sometimes it's nothing but weed seed.

For roots, I have mangels, sugar beets, carrots, and rutabagas; would like to know how I can feed such for milk.

Cows have been doing very well until lately. One gave ten thousand pounds of milk last year, and they were all doing better this year than last, until lately. I have sold between eleven and twelve hundred dollars worth of milk in the last nine months from ten cows. I always have trouble in the fall;

am afraid the silo would freeze up in this country; the ground freezes eight feet deep.

Do you think the frosted grass in the pasture would hurt the cows?

Would be thankful if you could suggest something that will help me.

Condo, N. D. G. L. M.

This inquirer knows that wild slough grass hay is not first-class material for milk making. Neverthless if one has it and cannot sell it, more or less of it must be fed. He also knows notwithstanding his disclaimer, how to feed and manage cows under all conditions, otherwise he could not secure the returns he reports. He appears to be one of that increasing number of cow keepers, who are more inquisitive the more they know.

Situated as he is, we should feed about as follows, or at least try it for a time and change as results seem to indicate:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
10 lbs. oat hay	9.11	.43	4.64	.15
6 lbs. bran	5.29	.75	2.32	.18
4 lbs. ground oats	3.56	.37	1.89	.17
2 lbs. oil meal	1.82	.59	.65	.10
25 lbs. roots	1.82	.22	1.10	.02
Totals	21.60	2.36	10.60	.62

Add to the above all the slough hay the cows will eat.

We do not, as a rule, recommend oil meal with either silage or roots, but in this case oil meal furnishes protein for less money than any of the other feeds named.

We should not hesitate to build a silo any where in North Dakota. Frosted grass is of little account, and probably does more harm than good.

DOES IT PAY TO HUSK AND GRIND CORN.

Is it best to cut your corn before husking and then feed the whole product, or husk it, then cut the stalks, grind the corn and feed with bran? In other words, is the gain made in grinding equal to the time of husking and grinding, as compared with feeding the whole product run through a feed cutter?.

F. S. H.

Freeborn Co., Minn.

It is quite impossible to give a specific answer to this inquiry because of the ever changing conditions and circumstances. There is inevitably some waste in feeding whole corn, as many of the kernels pass through wholly unbroken. When corn is very cheap, and especially if hogs can be utilized to recover this waste, it certainly will not pay to husk and grind. On the contrary, when corn is high in price and there is no way to save the waste—and especially when the corn gets to be exceedingly dry and flinty—it may pay to husk, and instead of grinding let the ears soak in water until the kernels are materially softened. This looks like a "big job," but some of our friends have tried it, for both cows and hogs, and feel sure that it pays, especially as it is much less trouble than at first appears.

REMEDY FOR COW POX.

Please inform J. C. W., of Vermont, that the quickest and simplest remedy for cow pox is to wash the teats two or three times a day with a solution of one-half an ounce of hyposulphite of soda in a pint of water. A cheap, quick and effective remedy. Also wet his hands with above before milking.

Owego, N. Y. E. H. MILLER.

PASTEURIZING SKIM MILK.

The creamery to which my milk goes receives only once each day—in the morning, and the first patron to arrive, unless willing to wait a long time, must take milk separated the day before which, always very sour, is little better than whey. Now, is it not both possible and practicable for a creamery operating separators by steam to connect pipes with the separated milk vat and heat (pasteurize) it to such a degree as to preserve sweet until the following day? B.

Potsdam, N. Y.

Undoubtedly it is both possible and practicable for a creamery to pasteurize the skim milk, and in our opinion this will be the rule in the not distant future. This is one of the best ways to prevent the spread of tuberculosis and will also do much towards suppressing the scourge of calf cholera. It is practiced at several of the Kansas creameries now where the raising of calves is of almost as much importance as the making of butter.

Will not some of our Kansas readers tell how it is done and the results.

NOTHING BUT CORN STOVER FOR ROUGHAGE.

I have been one of your six months subscribers and am so much pleased that I enclose one dollar for renewal. I also would be very glad for some help on that ever present and important question—feeding. Hay was a very short crop and I have nothing but corn fodder. Bran is $14; oats, twenty-five cents per bushel; linseed $30 per ton; gluten meal, $18 per ton. What and how much of these can I feed at a profit with butter at about tweny cents.

Holland, Mich. C. H. H.

Well cured corn stover makes pretty good roughage. It is not as good as clover hay, or as first-class timothy. It is best prepared by "shredding." This may be done by running it through the cylinder of a common threshing machine, with the concave well lowered or entirely removed. This is not as good as a regular shredder, but much better than nothing. If neither machine is available, use a cutting box (this is what we do) and cut enough at one time to last several days. Dampen it more or less, as may be necessary, and leave it in a heap to heat and soften. A daily allowance of twenty-five pounds of stover with five pounds of bran and four pounds of gluten meal will make a very satisfactory ration. This amount of grain will cost only ten cents and ought to afford a fair profit with even average cows when butter sells at twenty cents. With better cows add some oil meal and note results.

QUESTIONS ABOUT NORTHERN WISCONSIN.

1. Is northern Wisconsin adapted to dairying, and would you advise a man to go there?

2. Is the climate not too cold for one raised here in Iowa?

3. Do you know of a good locality, or is there good land in all counties?

4. Would you prefer it to the far south? Land is too high in price here, $75 to $80 per acre. I wish to go where I can buy for from $5.00 to $10.00 F. W. L. S.

Long Grove, Iowa.

1. Many portions of northern Wisconsin are splendidly adapted to dairying—none better in all the world—but it is not our province to advise anyone to locate there in preference to other sections of the country.

2. The climate is not considered severe by those who reside there, whether they formerly lived in Iowa or further south.

3. There is no county, to our knowledge, that does not contain large areas of good land.

4. Every climate and country has its advantages and disadvantages. If a resident of Iowa or Wisconsin should incline to go to the far south, we know of no considerations that could be properly urged to dissuade him from doing so, although we might be well enough satisfied here. This matter of selecting a home involves so many purely personal preferences, that what determines one's choice would have little weight with another.

MILKING SHORT HORNS.—WHERE CAN THEY BE HAD?

Can you give me the address of a herd of good milking strain of Short-horns? They used to claim such a thing and some of them did do pretty well, so I thought. It seems hard to get just the thing for a special-purpose herd. E. A. T.

Fulda, Minn.

We have some doubt whether there is in the United States or Canada to-day any such thing as a milking strain of Short-horns. That there are some very excellent cows in this breed is most certain, and that there are still more excellent cows in which Short-horn blood predominates, does not admit of controversy, but if there is any breeder af Short-horns who makes dairy ability, and much less dairy form, a factor in his scheme of breeding we have never chanced to hear of him. If he exists, he is not seeking dairymen for customers; he does not advertise his stock or report what successive generations have done in the way of producing milk and butter. We do indeed hear, now and then, of some cow that makes a good record, but not of any bulls that are distinguished for a line of milking heifers, and it takes both cows and bulls, and then closely related, to make a "strain."

It goes without saying that our ignorance does not prove the non-existence of a milking strain of Short-horns, but it suggests at least that such animals are not very plentiful. There is certainly a demand for such a class of cattle—but whether founded on sound reasoning is another question—and the man who can furnish young Short-horn bulls with a pedigree tracing through sire and dam to cows with records of twelve pounds or more of butter in seven days, has a bonanza, and he ought to have the enterprise to work it, by letting the dairy farmers of the land know that he has such stock.

WITH PLENTY OF GOOD SILAGE.

Thanking you very much for the answer in the article on Crimson Clover, page 649, I would like to bother you for a balanced ration from the following feeds, as there has been none that would quite fit my need:

First, plenty of silage (in splendid shape); second, plenty of good clover and oat and pea hay; third, cotton seed meal, $20 per ton; fourth, bran, $13; fifth, corn, 30c per bu. Have our own mill.

Decatur, Ill. F. C. B.

We feel very confident that the following, as an average daily allowance, will prove very satisfactory:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
30 lbs. silage	6.27	.27	3.39	.21
10 lbs. hay	8.47	.68	3.58	.17
2 lbs. cotton seed meal	1.84	.74	.34	.18
8 lbs. corn and cob meal	7.12	.51	5.04	.28
Totals	23.70	2.20	12.35	.84

We have omitted bran from the formula because it is relatively the most expensive of the feeds named at the prices stated, and is not specially needed as a diluent for the other grain feeds, provided they are fed in connection with the silage night and morning. For some of the larger milkers two to three pounds of bran would probably make a profitable addition. Or a half pound of cotton seed meal may be added. We have also specified corn and cob meal on the assumption that the mill will do this sort of grinding. If it will not do this, but only grinds shelled corn, making what is known as corn chop, we would advise feeding six pounds of the corn and two pounds of bran in place of the eight pounds of corn and cob meal. There is no great difference probably in the varieties of hay named, so far as chemical analyses can determine, and they may be fed interchangeably. More or less silage may be fed. If there is enough to carry over a good supply for next summer's drouth we would feed so as to secure this most desirable end, reducing the winter allowance if necessary by five to ten pounds. On the other hand if the amount on hand is ample for both winter and summer the allowance may be increased by five to ten pounds—in either case increasing or decreasing the allowance of hay tocorrespond. While we specify a given amount in order to get approximate figures, the true rule is to feed each cow all the roughage she will eat with relish, be the same more or less.

Give a scant tablespoonful of salt with each feed of grain.

AN INDIANA RATION.

Please give me a ration formula from corn fodder, bran, and corn meal; also for the fodder, bran, meal and oil meal. I have been feeding a peck of bran and half gallon of meal, besides the fodder. I would like also to know how much salt you think it is advisable to give cows, and how often? Also, would you mix all of the above ration ingredients together, with water, and let same stand a little time?

Some men may "know it all," but to a beginner, the DAIRYMAN is certainly invaluable. H. H.

Indiana.

With only corn stover for roughage we do not think it expedient to try to get along without the oil meal, and hence we submit only one formula, as follows:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
25 lbs. corn stover	14.90	.43	8.10	.18
6 lbs. bran	5.29	.75	2.32	.18
3 lbs corn chop	2.67	.24	2.00	.13
2 lbs. oil meal	1.82	.59	.65	.10
Totals	24.68	2.01	13.07	.59

We are impressed with the conviction that this inquirer would do well to investigate the gluten feed question and try five pounds of that in place of the corn chop and oil meal.

Chop the corn stover and dampen it sufficently to cause it to warm up considerably in twelve to twenty-four hours, and in feeding, mix the grain allowance with a part of this chopped fodder. This will not only make the fodder more appetizing but will materially assist in causing more perfect digestion of the grain. There is great loss in the aggregate in concentrated grain feeds passing off through the bowels undigested, from the fact that as usually fed they lie in a semi-solid mass, not easily acted upon by the digesting fluids.

The more general practice is to give cows salt twice a week, but it is much better if given daily, and still better if mixed with each meal. In the latter case a small tablespoonful will suffice.

AN IOWA RATION.

Please formulate for me a ration from the following materials: Corn silage, clover hay, corn fodder, wheat one-fourth and oats three-fourths. Can buy bran at $12, and oil meal at $23. I want to use as much ensilage and the grain mixture as possible, and clover hay not over six pounds per day. I have, also, corn, barley and oats which will sell respectively at 25, 30, and 19 cents.

I appreciate the DAIRYMAN very much, and especially the columns devoted to these inquiries. B. P. N.

Cresco, Iowa.

To solve this problem, we take first the items that are to be used about to the maximum, and ascertain what they will furnish, as follows:

	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
30 lbs. silage	6 27	.27	3.39	.21
6 lbs. clover hay	5.08	.41	2.15	.10
10 lbs. corn stover	5.97	.17	3.24	.07
6 lbs. grain mixture	5.35	.57	3.17	.22
Totals	22.67	1.42	11.95	.60

This leaves us more deficient in protein than in the other elements, and we must, therefore, look for some feed relatively high in protein. We can get this protein for less money in bran than in any of the other feeds named—unless it be the oil meal. Adding two pounds bran and two pounds oil meal, we get the following figures:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
Totals as above	22.67	1 42	11.95	.60
2 lbs. bran	1.76	.25	.77	.06
2 lbs. oil meal	1.82	59	.65	.10
Totals	26.25	2.26	13.37	.76

So far as nutrients and efficiency are concerned, we could scarcely expect to improve on this as an average for a herd. The further question is that of expense.

There are starch and glucose factories in Iowa, that have large quantities of gluten feed to sell. Some of this finds its way to Wisconsin and much further east, and is considered an excellent and cheap feed for milch cows. Four pounds of this gluten feed would be just about equivalent to the two pounds of bran and two pounds oil meal, and if it costs less we should advise trying it.

A FIELD MEETING OF CONNECTICUT DAIRYMEN.

The second field meeting of the Connecticut Dairymen's Association was held September 6th, at the farm of Elbert Manchester, near Bristol. About one hundred gathered on the farm of Mr. Manchester, and the morning was spent in looking over the dairy establishment, and also the farm of S. D. Newell, near by. Dinner was served under a large tree about 2 o'clock. J. B. Noble, the State Dairy Commissioner, delivered an interesting address, in which he gave those present considerable advice from a professional standpoint. H. G. Manchester, a dairyman from Winsted, was the next speaker. His theme was, "Abandoning the Farm," and he said, farming could be made to be a paying vocation, if its followers would keep abreast of the times. "Silos and Double Cropping" was ably discussed by J. L. Gerrish, of New Hampshire. Prof. Mayo, of Storrs Agricultural School, was the last speaker.

We like this idea of summer meetings of dairymen, and the practice could be very profitably copied by the associations of other states. No better work was ever done by any state association, than that of the New York Dairymen's Association a few years ago, in its traveling Butter Schools.

A STRIKE AMONG DAIRY FARMERS.

The farmers of Putnam and Dutchess counties in New York, who have, for years, supplied the Borden Condensed Milk Co., at its factories at Brewster, Wassaic and Millerton, have, eighty per cent of them, refused to accept the prices offered by the company.

During the past summer the producers, and there are fully 500 of them, have received little more than 50 cents a can, or 1½ cents a quart net for their milk.

During the past ten months the farmers have been organizing, and yesterday when the company made its offers for the next six months, and presented contracts for the producers to sign, they refused the offers made, which were $1.33 a hundred pounds for six months. The farmers demanded $1.40.

The producers say the prices paid have been so small for six years that many farmers today have trouble in making both ends meet; in fact, seven-tenths of them have their farms mortgaged.

It will be useless for the New York farmers to contend against the Borden Co. unless they go practically at work to provide themselves with an outlet for their milk. This they can do, if they choose, by organizing co-operative creameries for every 1,000 cows. These farmers will find if they do this that the value of the butter, and the skim milk fed to pigs and calves, together with increasing fertility of farms, will pay them better than selling milk to the condensaries. The farmers in Wisconsin, Illinois, Iowa and Minnesota, who follow that style of dairying, are not putting mortgages on their farms. On the contrary they are lifting the mortgages.

A FAR FETCHED COMPARISON.

Take a quarter horse, measure off a hundred yards and send him at the top of his speed, under whip and spur, over the measured space, note the time in which he covers it; then figure out how long it would take him to make a mile at that rate; then offer that result, as a track record, to any jockey club. The result will be an explosion, accompanied by sulphurous language as to your lack of horse sense. There is not a turf man in the world that would not pronounce such a proposition an absurdity, nay, worse, a fraud in its very essence. Yet such a proposition would not be a particle more absurd, not a bit more fraud, than is the attempt to make a butter record for a cow on a thimbleful of milk, run through a Babcock machine.—*Jersey Bulletin.*

In the mind of the *Jersey Bulletin* cows are divided into two classes, the Jersey and "others." By some occult method of reasoning, he has decided that testing a Jersey cow with the churn is a sacred and mystic rite that has become like unto the laws of the Medes and Persians, which altereth not. Consequently, in view of the proposal of other methods which would result in pulling down the churn from its high seat, as the arbitrator of the cow and her butter production, we have the quotation at the head of this article. It matters not to the *Bulletin* that all the great commercial products of the world are tested in just such methods; that Rockefeller buys millions of gallons of oil by the analyses of a sample; that sugar, iron, coal, ores and products innumerable are bought and sold by such tests as the *Bulletin* so scornfully rejects as unworthy of the mythical sacred animal which it represents. The comparison of the horse at full speed and a spoonful of milk taken as a sample for analyses, is so far fetched that it is ludicrous. The cow has accomplished her work and the milk is the result. It is resting peacefully in the pail; the fat is not making a speed burst against time, and to say that such milk cannot be sampled and its per cent of fat determined merely shows mental strabismus, on the part of the *Bulletin* editor.

AMERICAN BUTTER IN CUBA.

The dairy industry has two powerful enemies to fight: Ignorance and Dishonesty. Through ignorance, bad butter, cheese and milk are produced, and that hurts the consumption fearfully. Whatever hurts consumption injures the producer, for it turns his product back onto him. Dishonesty is everywhere. The cheat and swindler, the man who is trying to get something for nothing, is continually with us.

Therefore, it is a constant hand to hand fight with these two enemies to keep the dairy industry from being overwhelmed.

The Milwaukee *Sentinel* has the following sound utterance to make on the American butter trade in Cuba:

The statement that American butter sells in Cuba at from $20 to $40 Spanish gold per hundred weight, while Danish, Holland and French butter sells at from $40 to $60 per huudred pounds, casts a reflection on our butter exporters that it should be their duty to remove. Secretary of Agriculture Wilson says that it is probable that the export of oleomargarine has caused the Cubans to be suspicious of American butter. Whatever may be the reason, it is extremely likely that they have sufficient cause for preferring European butter to that sent from this country. It would be natural for them to buy American butter, because the supply comes from a source so much nearer to them, and because their preference is likely to be for American goods, providing the quality and the price are satisfactory. When they are willing to pay considerably more for European butter, it is direct evidence that there is something the matter with our butter.

One would think that our experience in the British market, where we formerly sold our dairy products very extensively, ought to have taught exporters of such products a lesson. We lost the advantage we had obtained in the British market, solely on account of the dishonesty of some of our exporters in selling adulterated articles, such as filled cheese. The British public having lost confidence in the genuineness of our dairy products, we suffered a great decline in our exports of this kind. Doubtless the same class of men are responsible for the discrimination against American butter in Cuba. They thought they had found a dumping ground for the inferior stuff they had failed to place in other countries. But the Cubans, like other people, do not take to frauds. This experience shows once more that honest trade methods are required in every country to promote our commercial relations. It never pays to put an inferior article on any market, if one is seeking to develop trade.

We need to preach plain, old-fashioned honesty more than we do in all our creameries and cheese factories. There are too many farmers who are ready to cheat all their neighbors by sending dirty milk, or by watering and skimming, and lastly, by robbing them of their share of the skim milk.

Then comes the dishonest manufacturer who makes "process butter," and the dishonest dealer who ruins the best markets by counterfeit and low grade products.

Is it any wonder that the great fraud oleomargarine should thrive apace, when the people themselves are fairly honeycombed with dishonesty, and are so ready to wink at any fraudulent scheme that will make money?

New York Farm and Dairy Notes.

The Fall Care of the Dairy Cattle.

ED. HOARD'S DAIRYMAN:—It may seem too much like an "old chestnut" to again take up the old subject of providing suitable shelter and food for the cattle when the cold weather comes in the fall, but like the minister who repeated a sermon several times because his people had not begun to practice what he preached, it may be well for the agricultural papers to keep on teaching along this line, for as one goes over the country he sees that there is still need of reformation.

Dairymen make a great mistake when they allow their cows to lie out of doors nights during the cold and stormy weather we usually have in October and November. Now is the time when the cows need extra care and food. The price of milk and butter is advancing at this time of the year, and we cannot afford the loss in the shrinkage of milk that comes from exposure and the lack of the right kind of food. The shrinkage of milk is not entirely regained by extra feeding later, and because of the loss of flesh the cows are not in as good condition for winter.

When the cow is exposed to a temperature which is below that which is the most favorable for her that she may make the most milk with the consumption of the least food, the only way that she can maintain the normal temperature of the body, is to burn the carbon in the body, or in her food. The animal that is left out of doors in cold weather, with nothing to eat but the frosted grass, must consume the fat in her body to maintain her normal temperature. I have seen cattle that had become fat during the summer, lose a good part of it by exposure to cold and storm during the late fall. It certainly is not good economy to allow cattle to become poor in flesh at the beginning of winter, nor to allow the cow to use the food to make heat that would go to make milk when the external conditions are right.

As soon as Oct. 1, the cattle should be stabled nights in the latitude of New York, and given suitable food. I would feed ensilage, or dry corn fodder cut with the ensilage cutter, and balanced with a little bran and cotton seed meal, if the price was not too high, or good clover hay, and would try to make use of the products of the farm that are adapted to feeding the cows at this time of the year.

APPLES AND POTATOES FOR THE CATTLE.

In my locality we have a very large crop of apples. The crop is so large that quantities are being sold for cider apples at prices ranging from five to ten cents per bushel. This price just about pays the grower for his time picking the apples and drawing them to the car. It is a question which some are considering, whether it is more profitable to sell these apples, or feed them to the cows. Writing from experience and observation, I would feed the surplus apples on the farm, especially the sweet apples that could not be sold for a fair price, to the cows.

On our farm, when we had large crops of apples, we usually fed a part of them to the cows. The gain in milk was small, but the cows were kept in better condition by feeding apples. Nearly all animals like apples, and I believe they are healthier for having them. I would not feed more than six to eight quarts of apples per day to a cow, and for the cow giving milk it is better to feed them with grain. Apples are over ninety per cent water, and the remainder is mostly carbohydrates. Although apples contain comparatively little of the milk producing, or flesh making material, they help to keep the cows in good condition, and I prefer to feed them than take them to the cider mill, or sell them for five cents per bushel to the cider maker.

We have also a very large crop of potatoes, and the price now is but twenty-five cents per bushel. The price is so low that many farmers are considering whether it is more profitable to feed them to the cows or to sell them. From what I know about feeding potatoes to cows I would prefer to sell them and buy grain. A few potatoes are good to keep the cows in health, but they will not take the place of grain. Some farmers have told me that they have fed their cows giving milk about all the potatoes they would eat, and the milk was but little increased, and the cows grew poor all the time. Potatoes are nearly all starch, or carbon, and so are of little use except when fed with a food rich in protein. An animal can live and thrive on the proteins, but they cannot live on the carbohydrates alone, and we see why, the potatoes being an ill-balanced food, the cows grow poor when fed mostly on potatoes. Where one does not have ensilage, such succulent foods as apples, potatoes, and roots may be needed to keep the cattle healthy, and I would prefer to feed them in moderate quantities, than to let them waste, or sell them for a price that did not pay for marketing them.

"A Good Name At Home

Is a Tower of Strength Abroad." This truth has been perfectly verified by the history of Hood's Sarsaparilla, which effected its first cures in Lowell, Mass., where it is made and where it still has a larger sale than all other blood purifiers. Its fame and cures and sales have spread abroad all over the world, and it is universally recognized as the best blood medicine money can buy.

Hood's Sarsaparilla
Never Disappoints

Hood's Pills cure liver ills; the non-irritating and only cathartic to take with Hood's Sarsaparilla.

The Pennsylvania Farmer's Son and the Dairy School.

ED. HOARD'S DAIRYMAN:—The greatest and most important feature of American agriculture for the past fifteen years, has been the development of the dairy industry. Most important in its development has been the influence of carefully trained, scientific minds whose energies have been spent in perfecting apparatus and in discovering the principles which underlie the art of manufacturing the many products from milk as a raw material.

These principles of manufacture have been so simplified that they are available to nearly every one who seeks to master them. A great deal of this valuable information has been and is being disseminated by the agricultural press and by the farmers' institutes, but in no place can it be so advantageously given as in the Dairy School, where every appliance is at hand to illustrate principles, and where principles are at once applied practically.

Creamery owners are looking more and more for men to operate and to superintend their plants who have enjoyed the advantages of a dairy school, and are willing to pay large salaries for the knowledge and skill so acquired. For example, a few years ago, a young man who had been working on a farm for twenty-five dollars per month and boarding himself, spent fifty dollars in taking a course in our Dairy School; the following creamery season, he obtained a creamery at forty-five dollars per month and house rent. The next year this was increased to fifty dollars per month, the next to fifty-five dollars per month. He then secured another position along the same line for seven hundred and twenty dollars per year and recently he took a position as head buttermaker with a large firm and the salary he commands is nine hundred dollars per year.

Another of our Dairy School men is head buttermaker for a creamery supplying a fancy butter trade in New York; his butter sells for from forty to sixty cents per pound,

Finer Flavor, better quality, better price; that's what results from the use of the Champion Milk Cooler–Aerator in your dairy.

Our book about it free.

CHAMPION MILK COOLER COMPANY,
67 Main St., Cortland, N. Y.

and his salary is twelve hundred dollars per year and is constantly increasing.

In 1897, a young man who had seen but one creamery in his life before he saw the Dairy School creamery, took a dairy school training, after which he secured a small creamery for one season. He was eminently successful and at the end of the year was employed as buttermaker by a company who sold all their butter for sixty cents per pound. At the end of two years, he was recommended and received the appointment as general superintendent ot a number of creameries at a salary of $960 per year.

Still another, a member of last year's class, has charge of, so far as the writer is informed, the largest creamery in the State, handling as high as seventy thousand pounds of milk in a day. His employer has publicly stated that he considers that he has the best buttermaker in the state.

A great many of our dairy school students have positions as managers of creameries and are earning good salaries, higher salaries than almost any other calling, requiring the same amount of capital and time for preparation, would command.

This is what the Dairy School has done and is doing for some of the Pennsylvania farmers' sons, and we are all proud of the records these young men have made.

The next session of the Dairy School will begin January 4, 1900, and plans are being made to make the most complete and thorough course yet given. Beside the regular work in the handling of market milk, buttermaking, icecream making, machinery, bookkeeping, etc., it is intended to give a course in the manufacture of dried curd which is attracting the attention of so many creameries now as offering a very profitable manner of disposing of the skim milk.

The course is rapidly filling and those intending to avail themselves of its advantages should apply for admission at once.

Pa. Dairy School. H. HAYWARD.

The Value of Humus in Cultivated Crops.

All fertile virgin soils contain humus, that is, decayed vegetable matter in large amounts. Some soils—such as swampy or peaty—contain this substance in excess, but as a rule no well-drained, cultivated soil contains too much humus. Humus is to the soil what the fly wheel is to an engine. It takes up and saves surplus power, prevents waste and sudden jerks. Soils poor in humus cake badly, they lose their moisture during dry weather, become overheated during hot weather and quickly lose their heat in cool weather. In fact, such soils act upon growing plants by sudden starts, now one way and now another, with the result of injuring the vitality of the plant which demands steady growth conditions.

Humus makes light soils heavier and more retentive of plant food and moisture. It makes heavy soils lighter and easier to cultivate and prevents "puddling." Humus, too, is the home of soil microbes. Soils devoid of humus are also apt to be devoid of the microbes which transform nitrogen in the soil into compounds suitable for plant food. The immediate and great effect of stable manure upon worn, humus-poor soil is due more to the microbes and the vegetable matter which the manure contains than to the actual plant food it holds.

Any kind of vegetable matter will, by its decay in the soil, form humus. But soft, succulent matter like the stems of clover, vetches and cow peas decay sooner and more quickly form humus than woody twigs or the hard culms of rye or other grasses. When a soil becomes poor in humus the best way to restore it is to plow under a crop of clover, vetches or cow peas grown upon the land itself. Stable manure will also restore the humus if used in large quantities, but as a rule this will cost more than the green crop. In many localities stable manure cannot be had at any price in sufficient quantities. Rye, rape, mustard and other non-leguminous crops are often plowed under to improve worn soil. These will furnish humus, but for the purpose they are far inferior to leguminous plants and only the latter should be used for this purpose. Besides the humus they furnish, legumes supply the soil with nitrogen taken from the atmosphere. Rye, rape and other non-leguminous plants do not. One ton of the following named plants dried into ordinary hay furnishes to the soil when plowed under the following amounts of nitrogen:

Red Clover, 40.5 lbs., equivalent to 250 lbs. nitrate of soda.
Crimson Clover, 41.0 lbs., equivalent to 260 lbs. nitrate of soda.
Alfalfa, 43.8 lbs., equivalent to 270 lbs. nitrate of soda.
Cow Peas, 38.0 lbs., equivalent to 230 lbs. nitrate of soda.

In order to secure a good growth of any legume on a worn soil we must supply the soil with abundance of soluble potash, phosphoric acid and lime. A good fertilizer for any of the above crops is muriate of potash, two hundred pounds; superphosphate, three hundred pounds, per acre. If the land lacks lime apply five hundred to one-thousand pounds. GERALD MCCARTHY, M. S.

North Carolina.

The Duty and Privileges of Creamery Operatives.

Making Butter Not All.

ED. HOARD'S DAIRYMAN:—As I have been a subscriber to your most valuable and interesting paper for a good many years, I take the privilege of offering a little advice to such of my brother tradesmen as have not given the subject a thought. I have operated creameries in various sections of the United States, and find the same trouble everywhere. Although there are notable exceptions, the mass of patrons know too little about dairying, even in its simplest form, and, of course, much less the scientific and modern methods which ought to prevail.

Another and less excusable defect is, that the man who operates the creamery knows next to nothing about the cow, and too often too little of her product. It is natural enough, when the patron comes to the factory and sees the man in charge, to conclude that a man in such a place ought to know something about cows, but how often does it happen that the first question the patron asks leads to disappointment, whereas if the operator had some knowledge of feeding, breeding and care of dairy cows, the patron would have increased confidence in his ability. Then if the operator can visit most of his patrons, and thereby show some interest in their welfare, and as opportnnity offers, submit suggestions about the proper care of the cows, straining and cooling the milk, and various other things, in a friendly way, there will be mutual benefit. The old fashioned way of sticking a threatening note under the can cover, only makes bad matters worse.

By experience, I have found the above plan a very good one, and followed up will put life and interest into any dairy community. I always take pride in having a patron stick his head in the factory window and say, "I tried that suggestion of yours and find it all right."

Where did I get my knowledge? From the HOARD'S DAIRYMAN—the only reliable and up-to-date dairy paper published. Let every butter and cheese maker take the DAIRYMAN, and by a little observation, and the knowledge he obtains from its columns, let him lead his patrons to success.

HAROLD M. CALKLINS.

Washington, D. C.

Testing Cream by Weight.

Since the number of hand separators has increased at home daries, creamery butter makers have occasion to test a considerable number of cream samples, and this has been the source of a great many inquiries during the past few months in regard to cream testing. Evidently factories are now receiving a great deal more cream from their patrons than has formerly been the case. A request was recently made for "a rule for testing fat in cream when testing by weight." In replying to this it is well to make plain the foundation for such a rule. Three things should be remembered. First, the sp. gr of butter fat is assumed to be 0.9, i e., if one volume of water weighs 1 then the same volume of butter fat weighs 0.9. Second, the space occupied by 1 per cent on the neck of a Babcock milk test bottle or on a cream test bottle should be exactly 0.2 c. c. Third, 18 grams of milk or cream must be placed in a test bottle in order to read the result directly from the scale on the neck.

From these three factors, a rule for calculating the test of a certain weight of cream is easily constructed. If 5 grams of cream are weighed into a test bottle, 10 c. c. of water added to it and the test completed in the same way that a sample of milk would be tested, the fat in the neck of the test bottle may fill a space of 6 per cent. This figure does not mean that the cream contained only 6 per cent fat but the butter maker wants to know from these figures how much the cream actually d d test. This he can reason out about as follows: If one per cent space measures 0.2 c.c. and the sp. gr. of butter fat is 0.9 then one per cent spaces weighs 0.9×0.2 equals .18 grams. The butter fat of the test it was found filled a space of 6 per cent and this multiplied by .18 gives 1.08 grams of fat which must have come from the 5 grams of cream originally weighed into the test bottle. All that is necessary to do now is to find what per cent the 1.08 gr. of fat is of the 5 gr. of cream (1.08×100) divided by 5 equals 21.6 per cent, which is the test of the cream. From this demonstration the following rule may be formed: To find the test of a weighed quantity of cream multiply the fat reading by 18 and divide the product by the amount of cream weighed into the test bottle.— E. H. FARRINGTON, in *Farmer's Review*.

Mortgage Lifters

That's what dairymen call our light running hand separators, because they increase the yield of butter about 25 per cent. and improve the quality, which means higher prices. We **guarantee** the

A WELL REARED FAMILY.

Mr. Jesse Bradford, of Baldwin, Mich., is a dairy farmer who has supplied that city with milk for the past twenty years. He is the father of six daughters, who have in turn had charge of the delivery of his milk. All the daughters are now married, the youngest having been wedded a short time since.

The DAIRYMAN is greatly pleased to note such a wholesome training of a family as this instance evinces, and we are sure that every daughter will prove a life-long blessing to the man that showed his good sense in selecting her for a wife.

THE OLEOMARGARINE SITUATION AND WHAT SHOULD BE DONE ABOUT IT.

It is not without both regret and surprise that people have witnessed the degeneracy which has overtaken the *Country Gentleman* —for so many years, and while under the care of the original Tuckers a synonym for all that is honorable in journalism. In those earlier days it could not be made the tool of cliques or politicians or otherwise be swerved to the promotion of unworthy aims. It is yet in many respects a most admirable paper. Its editorials and contributed articles on matters pertaining to farm management and general agriculture are of high order. But when it leaves these subjects and enters the field of legislative dealings with agricultural matters its vision is not clear and in consequence its reasoning is not sound. And as is not unusual in such cases it cannot treat those who do not agree with its conclusions with fairness or courtesy, but with a fatuity which seems to be inseparable from such characters, it ascribes to others the motives which would be most potent with itself.

For example, being inquired of as to what is the oleomargarine situation at present and what it thinks should be done about it, the following reply is given:

The stuff is pretty much out of market in New York; in several other states it runs rampant. As it is practically impossible to sell *white* oleomargarine, producers and consumers of butter everywhere should unite in demanding from Congress such legislation as will permit every state to forbid the selling within its borders of this or any other food substance colored to imitate something else, whether the counterfeit be in original packages or not. This demand is manifestly just and right; and some day it will be made with such emphasis that it cannot be refused. At present, unfortunately, there is a tendency to ask for legislation which will never be accomplished—a tendency fostered in some cases by self-seeking persons who are really as little opposed to oleo as they are to its twin fraud, renovated butter.

It is too much to expect that all persons should agree upon any one plan for meeting the oleomargarine situation, but it ought not to be difficult for those who differ to do so on the merits of the respective propositions.

The plan proposed by the *Country Gentleman* above is not entirely devoid of merit and in the event that nothing better can be secured should be accepted, at least as a temporary makeshift. Some of the objections to it are that it relegates a question about which there should be uniformity of action to the determination of more than forty different legislatures, and will necessitate fighting the matter through a similar number of state supreme courts, and encountering years and years of the delays incident to litigation. Moreover, it will make it necessary for each state, which seeks to enforce such laws, to employ a corps of detectives, chemists, lawyers, commissioners and assistant commissioners, and, worse still, result at last in the prosecution, not of the few original and principal offenders, but of an infinite number of minor offenders, not a few of whom can truthfully plead that they were deceived and duped by parties whom state laws cannot reach.

To suppose a case: Let it be imagined that the editors of the *Country Gentleman* should conclude to open a boarding house in the capital city of the great state of New York, and for reasons satisfactory to themselves should send to Chicago for butter. What would happen? There is something more than a possibility that by accident, if not by design, unless the order was placed in specially competent and honest hands, an occasional tub of oleomargarine would find its way into the shipments and land in the pantry of this Albany boarding house, and from there go to the tables where only pure butter should be found. Of course, those vigilant New York officers would be quick to discover the facts and equally prompt to bring the Messrs. Tucker into court, where fines if not imprisonment would be sure to follow.

Can it be possible that there is not some better way to meet this problem, some method of procedure that shall be more certain, more economical, more expeditious and less liable to work injustice?

Or to be more specific, will not the Davidson Bill, which proposes to put an internal revenue tax of ten cents per pound on all colored oleomargarine, do this? Let a proviso be added, if it shall be deemed necessary, that nothing in that or any other act of congress shall be construed to permit the sale of oleomargarine of any description contrary to or in violation of any state law or municipal regulation.

The machinery for enforcing such a law is already provided; if contested, there will be but one series of courts to go through; absolute uniformity will be secured; the general public, honest dealers as well as consumers, will be protected; the total expenses will be cut down to a merely nominal sum—at least, fully *ninety-five* per cent—and there still remain an effective barrier against extortionate prices for butter.

With so many points in its favor why should the *Country Gentleman* say such "legislation will never be accomplished" or ascribe self-seeking motives to those who are trying to secure it?

How to Make Farm Dairy Cheese.

The ordinary process by which our American cheese is made in factories is not applicable to farm dairy cheese making, because it requires too much time, and is so complicated that it requires years of practice to become sufficiently familiar with the varying conditions in which milk comes to the vat. The various changes that take place in milk nearly all develop in the milk drawn in the evening and kept over until the following morning. So if milk is made into cheese immediately after it is drawn, no difficulty will be experienced, and by employing a simple and short method of manufacture, any one at all accustomed to handling milk can make uniformly a good cheese with the appliances found in any well regulated farm home. The best time to make farm dairy cheese is immediately after milking. First pour the milk from one vessel to another in some locality where the air is pure and fresh, raising the vessel from which the milk is poured high, so the air can pass through the milk and carry off the animal odor. Then pour the milk into the vat, or if you have no vat use a large wash boiler. It is not necessary to use cheese color, but if you desire the cheese to look rich use about a teaspoonful of cheese color to sixteen gallons of milk. To mix in the color take a large dipper, fill it half full of milk, mix the color thoroughly in it and stir it into the milk. Now add rennet extract at the rate of one ounce to a hundred pounds or twelve gallons of milk. The milk should begin to curdle in from ten to twelve minutes. If you use rennet tablets to curdle the milk take one small tablet for every five gallons of milk, or one large tablet to twenty-five gallons of milk. Small tablets are about the size of a dime; large tablets are about the size of a silver quarter of a dollar. The rennet may be procured from any creamery supply house.

To add the rennet if tablets are used, dissolve the required amount in a small quantity of cold water, then pour into the milk. If rennet extract is used mix it in half a dipper of cold water and then pour it into the milk. Great care should be taken not to have the milk at a temperature below eighty-six degrees Farenheit when the rennet is put in, and it should not be above ninety degrees Farenheit. After the rennet is put in the milk stir gently two or three minutes, then let stand until the curd is firm enough to cut. To ascertain when the curd is ready for cutting insert the index finger in the milk at an angle of forty-five degrees until the thumb nail touches the milk, make a slight notch in the curd with the thumb then gently raise the finger; if the curd breaks clean across it without many flakes remaining on the finger it is ready for cutting. A little pratice will soon tell you when is the best time to cut.

For cutting, regular cheese knives are best, one with horizontal blades and one with perpendicular blades. In case it is intended to make only a few cheese, a wire toaster may be used, the wires only about a half an inch apart. First cut lengthwise, then crosswise of the vat or boiler until the curd is cut into cubes about the size of small kernels of corn.

After you have finished, stir the curd gently for about three minutes, then heat slowly to nintey-eight or one hundred degees Farenheit, constantly stirring gently while the curd is being heated; keep the curd at this temperature for about forty minutes. To tell when the curd is sufficiently cooked take a handfull and press it gently, hold for a moment then open the hand and if the curd falls apart it is firm enough. As soon as the curd is sufficiently cooked, draw off the whey and fill the mold by taking a double handful at a time and pressing gently into the mold, continuing until the mold is full and well rounded up. Then take the cheese out of the mold and turn it upside down and replace it. Put on the cover and put to press which may be a simple, old fashioned lever press, described as follows: The lever should be about twelve feet long. We are using a broken wagon tongue and it answers the purpose very well. A pail containing a few cobble stones will answer for the weight. Regular Gouda molds are best, but any tin or wooden receptacle will answer if small holes are made in it for the whey to escape. The cheese should be from eight to ten inches in diameter and about three inches high. Set the box upon which the mold is to be placed about three feet from a wall, post or tree on which a slat is nailed, under which the end of the stick is placed. Put a circular board about six inches in diameter on the mold, on this rest the stick. Do not apply full pressure at first but let the pail hang about half way between the mold and the end of the stick. Let the cheese remain a few hours in the press then take out and dress. To dress a cheese first put it in warm water, take a piece of linen cloth about six inches wide and long enough to go around the cheese and lap over a few inches. Wrap the cloth smoothly around the cheese, folding the edge down over the sides; then put a circular cap on each side—a couple of circular cloths made large enough for a gallon butter jar, will answer—and return to the mold. Put both under the press, moving the pail to the end of the stick. Leave the cheese in the press for about twenty hours, then take out and salt.

The cheese may be either dry salted or brine salted. Brine salting is the better way. Make a solution of salt and water as strong as it can possibly be made; put the cheese in this and sprinkle some salt on the exposed surface. Leave the cheese in this for two and a half days, turning them every twelve hours. For dry salting, rub salt on twice a day for three or four days; then put the cheese on a shelf in the cellar, turning and rubbing them with the palm of the hand every day the first week or two, after that twice a week will suffice. They should occasionally be washed with a cloth dampened in warm water, and if they get a rough rind use a brush and warm water. The temperature best adapted for curing is from fifty-five to sixty-five degrees Farenheit, and the air should be as moist as possible. The cheese will be ready for use in from two to four months. The lighter the cheese is salted the sooner will it be ready for use, and the more the curd is cooked the slower it will be in ripening and the longer it will keep.

T. L. HAECKER.

Minnesota School of Agriculture.

The Recruiting Ground for Veterinarians.

ED. HOARD'S DAIRYMAN:—The relations between the agricultural college and the veterinary college should be close ones, although up to the present time few efforts have been made in that direction. The intelligent, energetic farmer's son with a love for live stock is the best material out of which to make a veterinarian, and as the time is coming when the veterinary colleges are about to open their doors for the coming winter session, a few words of advice to farmer's sons intending to take a veterinary course will not be out of place.

It is essential that the veterinary student should be thoroughly conversant with the normal habits and characteristics, methods of feeding, history, laws of breeding, etc., of live stock; consequently it is readily seen how advantageous it is to the intending veterinarian to have had a course in animal husbandry at one of the leading agricultural colleges. Whether the student intends to go into private practice, municipal or federal government work, the advantage to be derived from an agricultural course will be just the same. Today the veterinarian is often called upon to judge at the fairs and exhibitions and unless trained he cannot fill the bill; the young veternarian without the agricultural training cannot hope to fill the bill. Veterinary practice is not confined to horse ailments, hence, a knowledge of feeding, testing of cattle is desirable and necessary for the country veterinarian. The time at an agricultural college, if a graduate, is not lost, as it is credited to the student at most of the veterinary colleges. For instance, a Short Course graduate of the University of Wisconsin will be allowed one year, at the best veterinary colleges (all three year schools, shorter schools are to a great extent quack making mills). The faculty of the McKillip Veterinary College, Chicago, have recognized the agricultural students and colleges, by offering a $75 scholarship to second year men in the Short Course of the agricultural college at Madison.

To the intending veterinarian I say, there is no need of you going outside your own country for a first-class veterinary education, at least as long as the McKillip college, Chicago; Union of Pennsylvania; New York and American Colleges, New York City, keep their doors open. You may find it cheaper in the beginning and *will find it more expensive* in the long run to graduate from a two year's school. The farmer of mature years,

Just $35.00 buys a richly **butter bred** Registered Jersey Bull calf, Seven months old, solid color, and a **show** calf, inbred to the great cow, Landseer's Fancy. Money refunded if not satisfactory. Address M.A. COVODE, Noblesville, Ind.

POULTRY FOR 1900 How to make it pay better than ever, the contents of our new **POULTRY GUIDE.** Tells a thousand things every hen owner should know. **Treats the whole subject.** 180 new and original illustrations, recipes, poultry houses, etc. **Worth $25, but sent for only 15 cents to pay postage.**

JOHN BAUSCHER, JR., BOX 35, FREEPORT, ILLINOIS.

Printed Parchment Butter Wrappers

Are an established factor in the CREAMERY BUSINESS to-day.

Protect your special Brands of butter by having your Wrappers Printed.

A. G. ELLIOT & CO. are Headquarters for these Printed Wrappers and can furnish same at prices that will interest you.

Our STANDARD weight Butter Wrappers are acknowledged to be the best Butter Wrappers on the market to-day. A sample order will convince you.

A. G. ELLIOT & CO.,

Manufacturers, Importers and Dealers in Paper of Every Description.

Philadelphia, Pa.

or his son with an agricultural college education is no willing client of the quack, whether that quack possesses a diploma or not.

Wis. Agr. College, Madison, Wis.

Our Special Elgin Letter.

ED. HOARD'S DAIRYMAN:—Today's session of the Elgin Board of Trade was held in the forenoon, on account of the President's visit to Chicago, many of the members desiring to attend the exercises, consequently there was a small attendance and no business. But 1,080 pounds were offered on which 23 cents was bid before it was withdrawn. The quotation committee declared the market firm at 23½ cents.

The sales for the corresponding week of the three preceding years were as follows:

Oct. 10, '98, 7,920 lbs of butter sold at 20 cts.
Oct. 11, '97, 10,200 lbs of butter sold at 22 cts.
Oct. 12, '96, 21,840 lbs of butter sold at 20 cts.

The New York market was reported firm at 24 cents. H. C. B.

Elgin, Ill., Oct. 9, 1899.

Prof. Decker Complimented.

ED. HOARD'S DAIRYMAN:—The following resolutions were unanimously adopted by the Lone Rock and Muscoda Dairy Board at its regular meeting of Oct. 2nd.

Resolved, That we appreciate that the growth of the cheese industry and the success of our Wisconsin cheese factories are due to the persistent and tireless efforts of our capable cheese instructor, Prof. Jno. W. Decker, and we are glad to record this fact and and to express our sincere thanks for his work which has been given so earnestly to the dairy interests of this state.

Resolved, That this board regrets his removal from the force of instructors of our Agricultural College and we fully hope that those in charge may yet see fit to retain his services in the former position which he has so ably filled in the past.

J. FROST, Secy.

The Minnesota Butter and Cheese Makers Will Meet at Owatonna, November 8th and 9th.

The place and date for the holding of the annual session of the Minnesota State Butter and Cheese Makers' Association have been fully decided. The gathering will convene at Owatonna on Wednesday and Thursday, November 8th and 9th. The officers and members of the association are anticipating one of the best meetings in the organization's history. J. K. Bennett, the secretary, at Clinton Falls, Minn., will be glad to give any information desired concerning the meeting.

DAIRY MARKETS.

ELGIN, Ill., Oct. 9.—Eighteen tubs offered; 23c bid; no sales; committee reported steady, 23½c.

CHICAGO, Ill., Oct. 9.—Cattle—The choicest native beef cattle ruled steady and best grass Westerns ruled strong to 10c higher, while other natives were weak to 10c lower, the "pretty good" natives closing fully that much off. A load of 1,582-lb corn-fed Westerns sold at $6.90, with 1,501-lb natives at $6.85. Natives averaging 885@1,520 lbs sold at $4.60@6.75; bulk $5.50@6.25; corn-fed Westerns, 1,160@1,420 lbs, $4.90@6.25; grass Westerns, $4@5, with cows and heifers at $3.60@4.40; Texas steers, $3.75@4.10; native butcher stock, $1.75@5; bulk, $2.75@4; feeding cattle, $3.10@4.75.

Today's recipts are estimated at 5,000 cattle, 23,000 hogs, and 17,000 sheep.

MILWAUKEE, Oct. 9.—Butter—Fancy Prints, per lb, 23½c; extras, 23½c; firsts, 22@23c; seconds, 20@21c; imitations, 19@20c. Dairy—Selections, 18@20c; lines, 16@18c; ladles, 15@18. Market unchanged and quiet, with fair supplies, chiefly cold storage; receipts 9,535 lbs.

Cheese—American full cream, 11½@12c; brick, 11½@12c; Limburger, per lb, 10½@11c; Swiss, drum, 12½@13c; block, 12½@13c; No. 2, 10½@11c. Market firm; receipts 7,960 lbs.

Eggs—Fresh, per doz. 16½c; loss off, cases returned. Market unchanged, with receipts of 130 cases.

FOND DU LAC, Wis., Oct. 9.—Offerings 672 Twins, 480 Daisies; market firm at 12 cents for Twins, and 12⅜@12½ cents for Daisies.

MUSCODA, Wis., Oct. 9.—Offerings Muscoda and Lone Rock Dairy Board of Trade: 700 twins; market active; all sold, 11½ cents.

SHEBOYGAN FALLS, Oct. 4—Cheese—Seventeen factories offered 1,359 boxes of cheese on the call board today, and all except 35 cases Young Americas and 200 Daisies were sold as follows: 260 cases Young Americas, at 12¼c; 285 at 12½c; 35 at 12c; 65 Twins at 12c; 71 at 11⅞c, 395 Daisies at 12c. Market active and firm.

MANITOWOC, Oct. 4—Cheese—Offers of cheese at the dairy board of trade, today, were 850 boxes Daisies, 160 boxes Twins, 725 boxes Young Americas. All Daisies and Twins sold at 11½c; 325 Young Americas at 11½c, 400 at 11¾c.

BRILLION, Wis., Sept. 29—The sales of cheese were 1,800 Daisies at 10¾c; 895 Flats at 10¾c; 450 Young Americas at 11c; 130 Young Americas at 11¼c.

PLYMOUTH, Wis., Oct. 3—Sales to-day 1,370 Twins at 11⅝c and 1,250 Americas at 11¾c. Market strong.

NEW YORK, Oct. 9.—Butter—Creamery, Western, extras, 24c; firsts, 22@23c; state extras, 23½@24c; firsts, 22@23c.

Cheese—State, full cream, small colored, fancy, 12¼@12½c; white, 12@12¼c; large colored, 12c; white, 11¾c.

Eggs—State, Pennsylvania and Western, 20@22c.

CANTON, N. Y., Oct., 2—There were 1,900 boxes of cheese and 800 tubs of butter registered; no butter was sold. Sales of cheese were reported at 11¼c.

FULTON, N. Y. Oct. 2—To-day 18 factories were represented with 1,040 boxes of cheese. Large sold at 11c and small at 11¼c.

OGDENSBURG, N. Y., Oct. 2—There were 849 boxes of cheese offered here Saturday. On the board 11c bid with no sales. On the street 11¼c was bid, but no factoryman would accept this price.

NORWICH, N. Y., Oct. 2—The sales of cheese here Saturday were: Small colored creams, 450 boxes at 11c, and 600 at 11½c; small white creams, 190 boxes, at 11½c; small colored skims, 300 boxes, at 9c, and 600 at 9¾c. The butter market was firm with dairy at 20c and creamery at 22c.

WATERTOWN, N. Y., Oct. 2—The sales of cheese were: Large colored, 1,285 boxes at 11@11¼c, and 320 boxes at 11⅜c@11½c; Twins, 400 at 11¼@11½c; small singles, 100 at 11½c Twin sage, 100 boxes at 12½c. The bulk of ths sales was at 11¼c.

UTICA, N. Y., Oct. 1—The cheese market was very strong and the ruling price for all grades was ½c higher, 4,411 of the 8,456 boxes selling for 11½c as against sales of 6,699 boxes of the 8,329 at 11c last week. The transactions were over 2,400 larger than at the corresponding date last year.

The transactions on Oct. 4, 1897, were 8,495 boxes with the ruling 8⅝c for large and 9c for small. The transactions on Oct. 3, 1898, were 6,020 boxes with the ruling 8c for large and 8⅝c for small.

The butter market to-day was active and the sales were unusually large as follows: 40 packages at 22¼c; 12 packages at 22½c; 27 packages at 23c; 140 packages at 23½c and 17 cases of prints at 25c.

LITTLE FALLS, N. Y., Oct. 2—The market made an upward move to-day, prices being firm at ½c advance over those of last week. While this was hardly expected there appear good reasons for it. Sales here one year ago were 6,453 boxes of cheese, while to-day they amount to only 4,418 boxes. Nearly all these cheese sold to-day at 11½c, only a few lots going at 11c.

CINCINNATI, O., Oct. 9—Butter—Firm; 24½c. Cheese—Firm; good to prime Ohio flat, 12c. Eggs—Firm, higher; 15c.

BOSTON, Oct. 9—Butter—Creamery extra, 24c; western extra, 23c; dairy extra, 22c; imitation creamery, 16@17c; western ladle, 15½c; print creamery, 25½c; box creamery, 24c.

Eggs—Fancy, near by, 26@28c; choice fresh, 21@22c; Michigan, extra, 20c; western, 19c; fair to good, 17c.

NEW ORLEANS, La., Oct. 9—Extra creameries, 24@25c; ladles unchanged.

Cheese—Firm, active. Cream, 13c; skims, 7@9c.

Eggs—Fresh, 18c; storage, 16c.

WASHINGTON, D. C., Oct. 9—Market firm. Extras, 24½c; firsts, 23c.

NEWARK, N. J., Oct. 9—Market firm; 24c for extra Elgin only. Receipts fair.

PHILADELPHIA, Pa., Oct. 9—Butter—Solid packed separator creamery, extra, 24c; creamery, firsts, 23c: seconds, 19@22c; imitation creamery extra, 18c; firsts, 16c; seconds, 14c; ladle-packed, extra, 16c; firsts, 15c; seconds, 14c. Print Butter—Creamery, extra, 24c; firsts, 23c; seconds, 19@20c.

Eggs—Pennsylvania and near by, 19c; Western, 19c; Southwestern, 18c; Southern, 17c.

BALTIMORE, Md., Oct. 9—Butter—Market firm; creamery sepatator, extra, 25@26c; extra firsts, 24c; creamery firsts, 23c; creamery imitation, extra, 19@20c; ladle, extra, 17@18c; Western store packed, 13½@14c; creamery rolls (21-lbs), 24@25c; creamery prints (½-lb), 25@27c.

Eggs—Market firm. Quote strictly fresh stock 17c, as to quality.

ST. LOUIS, Mo., Oct. 9—Butter—steady; creamery, 19@24c; dairy, 14@19c.

Eggs—Steady; 14c.

KANSAS CITY, Mo., Oct. 9—Butter—Creamery, 19@22c; dairy, 16c.

Eggs—Fresh, 14c.

Latest quotations for fancy creamery, Buffalo, 24c; St. Paul, 22½c; Minneapolis, 22½c; Detroit, 24c.

NEW YORK MARKET.

NEW YORK, Oct. 7.—Cheese—Receipts for the week, 39,789 packages. Exports for the week, 7,271 packages. Our market is about the same as last week: sales in the interior of the state were relatively higher than here and most of the trading was of a speculative nature. Exporters are buying some large cheese at 12 cents and probably 12¾ cents for some favorite marks. Some sizes sold to jobbers and retailers at 12 to 12½ cents. Market is closing strong at the close. We quote: Full cream, small, extra, 12½@12¾c; medium, 12@12¼; poor, 9@11c. Full cream, large, extra, 12@12¼c; medium, 11½@11¾; poor, 9@11c. Part skimmed, extra, 10½@11c; medium, 9@10c; poor, 7@8c. Skimmed cheese, poor, 5@6c.

Butter—Receipts for the week, 32,633 packages. Exports for the week, 2,327 packages. There was good healthy trading in all grades of butter and the demand came from all quarters. Fancy fresh creamery was quick taken at 24c with barely enough arriving to go round.

Fine September and October make dairies sold on arrival at 22c and poor to good tubs found buyers at 16 to 20 cents. Fresh ladle goods were less active but receivers are firm and demand full prices. Fine June creameries sold in line at 22c, and under qualities at 20 to 21c. Market closes with light stocks and holders firm. We quote:

Creameries, fresh, extra, 24c; medium, 22@23c; poor, 18@21c. Creameries, June, extra, 22@22½c; medium, 20@21c; poor, 18@19c. Dairies, extra, 22@22½c; medium, 20@21c; poor, 15@18c. Ladle, extra, 16½@17c; medium, 15½@16c; poor, 14@15c.

Eggs—Receipts for the week, 53,580 cases.

Strictly fresh stock selling quick and wanted. Ice house eggs slow and irregular in prices. We quote:

New York and Pennsylvania, finest, per dozen, 21@22c. Western and Northern, finest, per dozen, 20@20½c. Ice house and ordinary marks, per dozen, 16@18c. DAVID W. LEWIS & Co.

177 Chambers St.

BALTIMORE MARKET.

BALTIMORE, Oct. 5—Butter—The majority of the creameries contributing to the receipts in this market of separator butter direct from points of production, have shown a material shrinkage in the quantity of their outputs, so great indeed in a few instances, as to be alarming, but for the quieting fact that the demand has shrunk in the same proportions because of the advanced prices. The business in extras of this variety is almost, if not quite, limited to the distribution of regular weekly receipts of well known and favorite makes, which in turn go into immediate consumption by the classes who are not compelled to resort to lower grades or different varieties as soon as the best gets above their limit. The receipts of gathered cream goods have continued light, with no improvement in grading, but have met with prompt sales because of the conditions above recited and the natural demand. Imitation creameries are in very light receipt and are in great request. Ladle packed butter is also in light receipt and eagerly sought after. June butter has some inquiry, but the transactions have not been heavy the past week, which fact is chargeable to higher figures being asked. There are a few lots of rolls arriving, and the receipts of store packed are very light. Rolls are in active demand, and for the high grades the cutters would pay more than our highest quotations.

Creamery Separator, extras, 24c; firsts, 22½@23c; seconds 20@21c. Creamery Gathered Cream, extras, 21@22c; firsts, 19½@20c; seconds, 19c; Creamery blocks (2 lb) extras, 25½@26c; firsts, 24@25c; seconds, 22@23c; Creamery prints (½lb), extras, 25½@26c; firsts, 24@25c; seconds, 22@23c. Md., Va. & Penna prints, extras, 21c; firsts, 20c; seconds, 18@19c.

Cheese—Receipts light, demand active; market firm with advancing tendency.

N.Y. State—Cheddars, fine, 12¼@12½c; choice 11¾@12c; fair, 10¾@11½c. Flats, fine, 12½@13¾c; choice, 12@12¼c; fair, 11½@12c; Small, fine, 13¾@13½c; choice, 12½@13c; fair, 12@12½c. Ohio—Flats, fine, 12¾@12½c; choice, 11½@12c; fair, 10½@11c. Ohio—Picnic, fine, 12½@13c; choice, 12@12¼c; fair, 11¼@11¾c. Swiss Cheese, fine, 12@12½c: choice, 11½@11¾c; fair, 10½@11c.

Eggs—The receipts of choice fresh eggs continue light, and for this kind there is a quick demand, and for a lot of fancy eggs our quotations could be exceeded; market firm on all good to choice eggs. Owing to the great scarcity of fresh eggs, a great many dealers have had to draw on their cold storage stock to bridge over. All choice marks meet with prompt sale.

Western Md. and Penna. per. doz. 17½c; Eastern Shore (Md. and Va.) per doz. 17c. Virginia, per doz. 17c; Western & W. Va., 17c; Cold Storage per doz. 16@16½c: Southern per. doz. 16c.

301 Exchange Place. G. M. LAMB & BRO.

LIVERPOOL, Oct. 9—Butter—Finest United States, 98s; good, 73s.

Cheese—American finest white, 54s 6d; American finest colored, 56s.

WANTED—AGENTS FOR CREAM SEPARATORS

During the next six months—in conjunction with the introduction of the improved "NEW CENTURY" De Laval Cream Separators—we shall thoroughly reorganize our system of Dairy or "Baby" separator local agencies. Out of 2,000 existing agencies and sub-agencies 1,500 will be changed, and as many additional new ones created. 1900 promises to be the greatest of separator years. Centrifugal separation and clarification must soon become universal. Machines may be sold in every township. The conceded superiority of the "Alpha" De Laval machines should give them 85 per cent. of the total trade. But live aggressive agents are equally essential to getting it. We have the machines and require more good agents. Successful separator agents are confined to no particular class. Applications should give full details.

Mention This Paper In Writing.

All Reading Notices under this head are at the rate of 25 cents per line.

For Sale—Three fine Guernsey bull calves, by SEBASTIAN HELLER, Calumetville, Wis. 35-tf

Wanted—A car-load of good milch cows, any breed except Holsteins. Must be fresh or springers. Address, FALICON, Clarksville, Mo.

Wanted—A working manager for a small 20 cow private dairy farm. Knowledge of butter making and general farming required. An active energetic man wanted. ARLINGTON DAIRY, Bangor, Mich.

Married man would like position on dairy farm. Experienced butter maker. References given if desired. Address BOX 375, Plainview, Neb., stating wages.

Wanted—A position by a first-class butter maker and creamery manager. Ten years experience. Best of references. Address Box 492, S haron, Wis.

Wanted—Good reliable man to work in a creamery as second hand. Man with some experience is preferred. Address HIGHLAND CREAMERY CO., Kenwood, Wis.

Wanted—at once. Good milker and all round dairyman at CEDAR HILL JERSEY FARM, Monmouth, Ill.

A situation is wanted by a butter and cheese maker of twelve years' experience. A 1 references as to character and capability. For further information address W. W. BURGETT, Long Point, Ill. 34-2

Experienced buttermaker (Danish), 33 years old, wants position in a creamery or on a dairy farm. Four years' experience in the old country and at present buttermaker at Eagle Valley Creamery, Edwards, Colo. Can take care of stock. For particulars address, MARIMIS FRANDSEER, Edwards, Eagle Co., Colo. 34-2

Wanted—A dairyman who would like to come south to take charge of a first-class dairy. Address "E," Glenraven P. O., Tenn. 34-3

A Baby De Laval Separator No. 3, capacity 600 lbs. an hour, 30-gal. churn, butter worker, 6-bottle Babcock tester, shafting, pulleys, belts, etc. Price $100.00. Separator good as new and cost $200.00. E. R. BALSLEY, Troy, Wal. Co., Wis. 34-tf

Wanted—Practical farmer and dairyman to rent good farm in Southern Minnesota. Also good single man to work on stock farm. Must understand care of stock. Address "H," care HOARD'S DAIRYMAN. 33-3

Wanted—Experienced butter and cheese maker. One that thoroughly understands his business. References required. State wages expected. Address, D. HART, Del Rio, Val Verde Co., Texas. 33-3

Herdsman wanted who is a good feeder and milker, and wants steady employment. For particulars address A. J. DAUGHERITY, Streator, Ill. 32-tf

Prosperity is here.—Anyone who doubts it can be convinced by visiting any of the towns in western Iowa or Minnesota on the new lines of the Chicago & North-Western Railway. People in the immediate vicinity of these towns are quick to see the advantage and are already in advance of the railroad, building stores, residences, elevators, lumber offices, etc., etc., but there is room for more. The country is splendid, and will in all cases amply support all lines of business and trade and in the most of the towns the best locations are still open. Lots in any of these towns cannot help but be safe and paying investments, as they are still on the market at the original low prices. For particulars address, J. F. Cleveland, Land Commissioner, Chicago & North-Western Railway, Company, Chicago. 34-2

Half Rates to Portland, Ore., Seattle and Tacoma, Wash., Via the North-Western Line. Excursion tickets will be sold at one fare for round trip from all stations, October 12 to 15, inclusive, limited to November 16, 1899, account of W. C. T. U. Convention at Seattle. Variable routes, delightful scenery. Apply to agents Chicago & North-Western R'y. 34-2

A DECREASED BUTTER PRODUCT IN MINNESOTA.

The Minnesota Dairy and Food Commission have been investigating the output of butter in that state and report that in their estimation it will be considerably less than last year. In the opinion of the department this is due to the higher prices of grain and beef cattle.

"Farmers are too readily induced to part with cows that are fit for beef."

This fact, no doubt, will lessen the butter product of the state, but the farmers will make more profit after all, if they get rid of all cows that go into beef condition while milking. It is time the farmers saw this point and looked at the question from the standpoint of profit per cow rather than the gross product for the year. As we have often said before, prices would be good for butter or cheese if the cows that made either at a dead loss to their owners, were eliminated from the producing field.

It is the butter that is made at a loss that weighs down the market.

MILK POISONING.

A dirty, unthinking dairyman, who neglected to properly clean his milk cans, produced a serious case of tyrotoxicon poisoning in Knoxville, Tenn., recently. Had the man been as well posted in what pertains to his business, as a man ought to be who is handling milk and the health of customers as well, he would not have brought fear and trembling on all milk consumers in that vicinity. Secretary Coile, of the Knoxville Board of Health, puts the case in the following clear light:

"A great many dairymen do not seem to realize, either through ignorance or not wishing to abide by simple sanitary laws in guarding the health of their customers, that it is absolutely necessary for milk cans to be properly cleaned once each day, and better, each and every time they are used, if it is more than once per day. The cans should not only be rinsed in hot water, but should be boiled. It is absolutely essential that the cans should be cared for in this manner. If they are not, the sediment breeds bacteria and fermentation commences, which results in the poison, just as it did in the case now on hand. Tyrotoxicon is the same poison which is sometimes found in ice cream."

In every instance, this bacterial poison, called tyrotoxicon, is caused by filthy ways of caring for the milk and milk utensils.

The Drouth and Its Lessons.

Alfalfa and Silage.

ED. HOARD'S DAIRYMAN:—The present year of pinching drouth, such as few farmers have ever seen, has done what it can to teach us a lesson, and one that will be worth all it has cost us, if we will but learn it and practice these teachings. The great difficulty with all sorts of people is that they do not observe closely, and if some of them do they fail to make the application.

Let us begin with alfalfa. It is a new crop with us. Most of our farmers do not know it when they see it, and most of them are slow to make a trial of anything new in the crop line, unless an example of its value were thrust into their faces. Sometimes they would not do it then. So there is a call for some preaching.

There is, for instance, a small patch of alfalfa on a farm in western New York, that ought to serve as an object lesson to the entire neighborhood. It is located on one of four corners of a much traveled road, about mid-way between two prosperous villages. All summer long it has been a conspicuous feature of the landscape, for it was green and growing, while literally everything else in the forage line was standing still, or had turned brown and disappeared. The alfalfa was such a refreshing sight in the midst of all its gloomy surroundings, that it was worth a trip to look at it, though it was a small patch, and was more or less hampered by shade trees.

I have some curiosity to learn how the farmer came to sow that plot, but am so well satisfied that it has come somehow from the fact that two members of his family are engaged in professional experiment work in crop raising that I have asked no questions.

Now for some possible results. In spite of the fact that this small piece of ground was about the only one for a wide district that has been at all independent of the dry weather, and has produced a good crop of forage, I am convinced that there will not be any considerable amount of alfalfa sowed in that district, either next year or right away. It is so hard to get such things started. Someone has heard that this sort of clover does not catch as readily as red clover, and someone else hears that it is often slow to produce a full crop, so there is plenty of excuse for letting it alone, and an excuse is quite enough to furnish a reason for not making any sort of new departure in agriculture.

And so the cows go all summer with just enough feed to keep them alive. It has often seemed to be impossible for them to do even that this summer, yet special forage crops are not adopted any more than as if the grass was sure to grow knee high in the pastures every summer. It is a fact that corn is not a certain crop in very dry seasons. I have seen too much of it withered up or standing a foot or two high this summer, unable to grow any further, not to know that. What, then are we to do in dry spells? They will come practically every summer, and though they do not always last for months as the one this summer did, they are sufficient to reduce the flow of milk materially, and then it is hard to bring it up again. Mill feed is very high and scarce, and the silo is not common yet.

Still there is hope that there will be some advantage taken of the situation made so painfully apparent this summer. I hope to see the farmer, especially in regions like this, where land is good and easily cultivated, adopt the plan of partial soiling of his dairy. If the season turns wet the land set aside for pasturage may be enough to furnish feed in plenty, but there will be no safety from poor or dried up pastures, till plans are laid at the outset looking to the probability of need of either silage or green forage for the cows outside of pasturage. If this is not done the old plan will stick to us as it always has done, and the result will still be that the cows will produce little more than half the butter that they should.

With the late advances in the price of cheese, butter and meat, the problem of producing them in quantity is fairly thrust upon us, east as well as west.

Erie Co., N. Y. JOHN CHAMBERLIN.

Judging Guernseys at the Wisconsin State Fair.

Mr. Philips' Answer to John Jones.

ED. HOARD'S DAIRYMAN:—Two articles in your issue of October 6th attracted my special attention, and as I am a party concerned in one of them, I ask space to reply.

I refer first, because I read it first, to the very sensible article on Judging Dairy Cattle, taken from the Canadian paper, *Farming*. I will quote only the last sentence, as it applies to my case in particular. Speaking of fitting animals, it says: "It may tend to shut out all but the professional exhibitor, and make it difficult for a farmer to exhibit even if he has a good animal." That is the exact tendency of milk injecting, bagged udders, greased ears, shaved tails and cows kept inside and blanketed with heavy blankets, while the farmer's cow is in the pasture.

The second article on the same subject, which refers to my cows, though does not mention names, is signed John Jones. That is such a common name that it is hard to locate him.

He was astonished, so he writes, at what he heard the Ohio breeder say; so am I at the statement he makes after examining the cows. He says, the third premium cow (which was old Queen Vashti) he found as stated by the Ohian, with only two perfect teats. Now the truth is I have owned her seven years and much of the time milked her with my own hands and during that time she never had a diseased or imperfect teat and I begin to doubt Jones' judgment. That cow gave twenty-four pounds of 5.8% milk the day before she started for the fair this fall and, as she is due to freshen again December 21st next, is nearly dry now. Did he expect her to be bagged down like another cow in barn B, that the man in charge said had been left for three milkings. I invite any man who believes Jones' yarn to come to my barn and examine both these cows, and I'll meet him at the train and take him there.

Now a word for the first premium cow, Queen of Salem. She has neither an enlarged nor an extinct teat. She came in June 1st on dry feed and it required constant care for forty-eight hours to ward off milk fever. I was with her most of the time night and day, her udder was very large and inflamed and when danger was over and fever left her she gave only about half as much milk out of one front teat as she did out of the others. This never occurred before and we are milking that teat the best we can, for she is a valuable cow and I expect and have the assurance of an old Scotch neighbor that when she comes in again it will be all right. I saw Prof. Carlisle examine it carefully and I believe he judged her conscientiously. Ever since she came in, until she started for the Fair this fall, the tally sheet in the barn shows that she gave from thirty-two to thirty-eight pounds of 5.4% milk, often at night going twenty pounds.

Now without any reflection on Mr. Jones' judgement I wish to call his attention to three facts concerning my cows. First, they were not kept up and blanketed a day the past summer; they run in the pasture Thursday, and Friday were put in the car for St. Paul; they were fed well every day but were not curried nor brushed until they went to the Fair.

Second, my cows were milked as clean night and morning for the four weeks we were out as they are at home.

Third, not one of these cows is for sale.

Can he say the same of the cows he is trying to brace up?

I could say more but will not do it now as what I have said is to simply exonerate the judge from any intended unfairness in the matter.

Not until I knew that Mr Wood, of Mankato, and Prof. Carlisle, of Madison, were to be judges at the Minnesota and Wisconsin fairs, did I consent to exhibit, as I have unbounded confidence in the ability and honesty of both. You can't fool either with big udders swollen with milk that should have been extracted twenty-four hours before. In their judgment the dairy points of the cows, not their unnatural appearances, won the ribbons, and I can truly say I hope the time is near at hand in the line of dairy reform when any man who either himself or by another injects milk into udders, lets cows go without or beyond the regular time of milking, greases or shaves their ears or tails or does any thing to modify or change the normal appearance of his animals, shall be barred from competing in the show ring.

The dairy cow is a machine, and her value, in the estimation of a good judge, is the capacity and ability she has for doing every day business. That's the standard, Mr Jones, we are after.

I will now close, but really I would like a personal letter from Mr. Jones, giving his P. O. address. A. J. PHILIPS.

West Salem, Wis.

Velvet Bean and Beggar Weed.

The temporary destruction of the orange groves, and the introduction of the two invaluable legumes, velvet beans and desmodium (beggarweed,) have changed the order of things. Florida is now really richer in leguminous, soil-enriching crops than the north; she has velvet beans, cow peas and desmodium with the prospect of a winter legume, the vetch, being presently added to the list, so covering all the year.

The velvet bean was known for years as an ornamental, but it is only within the last four or five years that it has come forward as a soil renovator and stock feed. It is a vine; if supported it will grow thirty feet high, but it is usually allowed to run along the ground. On a good soil it will cover the ground with a solid mat of vines six or eight inches deep. It produces large, rich beans, more bushels per acre than corn, twenty-five or thirty bushels being no uncommon yield. They are occasionally slightly sickening to some men, also to a few horses, but this distasteful element will, doubtless, be bred out of them by cultivation. They are very fattening to cattle and hogs. Thousands of acres were planted last spring in South Florida, and nearly all by men who had first experimented, in a small way, and satisfied themselves of the great value of this crop. Many machines have been tried for threshing them, hitherto with only indifferent success; but an inventor in Orange county seems to have devised a satisfactory threshing machine, a two-horse and a four-horse power, and he is, at the present time crowded with orders ahead of his capacity to make them. The cultivation of upland rice has also received a strong impetus in south Florida, and in a few years we shall probably see combined rice and bean threshers travelling about the country.

A good many bean hullers were manufactured at first, the pods being picked by hand; but the pods are so tightly adhesive, that it has been found best to grind them up unshelled. They make the richest feed for cattle, swine and milch cows. I should not be surprised if 30,000 acres of velvet beans are planted in the state next year. In the spring there is such a mass of vegetable matter on the ground that it is a serious task to plow it under, even after it has been cut up with the disk harrow. In a few years, under this course of velvet beans, light sandy land becomes dark colored with humus, and will produce thirty or thirty-five bushels of corn per acre without other fertilizer.

Desmodium is also a leguminous plant, and is often called Florida clover. It yields no grain, but can be cut for hay twice a year, occasionally three times, yielding two tons per acre, which, when properly cured, is as fragrant and as freely eaten by live stock, as red clover hay in the North. The seed needs to be sown thick, in order to reduce

the stalks (they will grow seven feet high if standing sparse on good land,) and the crop should be cut green.

We do not deny the poverty of most Florida soils, but here is the point: These legumes, with the help of a slight sprinkling of potash and phosphate, will produce two-thirds as much value in grain feed (beans) per acre as the average northern soil, and more forage, and then a manure crop. This yearly manure crop keeps up the land. Desmodium is self seeding. Velvet beans have to be planted every year, unless left on the ground, beans and all; and they are too valuable for that. An old farmer of the cotton belt, told me he had, for years in succession, raised twenty, twenty-five and thirty bushels of corn per acre, on thin, sandy land, with no fertilizer but desmodium. This comes up after the corn is "snapped," and soon covers the corn stalks out of sight, hiding the cows and horses; and on this rich feed, live stock soon becomes fat and sleek. The small beans falling to the ground in winter, support hundreds of quail.—S. POWERS in *Country Gentleman*.

How to Take Milk Samples.

Vermont Agricultural Experiment Station

(Press Bulletin)

In the interest of Vermont dairymen attention should be called again to the necessity of proper precautions in taking milk or cream samples for analysis. It is a common thing for Vermont creamery patrons, dissatisfied with the test of the milk they deliver, to send a sample to the Experiment Station in order to compare its results with those given out by the creamery. The idea is a good one, but its execution is often faulty. Few people realize how easy it is to take an incorrect milk sample. There is good reason, moreover, to believe that more than one-half of the many hundreds of milk samples sent by farmers every year to the Station are improperly taken and that the results of the tests are misleading. The Station can do no more than test what is sent. By no art of legerdemain can it arrive at a correct test from an incorrect sample. No doubt many creamery managements have been unjustly accused of carelessness, incompetency or worse by patrons who have based their judgment upon the Experiment Station tests, when, as a matter of fact, the trouble lay in the faulty samples furnished to the Station by the complainants.

While mistakes are readily made in this matter, it is not difficult to take a proper sample, if the directions here given be followed. The samples, at least, will not be at fault.

Creamery testing may be best checked, either by halving the creamery sample or duplicating it. When the creamery composite sample is complete and ready for testing, the operator may be asked to furnish one-half of it. The patron should then be certain that the operator thoroughly mixes the sample by pouring; that all the cream from the sides or the jar, covers, etc., is mixed into the milk or cream, and that the halving is done immediately after the last pouring. In lieu of this, the operator may be required, every time he samples at the factory, to furnish a duplicate sample, in a jar controlled by the patron. In this way duplicate composite samples may be made, one held in the control of the operator, and the other in that of the patron; both of which should test closely alike.

If samples be sent to the Experiment Station, Burlington, Vt., for its free analysis, they should be carefully taken. Wide-mouthed jars should be used, which should be filled absolutely full to prevent churning in transit. Express charges should be prepaid, and the name of the party sending should be placed upon the package.

Notes from Tennessee.

Building and Filling a Silo.—Abortion Suspected.—Oleomargarine a Jackall.

ED. HOARD'S DAIRYMAN:—Am very much pleased with the DAIRYMAN. Received some cards from you some time ago; have been very busy and have not used them yet, but think I will.

Have built me a silo and filled it "most full." Put all the corn I had into it. Thought four acres would fill it, but eleven, of fifty bushels to the acre, didn't do it. Somebody in your paper said that a fellow never got one large enough. I thought possibly he was right, he spoke so authoritatively, before I tried it, but I've not got so much confidence in his assertion now.

Mine is fourteen feet in the clear and twenty-four feet deep, and while I don't believe it would hold all the corn made in the county, it still lacks a fourth of being full. I made it of green lumber and had my hoops tight at the start, but had to wait a couple of weeks for my cutter, and the hot sun made them loose; I tightened again, but they were more or less loose when I filled it, and while they tightened up for a while, I am afraid are not tight enough. I think there will be a good deal of loss. My corn was a little over-ripe I expect, though I put in no dry stalks, nor cut it below any dry blades.

But I wanted to ask you about my cows. I am sure I have got that abortion disease among them, and I have got some young heifers that I surely want to save. I have been suspecting it for one or two years, but I feel sure of it now. There would be no good, so far as I can see, of my trying to tell you why I think so.

Sometime ago I saw somewhere a digest of the experiment station of Iowa in which they spoke at length concerning the symptoms and cure and disinfectants.

I thought at the time I'd take special care of it but have lost it, and would write to the Station for a copy, but have forgotten where it is. Could you help me in this without too much trouble? Of course I see those patent remedies advertised in the DAIRYMAN, but I never could do a ny good with such. I guess it's ignorance on my part but that don't remedy the trouble any. I also see one man's experience in disinfecting and thought I would use it in connection with the station exegesis.

Yes, I think you are right in your position in regard to oleomargarine. Let her get out from under our cloak. Pull out those peafowl feathers and being a jackall, parade as a jackall. She has already, cuckoo like, been hatched and nourished at honest folks' expense. Will she never be able to carry her own load? REUBEN C. BURDETTE.

Utility of Records.

[A Paper by CHAS. L. HILL, Rosendale, before the Wisconsin Dairymen's Association, 1899.]

While a few breeders of pure bred dairy cattle have realized the importance of, and have undertaken the keeping of, accurate milk and butter records of their herds, there are very few dairymen who are doing it. The breeder who does not do it, will soon be the exception, as every year more of the dairymen, who are looking for pure bred bulls for use in their herds, wish and ask to know something about dam's milk and butter records; and the breeder who wishes to sell his young bulls in competition with his brother breeders must be able to answer their questions carefully and intelligently.

In years gone by a seven-day butter record was quite generally accepted as the best means at hand to show a cow's value as a producer, but anyone keeping both weekly and yearly records will soon place little value on the weekly tests. I hope you will pardon me, if in this paper I draw for facts quite largely from my own record books.

To show the small value of a weekly record I will give you a few figures: In 1893 and '94 I tested several cows for seven days. Coral made in seven days sixteen pounds of butter, and at the end of the year the books show she had made 430.7 pounds. Primrose made only thirteen pounds in seven days, but made 460 pounds in the year. Mernalette made in seven days eighteen pounds, ten ounces, and her best yearly record was not over 350 pounds, while Snowflake, making thirteen and one-fourth pounds while fresh, made 473 pounds in a year, and Prestoun that never made over twelve pounds, made 441 pounds in the year. Plenty of other records could be quoted, showing the same variation.

From these figures you will readily see that any breeder or dairyman, who wishes to know the individual value of the cows in his herd *must* keep *yearly* records. The breeder who keeps such records is the only one who can breed intelligently. Not long ago I saw the pedigree of a young bull whose dam was a 550-pound cow. The second dam was a 482-pound cow, and the third dame was a 495 pound cow, while the sire's dam was a 608-pound cow, and I certainly believe that it is from sires of this and similar breeding that the best cows of the future are to be bred.

It is only by keeping yearly records that the dairyman and breeder can weed out his poor cows intelligently. He will find that all of his young stock finds much more ready sale if their dams have good yearly records.

If you stop to consider, you will see that if it is important for the breeder to keep records, it is doubly so for the dairyman who keeps only grade cows, for the produce of the pure bred herd annually brings in quite a sum, while the other has only the milk and its products to depend on and so more surely loses if he keeps a poor cow.

In talking with dairymen and urging them to keep yearly records, one will almost come to think that many of them believe that, "In ignorance is bliss." The most common excuse is that it takes too much time. I am sure with scales and record sheet in a convenient place, the weighing of the milk will not take over five minutes per day extra time for each twenty cows, but even allowing eight minutes per day, it would take five days' time of ten hours each, for a year's weighing. If any dairyman will weigh for a year, and then say it hasn't paid him, I should like to go and work for him the five days and see what he and his cows are like.

While for the ordinary dairyman, weighing once a week, or even once or twice a month, will answer the purpose of showing approximately the year's work, there is another very important reason for daily weighings, and it is the keeping track of milkers and the effects of change of care, feed, etc.

One man who weighed all his milk for a year, said it was worth $25 per year to him, and when his man did the weighing it was worth $50.

I find my men every milking talking about one and another cow being up or down in her milk, and it soon puts any man on his mettle to keep his cows up to the highest possible production.

I have here for inspection a sample of the record sheet we use now. They were ruled to order at a cost of two cents each in lots of 300. A sheet of foolscap similarly ruled will answer every purpose at a cost of one-half of a cent. For scales we use a regular milk scale that retails for $5. This scale reads zero with the pail on, and therefore shows the net weight of the milk. A 25-cent spring balance will do the work, but the weight of the pail must be deducted each time.

(NOTE.—The sheet exhibited by Mr. Hill was 17×28 inches, was ruled as indicated in the sample columns below, and contained spaces for keeping the records of 36 cows, being two columns deep and eighteen columns wide. The secretary has inserted dates and titles to the subdivision columns, which are left blank in the original.)

Milk record for month of.....189.....

At the end of each month the total weight of each cow's milk is copied into a book kept for the purpose. About the middle of each month take a composite sample of four to eight milkings from each cow's milk. Test it with the Babcock test and copy the result in the same book. The pounds of milk produced in a month multiplied by the per cent of fat, as shown by the test of that month, will give that cow's production of fat for that month. The sum of these months' production of fat with one-sixth added, will show the annual production of butter. With this done you are ready to commence your weeding.

However, if you have a cow that you feel sure is not doing as well as usual, try her one more year; or if she is a new comer to the herd, give her two years' trial before condemning her. Now will come the question of what you shall require each cow to do before discharging her. For the breeder I think the day has surely arrived when no mature, pure-bred cow is worthy of a place in a herd, that will not make 300 pounds in a year; or if a heifer with first calf, 180 to 200 pounds. If poorer cows are given a place, no male calves should be raised from them. From the standpoint of the man who expects to breed up a herd, I would not buy a bull from a cow that would not make or promise to make 350 pounds.

For the dairyman, I am not prepared to fix a standard. I think, over the state, the average net price paid farmers for butter at the creamery, for the past year or two, would not be over 14 or 15 cents. A cow making 200 pounds might barely pay for her feed. As the average Wisconsin cow makes not more than 150 to 160 pounds of butter it would seem as if it would have been better if they had never been born.

I used to doubt the accuracy of such state averages until two years ago I heard a man say, who lives only two miles from me, that he thought he would keep track of his cow receipts for a year. He had eleven cows and heifers in milk. They freshened from March to May. He made a little store butter before the cheese factory opened and a little more in the fall before the cows froze up. His total receipts were $88 and a few odd cents for the year. I must confess that here was a man who would probably have derived no benefit from individual cow records.

Don't let another year go by without knowing just what each cow in the herd is doing for you.

DISCUSSION.

Prof. Henry: How many minutes a day do you think it would take to weigh the milk of ten cows and record the weight, Mr. Hill?

Mr. Hill: As I said in my paper, I figured that out for twenty cows, and the men did not know that I was looking at my watch, and I found it would take only five minutes extra time per day. I allowed eight minutes, to be sure, and I found that it figured out altogether five days' work in the year for a herd of twenty cows.

A Member: What breed of cattle do you

Two Wagons at One Price.

It is a matter of great convenience and a saving of labor for a farmer to have a low, handy wagon. They save more than half the labor of loading in hauling manure, hay, grain, corn fodder, wood, stones, etc. The man who already has a wagon may have one of these low handy wagons at the small additional cost for a set of wheels. These Electric Steel wheels, with either direct or stagger spokes, with broad faced tire, are made to fit any axle. You can convert your old wagon into a low handy wagon in a few moments time. You thus virtually have two wagons at one price. Write to the Electric Wheel Co., Box 130 Quincy, Illinois, for their catalogue; which fully explains about these and their Electric Handy Wagons, Electric Feed Cookers, etc.

ALBION JERSEY HERD is headed by
Pedro's Prince Phillis 42298,
An **Ideal Dairy Sire,** carrying 75% of the blood of **PEDRO 3187.**
R. C. GREEN, Albion, Wis.

High per cent ST. LAMBERTS and TORMENTORS,
Oct. 25th and 26th, at Pomeroy, Ohio.
Have sold my lands and must sell my cattle. Send for catalogue.
J. P. BRADBURY. Pomeroy, Ohio

consider the best for dairying and butter making particularly?

Mr. Hill: I would rather be excused from answering that question.

A Member: Another question that arises among our dairymen, a good deal, is: Will the cow that tests three per cent milk make as much cheese as the cow that tests four per cent milk?

Prof. Henry: There is an exhibition over in the cheese room which answers that question and tells us that they get more cheese and the dealers will tell us that it is better cheese, from the richer milk up to 4 per cent.

Mr. Hodgson: I think that idea of weighing the milk is profitable in a great many different ways. I think the point with reference to hired men is very valuable. I have followed the business for about twelve years, and the greatest trouble has been, to get the last strippings from the cow, and if they are not thoroughly milked, the best is left, and, consequently, we are the losers. It is the few last strokes that we want; the rest is pretty much consumed in expenses. I have practiced weighing the milk. I do not make butter, nor do I take my products to a creamery. I make cream and send it to Milwaukee. I have a tank on my separator, which weighs eighty pounds with the milk. I take the full can, which holds thirty pounds to the bottom of the glass, and each man that puts in this can, full to the glass, has a tally by the side of the separator, so that every day I know the weight of my milk, and about every week I want to find out how the individual cows are going, so I weigh the milk of the individual cows. I take about a tablespoonful once a week out of each cow's milk for testing, then I find out the average test of my milk. I take forty pounds of milk, perhaps, and if that forty pounds makes 23% cream, that is all right; if it runs more, I turn a little screw in the separator, and make it a little lighter; by so doing I have an even grade of cream. I used to have trouble with the cream occasionally running a little light, or a little heavy, though that didn't happen very often. I find this an important point to a man making cream for shipment, and that it pays to test the cream, and keep it running even.

Secretary Burchard: There were so many points in this paper, that it is impossible to to do them all justice, but there was one which I consider very important, and that was where he showed that a cow which never had been considered a phenomenal cow, never made a great record for a week or a day, or, perhaps for a month, had, in the long run for the year come out ahead. Now, I know from my own experience with my own cows, and I know from observation among my neighbors, that the tendency, all the time, is for us to judge of a cow by the very best performance that she is able to make at any time during the year; when we succeed in getting a cow to give a pailful and a half of milk, and a pound and a half, or two pounds of butter, we gauge our value from that one single thing, whereas, this other cow, which never gives a wonderful mess, and never makes a large amount of butter, and of which we say: "She is a very ordinary cow," will in the long run do the best for us. Now, a cow has a right to be judged by what she can do, not for a day, but from day to day for a year, and there is no other way given under heaven, whereby you can find that out, except by keeping the record right along. Give her credit to-day only for what she does to day, and this week and next week, and next month, and every month for twelve months do the same and then foot it up, and we will find the old fable that we read years ago, of the race between the mud turtle and the rabbit affirmed. The rabbit distanced the mud turtle, of course, in the beginning, but the turtle kept plodding along and got to the goal first, and it is so with many a cow.

Mr. James Smith: I would like to ask what is the cost of a Babcock tester?

The Chairman: They cost all the way from $4 up. A very good one can be bought for $5, and you can pay as much more as you please, according to the size and style of the machine. If you want to be very economical, you can get one for $3 or $3.50 that will test about two bottles, that is, make two tests at a time. The five dollar machine will give you four bottles and some make them for five dollars that contain six or eight bottles. It is a small investment and the best investment that I know of and the greatest benefit derived from it of anything in the way of an invention along dairy lines. No man can afford to run a herd of dairy cows without a Babcock test in the family.

Secretary Burchard: The utility and the value of the Babcock test has been spoken about, but it has not been said that this Babcock test has been given, not only to the people of Wisconsin, but to the people of the world, by the Wisconsin College of Agriculture and Experiment Station, and I undertake to say here and now that the benefits conferred by the Babcock test upon the people of Wisconsin are far, very far, in excess of the cost of the entire Agricultural Department of the State University; that it has proven a profitable investment if they could not show anything else; and when you people hear, as you will hear everywhere, a little bit of criticism; "Well, that is costing a good deal, isn't it? We have paid so many thousands of dollars for that Agricultural Department," just remember that no good thing ever comes without cost. I remember that Dr. Holland says something to the effect that when you undertake to get something without paying for it you generally get cheated.

Now, when you hear these criticisms, just point to this one thing, and that is not all by any means. We will show you here another thing that has come from the Wisconsin Experiment Station, the Wisconsin curd test, and we will have it exemplified before you, whereby any man can take samples of milk and can tell you to a nicety whether they are fit for making cheese or not. But just bring it right down to this one item of the Babcock test, and it can be clearly demonstrated that it has been of more value to the people of Wisconsin than the entire cost of the Agricultural Department of the University.

The Chairman: Your president seconds the motion. That is all right. There is lots of this sound philosphy, you know, that never gets out so people can see it in its true light. I am glad these facts are going on record. This last year the college at Madison, the Dairy Department, gave to this Association two expert cheese makers and we sent them out to give instructions in making cheese, and largely through their efforts a great uniformity in the make of cheese is seen and the record shows that it is bringing about a cent a pound more on the market, and that means about $60,000 more to the state. Canada cheese is bringing a better price than ours, but we are going to try and make better cheese than Canada and get two cents a pound more than we have and make it $120,000. That is one of the positive things in our experience as dairymen that we want to work for and reach.

Prof. Henry: Very nice things have been said here of the Agricultural College by the secretary of this Association. To show how far back things reach and where the roots go to, I want to say that the Wisconsin Dairy School is the outgrowth of the Wisconsin Dairymen's Association. It is that Association that pushed the Agricultural College, with Hiram Smith on the Board of Regents, and it was Hiram Smith on the Board of Regents, backed up by the Wisconsin Dairymen's Association, who said, "We must have a dairy school." It was Charles R. Beach who stood up and said, "That building must be put up this fall," and it was about fourteen weeks after that that the school was practically built and we had one hundred pupils; and every year since then we have turned away pupils. I am asking now that the building be enlarged and I want you to back me up and help that good work along.

The Chairman: I think I can pledge the faithfulness of this Association to hold up the arms of the director while the battle rages at Madison. Don't let them go, Professor; they will give it to you, because we all want it.

Farm Accounts.—Information Wanted.

ED. HOARD'S DAIRYMAN:—I have some 300 acres of farming lands in the state of New York, and would like some of your patrons to give a form and system of keeping farm books or accounts, something simple yet accurate, so that at the end of the year, it can be seen at a glance, just what has been received from all sources, and how the money has been expended, and the different items, as dairy, pork, hens, etc., kept so that it can be seen what each produced and what the cost of production has been, so that it can be seen which is the most profitable. No doubt many of your patrons would be willing to give their form or system, some of which might be of much use to others.

Brooklyn, N. Y. C. D. RUST.

I Can Sell Your Farm no matter where located. Send description and selling price, and learn my successful plan. W. M. OSTRANDER, 1215 Filbert St, Phila., Pa.

Cow Hopple

MEADOW LAWN HERD Holstein-Friesians.
Herd headed by **Sir Brookside De Kol.** Choice young stock for sale. Come and see them. C. W. HARRISON, Ringwood, McHenry Co., Ill.

OAK GROVE HERD H-F. Cattle.
Cows, Heifers and Bull Calves For Sale.
C. H. Stevens, Jefferson, Wis.

High Test I offer the grand young bull Prince Mercedes DeKol, whose 4 nearest tested relatives have an average equivalent record of 24½ lbs. and 4.14% fat, and have won 1st, 2d, and two 3d prizes in H.-F. Offic'l Prize Contests. Others extra good. MALCOLM H. GARDNER, Darien, Wis.

HOLSTEIN-FRIESIAN CATTLE
Owned by **JONES & RANDALL, Hustisford, Wis.** 100 head to select from. From families rich in butter fat. Herd now headed by Barron Paulina De Kol. Stock for sale. Prices reasonable.

HOME FARM HERD.
Headed by Jewel of Home Farm, Sweepstakes Holstein-Friesian Bull Trans-Mississippi Exposition Omaha, Neb. Seventy-five head to select from. **W. B. BARNEY & CO., Hampton, Iowa.**

DE KOL 2nd
Is the world's four-year-old, and greatest officially tested butter cow in Holstein history. Her record at four years old is 33 lbs. 6 oz. butter in 7 days; at 11 years, 26 lbs. 9 oz. in 7 days, official test. De Kol 2d won the Register Butter Cup, valued at $200. Valley Mead Farm is in a position to give the blood of this unrivaled butter cow, through her greatest and only son in the west, called De Kol 2d's Alban. His daughter holds the world's official test for one day in America, viz., 4.83 lbs. FOR SALE—Young bulls, grand sons of De Kol 2d. Valley Mead Farm, Monticello, Wis

Markham Manor Farms. Simonsville P. O., Andover, Vt.
Holstein-Friesian cattle bred from the most fashionable butter families, individually large producers, and of the most approved show form. The herd contains seven daughters of Sir Netherland Soldene Clothilde, No. 18390, H. F. H. B., the most remarkable show bull of recent years. Also large English Berkshire Swine from noted prize winning and imported stock. Write for description and prices to **J. A. THORNTON,** Mgr., **Simonsville, Vt.**

ELGIN BELLE.
With the largest daily butter record in the advance registry. Viz: 4 lbs. 10oz., and 31 lbs. 9½ oz in seven days, 100 lbs, 6 oz in 30 days, is another of these famous dairy cows which have been gathered together at Valley Mead Farm. The performance of Elgin Belle for milk and butter both for two years in succession, stands unapproached in the history of dairy cows. Her yield of milk in two years, of over 40,000 lbs., and making the above phenominal tests, will justify the statement. Hoard's Dairyman says: "Elgin Belle is an excellent cow, with few equals and still fewer superiors. Her conformation clearly indicates this." Elgin Belle and two daughters are breeding. **Valley Mead Farm, Monticello, Wis.**

The Best Investment
For you this summer may be a fresh supply of . .
BUHL Tinned Steel Milk Cans.
They do not leak, break or rust, and keep the milk cool and sweet.

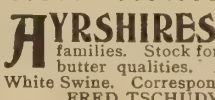
Belle Korndyke.....official test 25.77 lbs.
Helena Burke.....official test 25.45 lbs.
We want to sell 40 cows and heifers and 20 young bulls, bred in the lines above mentioned. Write stating exactly what you want.
HENRY STEVENS & SONS, Lacona, N. Y.

GUERNSEYS FOR SALE. The increase of my herd is a few young things of both sexes, from one to eighteen months old. Prices corresponding to age and quality. **F. W. TRATT, Whitewater, Wis.**

Riverside Guernseys, CHAMPION Herd
AT NEW YORK STATE FAIR,
1898, in competition with the leading herds of the country, won eight firsts and sweepstakes. Young stock by **COMUS,** sire of most of the winners, for sale. Thoroughbred Poultry—the best egg-producing and general purpose varieties—Leghorns, Wyandotts, Buff Ply. Rocks, Houdans. Send for circular. Stock for sale. **J. FORSYTH,**
Riverside Farm, **Owego, Tioga Co., N. Y.**

GUERNSEY CATTLE
The Old Homestead Herd has more than duplicated its record of last year, at the Ohio, Ind. and Ill. State Fairs again in 1899, winning not only over two-thirds, but three-fourths of all prize money offered on Guernseys at the above fairs. This herd was not defeated at Wis., as might be your impression from the report of awards, but was withdrawn in the third ring, yearling bulls, on account of what I regarded as an unfair combination on the part of Wisconsin's Judge, Ass't Superintendent and an exhibitor. The Assistant Sup't of Dairy cattle being an exhibitor in his own department, contrary to the Society's printed rules, and receiving on his yearling bull an unmerited award from a judge who was his intimate friend. L. V. AXTELL, Perry, Ohio.



ROSENDALE GUERNSEYS
Our herd has won first prize at the Wisconsin State Fair every year since 1894, and also won first at Minnesota State Fair and at the Trans-Mississippi Exposition in 1898. We keep only 400-lb. cows. Tuberculin tested.
GEO. C. HILL & SON, Rosendale, Wis.

"Florham" Guernseys.
First Prize Herd wherever shown, viz: New York State Fair, 1895 and 1897; Bay State Fair, 1895; Inter-State Fair, Trenton, N. J., 1895 and 1897; Madison Square Garden, 1895; New Jersey State Fair, 1897. **J. L. HOPE,**
Farm Supt., Madison, N. J.

GUERNSEYS!
84 Cows averaged 399 lbs. of Butter each in 1898. . .
Some Choice Young Stock For Sale.
ELLERSLIE STOCK FARM,
Rhinecliff, N. Y.

AYRSHIRES Finely Bred and from the very best families. Stock for sale, bred for milk and butter qualities. Also fine herd Chester White Swine. Correspondence solicited.

HAND SEPARATOR DEVELOPMENT.

An Australian Expert Answers Some of the Objections to its More General Use.

Writing to the Australian *Farm and Dairy* upon the subject of private separator development, L. A. McIntyre answers some of the common complaints against the hand separator on the farm, and seeks to show how the troubles which stand in the way of its more general use may be removed.

Mr. McIntyre says that "the payment for cream according to quality is the only sound and honest way to promote the best interests of the dairy farmer, and the more fully it is recognized the more completely will our farmers be educated to understand that without their intelligent co-operation it is impossible to raise the quality of our butter product to that standard of perfection necessary to complete successfully with other nations. This co-operation is not only required where the farmer supplies cream from a private separator, but also where he supplies milk to a skimming station.

"The principal grounds of complaint against private separators have been: First, that a portion of the cream from them has been over-ripe when delivered at the factory, and, secondly, that there is a wide difference in the density of the cream; but each of these faults are remediable, and where they exist are attributable to either a want of knowledge, carelessness, or an absence of cleanliness on the part of the farmer.

"To ensure a sweet cream it is imperative that cleanliness should be strictly observed from the time the milk is drawn from the cow until the cream is delivered at the factory. All animal or vegetable decompositions productive of foul odors, should be removed from proximity to the milking shed and dairy, all vessels and utensils used in connection with the milk and cream thoroughly scalded and rinsed, the cows' teats and udders carefully cleaned before milking, the dairy or separator house kept scrupulously clean, well ventilated, and with the floor so constructed that splashes of milk cannot remain in crevices and thus produce taints.

"Some substances are subject to much more rapid decay than others, and few more liable to early deterioration than milk or cream, especially if it comes in contact with air containing the germs of fermentation. It has been proved that the ferments conveyed to cream in this way are fungi of one kind or another, which have been thrown off by some animal, from vegetable decomposition, or produced by cesspools or manure heaps. At temperatures which suit their propagation these ferments multiply very rapidly, and bring about early destruction, especially in substances rich in nitrogen, such as milk or cream. Cream will also quickly absorb any taint that may be in the air, whether putrefactive or not, and the butter made from it will be more or less injured.

"A common error with private separator owners is to mix the cream at varying degrees of temperature, running the warm cream from one milking direct into the can or vessel containing that from the previous milking. In most instances the cream is extracted immediately after milking, and contains a certain degree of animal heat. It is most important that this heat should be removed as soon as possible, to effect which it should be run over a cooler, or, in the absence of this operation, the can or vessel containing the cream should be placed in a cask or tank of cool water above the height of the cream, and kept at an even temperature until taken for delivery to the factory.

"The second objection raised to cream from private separators, viz., variation in density, is one that affords an easy remedy, especially where it is being sent to any up-to-date factory, which is fitted with vats for cooling and blending. It is generally agreed that cream skimmed so that it will produce from thirty-five to fifty per cent of butter is capable of being churned into a first-class butter, and it should be an easy matter for our factory managers to educate the farmer to regulate his separator to produce a cream between the two above mentioned degrees of density. A few farmers will persist for reasons which, if obvious; are not very sensible—in running their cream very thin; but, if they only considered the loss they were sustaining through the unnecessary quantity of milk left in it, they would effect an alteration. This milk would be worth about one farthing per gallon for feed to calves or pigs. My experience is that the great majority of farmers are anxious to carry out the instructions of factory managers as to the thickness at which cream should be run, and if the managers fail to instruct them the fault is more theirs than the farmer's.

"An opinion has been expressed by some dairy people that the general introduction of pasteurization will kill the private separator, but I am disposed to think such an opinion somewhat premature, as it has been proved that private separator cream can be pasteurized with most satisfactory results, providing it is in a proper condition for being thus treated. In pasteurizing either milk or cream successfully, it is necessary that each should be perfectly sweet. The general application of the system of pasteurization will bring about a compulsory reform both in the delivery of milk and cream that will be generally beneficial.

"In outlying districts, where there may be a number of private separators, a central pasteurizing plant could be placed to which the cream could be taken, and thus the cost of conveying it to the factory would be minimized."

That Cowy Odor.

It is frequently remarked by those who are questioned about their fondness for milk that they do not like it because it has such a cowy odor. Some seem to think this odor is inseparably connected with milk, but this is not the case. The cause of it will be found in filth dropped from the animal's udder and flanks while milking, in nine cases out of ten.

One great fault with the way some people handle milk lies in the carelessness of the milker. For them to brush or in any way clean a cow's udder before sitting down to milk would be considered altogether too much trouble.

"It will all come out when it is strained," they say, and strip away regardless of falling hairs, scruf, or particles of dirt and filth loosened from the flanks in the operation of drawing the milk.

Here is a solution to the cowy flavor which some milk possesses. As a remedy, brush the udder and flanks well before beginning to milk, passing over them a moist cloth or sponge to arrest any loose particles liable to fall after sitting down to the animal. It is best to prevent foreign substances from getting into the milk at all, but it is better if they do get in to remove them as soon as possible rather than let them remain.

"I can't bear to drink the milk we buy," said a lady one day, "there is so much dirt in the bottom of the dish when I pour it out."

There is no excuse for such a condition of things—not the slighest. If the men are not as careful as they should be, all the more is there a necessity for carefulness in straining it. Any woman who contents herself with a wire gauze strainer, no matter how fine it may be, is allowing a great deal of filth to go into the pans or milk cans. It is impossible to avoid this unless a cloth strainer is employed. Of course no one would knowingly be careless in this respect, but it is through thoughtlessness that it is done.

If it is believed that the wire strainer is sufficient, just try three or four thickness of cheese cloth secured to the bottom of the strainer with a hoop or ring. After a pailful of milk has been strained, remove and inspect it. Flannel makes a perfect strainer so far as thorough work goes, but it fulls in the washing and sometimes the milk does not pass through freely.

Where the milk is set in deep cans the strainer usually furnished with them has a tin band or hoop to hold the cloth strainer in place over the bottom. But whatever method may be resorted to, see to it that the milk passes through several thickness of cloth after it has been put through the wire gauze strainer.

These strainer clothes are difficult to keep sweet in hot weather. They are best first rinsed in cold water, then thoroughly washed in that which is luke warm, or a little more, without soap. Borax is a good cleansing agent; so also is salsoda, but beware of soap. It makes any kind of milk things slimy, such is its action upon any thing which has not been thoroughly freed from all trace of milk. Scald the cloth at last and snap it vigorously to free the meshes entirely from any particles which may be lodged therein. Hang in the sunshine to dry whenever possible.

Bleached butter cloth or cheese cloth costs but six cents per yard, so do not try to use a strainer very long, but cut a fresh one Any-

Wells Richardson & Co.'s Improved Butter Color

THE BEST IS ALWAYS CHEAPEST

"THE KIND THAT HAS NO MUD"

can always be relied upon as the BEST, being UNIFORM, free from all SEDIMENT, and NEVER becomes RANCID. It is for sale by All First-class Dealers.

Harmless As a Big Red Apple.

Everybody wants and has a right to insist upon pure food. Not only that which is free from adulterants, but especially that which is free from poisonous compounds. Some states have pure food laws which are directed at adulterants. New York has gone them one better and enacted a Butter Color Law, which is directed at the poisonous compounds now being sold as butter color.

Thatcher's Orange Butter Color

is as harmless as an apple. It is composed of perfectly pure and healthful vegetable substances. The highest authority in the United States, Prof. H. W. WILEY, Chemist of the Agricultural Department at Washington, says it is **a harmless preparation of Annatto having high coloring power.** Remember that coal tar and analine dyes are rank poisons and should never be used in coloring butter. Use only Thatcher's and preserve and increase the reputation of your butter, Remember every drop of Thatcher's Orange Butter Color adds to the weight of butter and is guaranteed as represented.

thing used about milk must be kept perfectly sweet.

And by the way, this is a good time to speak about the care of the wire gauze strainers. How few there are that are kept perfectly clean. After they have been used a while they begin to get clogged.

Shall I tell you how this comes? One cause is pouring hot water over the strainer without first washing it with cold. The hot water cooks the milk and leaves the meshes of the wire clogged as a result. Be sure to rinse with cold water first every time.

If the milk things are not washed immediately after using, rinse them at least, not allowing the milk to dry on them.

If a stiff brush is used in washing, every tiny bit of foreign matter can be removed from the wire. Never put the strainer away until it is perfectly clean, and all the meshes distinctly visible when held to the light.

A yellow deposit is sometimes seen upon the surface of milk pails, strainers, etc. This is caused by washing in hot water before rinsing in that which is cool, The hot water cooks the milk the same as it does in the wire gauze of the strainer, thus forming the deposit noted. When this is visible it is difficult of removal. Perhaps dry salt is as good as anything to use. Scrub vigorously with this; it is an excellent cleansing agent anyway.

Any one can not be too careful in caring for milk things. Utmost cleanliness must be observed in every particular, if best results are to be expected.—*Northwest Pacific Farmer.*

Some Good Thoughts For the Dairymen to Think.

Geo. E. Newell, in the *American Cultivator*, puts several things together in a clear, terse manner as follows:

A good dairy region exists where there are good dairymen.

Well-fed cows do not have to show up pedigree to establish a milk record.

There is more money for the average dairyman in keeping his pasture fences in repair than in looking after political fences.

Talking about farm wages, how much does the average dairyman's wife usually receive?

A "practical dairyman" is one who makes a profit out of his cows.

If your cows shrink in milk yield during stormy weather it shows that you have not given them sufficient protection from the elements.

A cow, like a man, is known by the company she keeps. Don't let her get poor by allowing sheep to eat the grass from under her nose.

You cannot perpetuate good meadows and let cows graze on the rowen.

The maker who uses his or her finger for a thermometer, was never yet known to produce regular supplies of good butter or cheese.

There are other and better ways of encouraging a cow to give down her milk besides kicking her in the ribs.

The most nutritious grass grows on the best-prepared soil.

The man with a well-defined silo usually takes precedence when it comes to a profitable farm and neat, substantial buildings.

The hardest cow to milk is usually left to the hired man.

Carelessness and sour milk go hand in hand.

Greasy, soiled clothing marks a poor buttermaker.

Every year is a good dairy season for some. Why is it not so for all?

The dairyman with the longest head is apt to carry the longest pocket-book.

I never yet saw a profitable cow that was not docile and gentle, and in order to be such she had to have a docile and gentle owner.

A man does not necessarily have to become gray in acquiring the right sort of dairy experience. Some of the best dairymen I have ever seen were vigorous, alert, progressive young men.

How Oleo Displaces Butter.

Few people are aware of the great profit that the oleomargarine manufactures reap, or the competition the farmer must contend with. We take as a basis that there were 87,800,000 pounds of oleomargarine manufactured in the United States last year.

The average amount of butter produced by each cow in the United States is about 200 pounds a year. The amount of oleomargarine displaces 4,309,000 cows, worth at $30 apiece, $12,927,000. This will give some idea of the great loss to the farmers of the United States.

But now let us take the product and make a comparison between the loss of butter and the cost of oleomargarine, and see what a large profit goes into the hands of the manufacturers and dealers in imitation butter. The average wholesale price of oleomargarine is 10 cents per pound. The average price of butter throughout the year is 20 cents per pound. This shows the difference between the average price of these products of 10 cents per pound, but we will add 2 cents to the cost of selling the oleomargarine. This will leave a profit of 8 cents a pound on the 87,800,000, or a net profit to the dealer of $7,024,000 a year.

In looking at the cost of oleomargarine to the manufacturer we find that oleomargarine is composed of lard and tallow, which sells at 5 and 3 cents respectively, or an average of 4 cents a pound for the manufacture of oleomargarine. But we will be liberal to the manufacturer, adding 2 cents a pound to the same for the product when manufactured, which he sells for 10 cents, leaving him a gain of 4 cents a pound; and on 87,800,000 pounds the manufacturer makes the snug sum of $3,512,00. Added to this the $7,024,000 which the retailer makes we find that the oleomargarine business in the United States for one year has brought into the coffers of those engaged in the business the sum of $10,536,000.

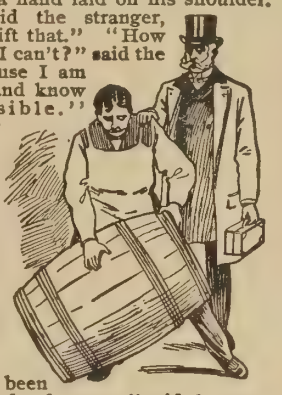
From all the data that can be gathered, butter cannot be produced for less than 17 cents a pound during the year. The argument of people in favor of oleomargarine is that it is as good as butter. If it is, why do they not sell it for oleomargarine, and not butter? You will find all the dealers in this product throughout the United States want their oleomargarine colored and put up the same as butter. You cannot find one of them advertising oleomargarine for sale. Their place of business is always known as a butter store, using the words "Pure Dairy Butter."—*Grocery World.*

Testing Purity of Ice.

I am not an "expert" butter maker and I do not feel qualified to dispute Mr. Leighton's views on ripening cream. In fact, I entirely agree with him that impure ice is probably the cause of more bad flavor in butter than any other one cause. Ice should never be put in the cream if, when it is let stand in a cup or dipper until it is melted, the water is not good to drink. One cannot judge of its purity by allowing a piece to melt in the mouth, for the cold dulls the sense of taste so that the bad flavor is not noticed. But the result upon the flavor of the butter will be the same as if the dirty water the ice was cut from, was poured into the cream vat. I think also that if ice is used in the cream at all, it should be broken fine, not larger than walnuts, and the cream stirred frequently if not continuously, till the ice is melted.

Now, boys, I want to hit where someone's head probably is. How many of you have a little microbe breeding cesspool or trap in the creamery? Don't snap out "I haven't," and get mad, but listen. Have you a closed up step built on the floor—that is, floored up underneath? Have you a box of some kind to set your milk scale on or in, where you don't scrub regularly? Is there a knot hole in the floor that lets the slop through to rot and fester on the ground underneath? Are you sure your drain is running freely, and that there is no slop or filth standing around the top of the well and slowly filtering through the curbing into the well? If you are careless, letting any of these things go unattended, you don't deserve to be called a butter maker.

You can make your work a great deal easier and do it more thoroughly if you will devote a little time occasionally to making things handier in the creamery. You live there most of your waking hours, so why not fix everything as handy as possible? Don't let a thing go on in a state that it makes you feel like cussing, if you don't actually do so, every time you use it, just because you can get along tomorrow yet with it. If you intend to hold down your job it is not just tomorrow but months and perhaps years to put up with it. A little work and ingenuity will change the cause of trouble into a source of satisfaction and a saving of labor as well. A little thing like pulling out those unsightly nails in the wall that you don't use and putting them where you have use for them; fixing up a little shelf over the wash sink to put your soap, extra brushes, etc., on, and putting a shelf or table on the left end of your wash sink takes but little time, and will pay for itself every day you work.



Of course, you are tired when you have to get up at four or five o'clock in the morning and work till afternoon as hard as you can jump, but if you will try to make everything as handy as possible you will be surprised how much easier your work will become, and others will notice that you are, unconsciously perhaps, doing your work more thoroughly. You will have, perhaps, a few minutes more time and you will wipe up that greasy engine and take up those loose bearings that you have been too busy to attend to. Soon you will be interested in your creamery and will stop thinking about how long it is till pay day. Then you will be on the road to success.—JEROME PFLAUM, in *Chicago Produce.*

SEPARATOR CREAM FOR ICE CREAM

We often hear complaints from ice cream manufacturers that they cannot use separator cream successfully for their product. The following from Mr. Harry Boswell, of the Sun set creamery, in Portland, Maine, may prove valuable as giving a few hints for the proper management of such cream for the making of ice cream:

"The milk is taken the first thing, and run through an aerator and the temperature reduced to 40° F., which takes out all the animal heat," he continued, "and then placed in aerated cans and taken to our skimming stations, where it is heated to 70°, prior to being run through the separator. When the cream arrives in Portland, it is again chilled to 40° F., which absolutely purifies it of any impurities which might, by chance, have escaped the separator. You see, we run our separator a thousand revolutions higher than usual, which is an effectual purifier. The next step is to put the cream into the ripening vat, where it is prepared for use in ice cream. This is but a mere outline of our method of handling the ice cream branch of our business.

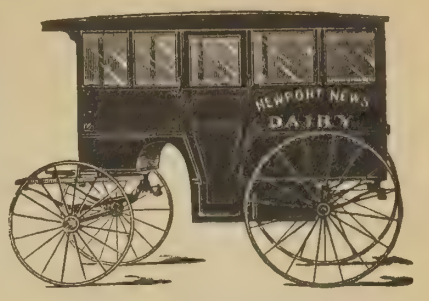
A man just in the act of lifting a barrel of flour felt a hand laid on his shoulder. "Stop!" said the stranger, "You can't lift that." "How do you know I can't?" said the man. "Because I am a physician, and know it's impossible." "That may be," said the man, "but I know I can," and he stooped and lifted the barrel to his shoulder. "What made you so sure you could do it?" asked the astonished physician. "Because I've been doing it every day for years," said the man.

There are physicians who say in good faith to those whose lungs are worn by disease "It is impossible to help you." And yet thousands of these impossibles have been helped and healed by Dr. R. V. Pierce whose "Golden Medical Discovery" has cured them, when the hollow cheek, the rasping cough, the burning flush, and night-sweats have all pointed to consumption.

Ninety-eight out of every hundred such impossible cases can be cured says Dr. Pierce. What makes him so sure? Because he has been curing just such cases for more than thirty years. "Golden Medical Discovery" is strength to the stomach, life to the lungs, nourishment to the nerves. It makes new blood and the new blood builds a new body—a fit temple of health.

There is nothing just as good as "Golden Medical Discovery," so let no one deceive you into accepting a substitute.

"I beg to state that I have used three bottles of Dr. Pierce's Golden Medical Discovery since my correspondence with you and find great improvement in my case," writes Mr. A. F. Novotny, of New York, N. Y., (Box 1437). "I feel that I am in need of no more medical assistance. When I started to take your medicine I had a regular consumptive cough, of which I was afraid, and every body cautioned and warned me concerning it. I was losing weight rapidly, was very pale and had no appetite whatever. Now my condition is changed entirely. I do not cough at all, have gained eight pounds in weight, have recovered my healthy color, and my appetite is enormous. I can recommend your medicine, as it is a sure cure, no humbug, as are most other patent medicines."



Dr. Pierce's Pellets cure biliousness.

Concerning That Last Fall's Symposium.

ED. HOARD'S DAIRYMAN:—Last winter, while attending the institute, I interviewed a few dairymen, in connection with the work I was doing, having that list of questions you formulated and sent out, in view. It was impossible to obtain trustworthy and satisfactory answers to all the questions, but enough were obtained, I think, to be of some value to the DAIRYMAN'S family of readers. The matter is such, although somewhat late in appearing, owing to its being mislaid, that it is just as good now as when the interviews were had.

NUMBER ONE.

Hon. D. P. Witter, Richford, Tioga County:—Average number of c ws in the dairy in 1897, fourteen, all of which were heifers, none above four years old, and one-half but two years. Milk went to a creamery. Receipts $50 per cow. The other accounts have not all been properly kept. The cows are grade Jersey and grade Holsteins. The estimated cost of keep was $28 to $30 per cow.

I have no use for dual or all-purpose cows. Mine are special-purpose, which is m lk. My Holsteins have been graded up to nearly full blood. I have not bred from any of the bulls you mention, for milk purposes, so have no records from such.

The constitution of my herd has not been weakened in the least, by breeding. I have never lost "a hoof" of any kind. Not more than five out of fifty heifers will fail to make two-hundred-pound a butter or better, in a year; many of them made good per cents above those figures. I have cows from which I sold $100 worth of milk each, at the creamery, in a year. The average of the herd is seven thousand pounds of milk.

The average butter fat is not far from 3.5%. One heifer four years old, averaged 55½ pounds of milk dai'y in January. I milked one cow till she was thirteen years old. She was giving 11,000 pounds per year.

I have an octagon silo of 100 tons capacity. I use Sibley's Pride of the North corn. Have never fed summer silage. My cows go dry August 1st, and are due to freshen in September and October. I begin feeding silage November 1st, and continue to May 10th to 15th. If I run a summer dairy I would certainly feed summer silage. Wheat bran, gluten and some buckwheat middlings are fed to balance the ration. Never feed corn meal; there is corn enough in the silage. My yield of silage is twelve to fourteen tons per acre, put in the silo at a total cost of $1 to $1.25 per ton. This includes all labor, use of the land and the cost of the fertilizer applied. Food value of silage is two and a half tons equal to one ton of good mixed hay. The cost of putting a ton of mixed hay in my barn will average nearly $3.00; fully $2.50. I grow all the clover I can and feed it twice a day, using about eight pounds per cow. I have 142 acres in my farm.

NUMBER TWO.

H. W. Mann, West Eaton, Madison county:—My herd consists of seventeen grade Holsteins; average yield of milk 6,000 pounds per cow. Milk all shipped to New York. Heifer calves all contracted a year ahead, for raising. Average price not far from $6. Milk ranges from fifty-five cents to $1.00 per hundred pounds. I raised five heifer calves last year. Do not know what the cost of keep per head is. I feed well and liberally and receive a good profit from it, at present prices.

My cows are all special-purpose, which is milk, and are fed grain of some kind every day in the year. I used a thoroughbred Holstein bull to grade up my herd, and now have his daughters in milk. I would not, under any consideration, breed from a Red Poll, Devon, Durham or Swiss bull. Have never bred from a general-purpose bull, so have no records from such. My heifers from Ayrshire stock were not nearly so valuable as my present ones. I am a firm believer in special-purpose cows, keeping none but the best of those I raise, caring for them well and feeding them liberally.

Milk is not Babcocked in this town. I weigh each cow's milk once a month, and have made some private tests. They average about 3.4% fat. Could not give you now the earnings of my herd, but have the figures at home.

(Mr. Mann's record is necessarily incomplete, having given it to me away from home.—*Reporter.*)

NUMBER THREE.

B. C. Cook, Cazenovia, Madison County:—My farm contains one hundred and twenty-two acres, on which I kept eighteen cows last year, and eleven head of young stock. Made butter for private families, which sold for thirty-five cents per pound. There are many city people having cottages near our lake and a large number of residents who take city boarders and who want nothing but the *best* of dairy products. Receipts for butter, including that consumed on the farm, $75; including calves, $85 per cow. Estimated cost of keep not more than $40 per cow. Fed ensilage twice a day and about one ton of hay per cow. No objection was made by our patrons because we fed silage.

I aim to raise as much of the grain foods as possible. Last year I harvested one thousand one hundred bushels, and bought about one hundred dollars worth of bran. I kept twenty-nine cattle and nine horses; no sheep. I pay about five hundred dollars a year for the labor of two men.

I keep none but special-purpose cows—those for butter production. I don't want any general-purpose animals, wagons or farm implements on my place. My herd was a mixed one when I began grading it up. I had Holsteins, Durhams, Galloways and natives. I bought a thoroughbred Guernsey sire and began to grade up the herd. My first increase was spoiled when young, by over feeding, and was made too fat; but the next issue was fully 20% better than the original. I cannot give you all the figures you want, for the reason that I shifted from cheese to butter; then, too, I have no way of really knowing just what the old ones did, because the milk was pooled.

I would not breed my cows to a Red Poll, Durham, Swiss or Devon bull, but would use only full blood Jerseys or Guernseys, and would keep each family separate. One should never, in my opinion, cross the pure breeds, no matter what they are. If I were to start again, I would begin with native cows with no strong blood ties to influence the pure blood which I wished to introduce. I have never bred from any general-purpose, grade or beef sires, and would not under any circumstances. Would sell my herd and go out of the dairy business before I would do that.

My heifers are too young yet for me to estimate the per cent of the increased yield of butter, but I have some young things that are producing a pound of butter per day. As a rule, my cows are not dry more than two months of the year. My preference is to milk a cow 300 days and allow her a rest of sixty-five days. My original herd, I do not think, averaged more than 150 pounds of butter per year. I cannot tell, however, because I made cheese at that time.

NUMBER FOUR.

F. C. Overton, Belleville, Jefferson County:—My herd formerly consisted of forty-five; last year I milked thirty-three. Milk went to the Belleville factory which made both butter and cheese, and was Babcocked. The factory is run every day in the year. Receipts, including calves, $53 per cow. Cost of keep, all told, about $40 each.

I began using a thoroughbred sire in 1888. A large number of the original herd were, practically, thoroughbreds and consisted of Durhams, mainly. There were a few Ayshires, nearly full bloods. About one-half of the present herd is now thoroughbred Holsteins, having purchased an imported sire, "Mary's Charm," at the time we commenced to grade up. The stock came from the herd of Henry Stevens & Sons, Lacona, N. Y. The other half of the herd is high grade Holstein, some as high as seven-eights. We reduced the herd from forty-five to thirty-three, but are receiving as much from the latter as from the former, which is practically one-third more per individual with a less cost of keep, because we now have a silo. Our first cross was fully 20% better than the original. I would not breed to a Red Poll, Swiss, Durham or Devon sire for dairy purposes under any circumstances. Would allow the entire herd to go farrow before I would do such an act.

I do not think I had more than one good cow out of each five, when I used a general-purpose or grade sire, and, when I did get one, I believed she owed it all to her mother.

I have not kept a record of performance of my heifers, but think that 75 to 80% of them will mature into cows, making more than 200 pounds of butter each in a year. My original herd did not give more than 3,500 pounds of milk each. The present one gives nearly 5,000 pounds which will produce fully 250 pounds of butter. The value of skim milk and whey from the dairy, last year, and which was fed to pigs and calves, was not less than $5 per cow.

There are twenty of the herd that drop their calves in late fall and early winter so that, practically, we have sweet, new separator milk eight and a half months of the year. Cheese is made during about three and a half months, and I do not consider the whey item of much account. If sweet, and it be mixed with ground grain, it is worth to me about five cents per hundred pounds to feed to calves.

No matter how good one's cows are, there will be more or less of them each year that must be, for various reasons, disposed of; but good cows are always in good demand, while poor ones go at a discount. As an illustration of this, I will say that I sold, one fall, when fodder was scarce and high in price and cows plentiful and cheap, three cows for $110. The same day a near neighbor sold six out of his herd for $96.

NUMBER FIVE.

C. M. Overton, Belleville:—My herd consists of twenty cows. Milk goes into both butter and cheese, being made up at the Belleville factory. The receipts last year, including calf, were $42 each. Cost of keep $30, and I consider the manure worth fully the cost of caring for the herd. The herd is Holstein, therefore, special-purpose, dairy cows. I have not estimated cost of labor, nor kept full record of it. Our herd was graded up by using a thoroughbred Holstein sire. I would not use a grade, general-purpose or Swiss, Devon, Red Poll or Durham bull. Years ago I used grade and beef type sires, but do not believe that one in ten of the heifers ever made good cows; but I do not believe my Holsteins are quite up to the Durhams in constitutional vigor. The original herd was grade Durhams and natives.

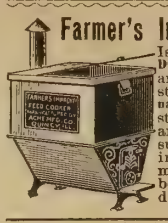
I began grading up my herd in 1890. The cows gave an average of 3,000 pounds each. The present flow is 5,000 pounds, and I am keeping the same number as then, but at less cost, for the reason that I have a silo. My cows are good milkers and are paying a good profit, but I have received more from the sale of milch cows from the herd, in proportion, than for cheese and butter, when average cows were at a much lower price, and I would not entertain for a moment, the thought of going back to the old stock. Last year I received $480 more from eighteen cows than I could have got from common ones. If I were going to change the breed of my herd, I would buy a Jersey. I do not think, however, that the proportional increase in the weight of my calves, over that of the former herd, is much, if any. I raise all of my heifer calves, and have during the last ten years.

I now have fourteen thoroughbred cows, so raise but few grades. Those are from my best grade cows, and which have all the appearances of making good heifers at three years, the age at which they are sold.

The increase in production from my first cross was about 10%, and fully 20% from the second one. The figures are from 3,000 to 5,000 pounds of milk in three crosses.

DR. SMEAD'S OLD COW AGAIN.

In answer to my letter asking for further information concerning his famous old cow



SAVE FEED.

Feed is fuel to the animal economy. It is burned up to supply internal heat. If it is heated (cooked) before it goes into the animal's stomach it saves that much fuel (feed).

Electric Feed Cookers

save feed, save money and produce better results. Made of best cast iron with steel linings; boiler made of extra heavy galvanized steel. Capacity 25 to 100 gallons. Circular and price free.

Electric Wheel Co., Box 130, Quincy, Ill.

Farmer's Improved FEED COOKER

Is superior to all others in Safety, Durability and Cheapness of cost and operation. Scientifically constructed. Heavy cast iron lining in furnace. Boiler of heavy galvanized steel. Stands high from the floor and can be put up in the barn or summer kitchen with safety. Made in 3 sizes. Every one guaranteed or money refunded. For descriptive book and prices send 2c stamp. Address, ACME MFG. CO., Quincy, Ill.

and her first daughter, Dr. Smead writes: "The old cow is a cross breed, her mother being pure Ayrshire and her sire pure Jersey. In the year, 1896-1897, between calvings, she raised a veal calf, which sold at the age of six weeks for $13, besides producing nearly 7,000 pounds of milk during the year, ranging in butter fat from 4.8% to 5.6%. You can figure yourself, the amount of butter it ought to have made.

In 1897, at my request, my hired man, who is the owner of the old cow's first daughter and which is now over sixteen years old, and three-fourths Ayrshire, kept an account of the butter sold—not made—from her. He has a wife and a son, the latter man grown, in the family. This cow furnished a veal calf, which sold for $10, at four weeks of age; all the milk, cream and butter they needed in the family, and they sold 195½ pounds. Of course, I do not consider this return a phenomenal one, but very fair, especially when we come to consider the age of the cow, nearly fifteen years from the time of dropping her first calf."

Belleville, N. Y. C. W. JENNINGS.

THE SECRET OF DENMARKS SUCCESS..

Professor Marshall of the Michigan Agricultural College, has just returned from a three months' visit to Denmark. He says, after alluding to the high reputation which Danish butter has in England, "the high quality of Denmark's butter is dependent upon:

1. Cleanliness in milking, and in all butter making operations.
2. Pasteurization of the cream, which is, at the present time, practically universal.
3. The rational use of starters.
4. Careful supervision of feeds for milch cows.
5. The adoption of scientific practices in the creameries.
6. The stimulus offered by their butter shows.
7. The favorable location of the country.
8. The absolute control of export trade."

Commenting on this, the *American Cultivator* says:

"That last item we think, is of no small importance, and if the butter and cheese sent from this country, had all been inspected, and the imitations, and ladle packed butter, and filled cheese had been prohibited from exportation, and only the best grades sent out, our dairy products would nowhave a good reputation, fairly won on their merits."

CONCERNING OUR ADVERTISERS.

THE ONLY WAY TO TREAT BLACK-LEG IS TO PREVENT IT.

Black-Leg, known by the various names of Symptomatic Anthrax, Quarter Evil, Black Quarter, etc., is one of the most prevalent and fatal diseases among cattle. Owing to the concentration of the cattle industry, large numbers being herded together, the occurrence of the disease becomes a serious matter, calling for prompt measures.

Black-Leg is a disease caused by germs which multiply rapidly and are very infectious. These germs get into the animal through scratches or wounds in the skin, or through its food or drink. The spores (or seed) of these germs are very hardy. They will live in the dry state for months and possibly years, and can easily be carried from one farm or ranch to another, clinging to the skin or feet of the animals, and so scatter the infection. It is quite possible that the germs are also carried by the water, and so distributed from one ranch or farm to others. They also exist in the soil where an animal that has died of Black-Leg has been buried.

The symptoms of Black-Leg are well known to most cattle raisers. As a rule there is a tumor or swelling of the tissues beneath the skin, usually on the thighs, neck or shoulders. If this tumor be rubbed with the hand, a perculiar cracking noise is heard. This is due to the gas contained the tumor. Animals dead from Black-Leg bloat very rapidly, the skin being stretched until one thinks it must burst. This production of gas is characteristic of Black-Leg.

Some fifteen years ago "Arloing," a scientist, discovered a method of vaccinating against Black-Leg. This method has been extensively used in many countries, and is much the same as vaccination in human beings against Smallpox.

Experiments are constantly being made in the extensive biological laboratories of Parke, Davis & Co., Detroit, Mich., with preventives for Black-Leg in cattle. This house, in addition to being the largest manufacturing pharmacists in the world, have also the most extensive biological laboratory in this or any other country. As it is quite necessary, in order no insure good results in vaccinating your cattle with Black-Leg vaccine to employ the fresh product, it would be a safe guard to specify the make of this well-known American house. They also test every lot on cattle, and find t reliable before a single dose is put on the market.

Park, Davis & Co., for the convenience of th cattle raising communities, have placed their Black-Leg Vaccine on sale at all leading drug stores, and they will supply you with descriptive literature with full directions how to perform the simple operation, etc., free of charge on application.

Now is the time to vaccinate your cattle. Best results are always obtained in the fall and spring of the year.

ABOUT HAY PRESSES.

There are many hay presses on the market, some very good, some just good and others not so good. There are some that cannot do good work in all kinds of material, although doing fairly well when pressing nice hay under best conditions. We call those "not so good." Again there are others which do nice work as long as their complicated mechanism does not break. They stand the work nicely until some extraordinary strain, under unlooked for conditions is too much for their "constitution" and they break, usually just when the user can least spare the time to go to town for broken part. Such are "just good." Then there are the "very good" ones: they are extremely simple, very few working parts, with not a cog or chain about them. They hardly ever, perhaps never, break. They are powerful and put the hay into small compass so that full weight can be put into an ordinary box car; and they press hay, pea vines, shavings, excelsior, or anything else and do it well. Such an one is the Bradley Double Cam All Steel Press, shown in another column of this paper, to which your attention is called.

Attention is invited to the advertisement of the well known "Steam Feed Cooker," manufactured and sold by J. K. Purinton & Co., Des Moines Ia.

VETERINARY.

Queries in this department answered by WM. HORNE, M. D. V. S., Janesville, Wis.

Cow PHYSIC—Three-fourths to 1¼ pounds Epsom Salts (according to age and size of animals) and two ounces of best ground ginger. Pour over this three pints of boiling water. When at 105° F., give gradually as one dose.

REMOVING PLACENTA.

I have been troubled a good deal by my cows retaining the placenta, and there is no veterinary within fifty miles of me, that I am aware of. Can you give such instructions that will enable any careful person to remove it.

Last year I had a cow to come in heat in the pasture where there was a cow due to calve in two or three weeks, and this cow kept jumping the one in heat, and in two or three days after, she dropped a dead calf. I have had the same thing occur again this fall.

Do you think the cause of the dead calf being dropped before the time, was the cow riding the cow in heat? M.

Florida.

ANSWER.

You ask for a difficult thing. It is like asking for information how to play the piano, etc.

I will do the best I can for you. Within six hours after calving, pare your finger nails closely, cover with *clean* lard up to above the elbows. gather the end of the placenta between the thumb and fore finger of the left hand; then with care, find the other end of the retained placenta, pulling all the while with the right hand, and move the left hand, now expanded, but holding the afterbirth. When you are as far as you can feel, you may pull with both hands steadily, and always waiting for a strain upon the part of the cow. This she always does when the hand and arm is inserted. If the mass breaks in two, pull the first half away, and then feel for the other.

Should you fail in getting the whole, give ounce doses of fluid extract of cotton root in three ounces of water up to three doses only. If any continued discharge, allow the cow to lie in a well slanting position. One dose each day.

Most unquestionably the jumping did the damage. Cows in heat ought not to run with other cows.

POISON FROM EATING FOLIAGE.

We have lost two cows within the last week, of some disease, I know not what.

The first cow taken, a Jersey five years old, was very loose in her bowels, on Thursday, Sept. 21, and fell off in milk, but otherwise showed nothing wrong. Friday morning would eat nothing and gave no milk; was a little dull. I was away all day, came home in the evening and found the cow down suffering great pain, frothing at the mouth and a very high fever. She died shortly after I saw her. She was fresh last December, and was due to calve next November. This morning we found another cow dead. Last evening she gave her usual mess of milk, ate her feed and seemed all right; this morning at day break she was cold. She frothed at the mouth the same as the other one, as we could see, but further than that we know nothing.

The first cow did not swell after death; the last one swelled very tight and bled from the rectum and vagina. The last one was not with calf, and had been milking for eight months.

Crewe, Va. W. F.

ANSWER.

When living and practicing in Mobile, Alabama, I had quite a number of similar cases to yours, from eating the foliage, as above stated, and always in the autumn, when persons were trimming the trees. The symptoms were identical. There are several poisonous shrubs, and other sorts of vegetable poisons in the south, to which the north is quite exempt. I noticed the southerners did not seem to know or care anything about them, and took no care. I have no doubt your cows were poisoned as above.

STIFFNESS IN COWS.

About five weeks ago one of my cows got very stiff all over, and gave no milk scarcely, for about two weeks. I gave her a dose or two of physic, and she got over it. Since then have had four or five others affected the same way, except their mouths and teats got sore, and seem to be harder to manage. One other has gotten well; one has gotten to where she eats well, but is still very stiff, feet sore and legs swollen; all have much fever, bowels generally in good condition; in most of them the actions are a little tight; one case was the reverse, very loose and offensive; she has gotten well. I have physicked each one as they commence to complain, and some of them had as many as four doses. DAIRYMAN.

Virginia.

ANSWER.

It is utterly impossible for me to form a proximate idea of the cause of your cows' trouble. You give good and correct symptoms of several diseases, all or any of which may be the result of several causes, colds, damp, a current of cold air, several kinds of poison, both mineral and vegetable. I have had all the symptoms from cows eating the foliage of the wild orange and the different laurels. These contain a large amount of prussic acid. The best I can do for you, is to see to the cause and remove it. Surely your veterinarian ought to know, if he be a qualified one.

TUBERCULOSIS (?)—LUMP ON JAW.

The young bull, I wrote you of, (p. 119) is in a bad way. The running at the nose and cough persisted all summer. After any slight exertion, as running or climbing a hill, he breathed hard with open mouth and a crackly sound. Still he kept in fair flesh and grew. But a week or so ago he began to grow worse. He ran more copiously at the nose. His cough became worse. He ate little, and became poor rapidly. Now he stands in the barn with hanging head, breathing with a loud sobbing or grunting sound, and evidently with pain and difficulty. He refuses food and water, his nose runs badly and from his open aud foamy mouth the saliva drips continually.

Two-year old Jersey heifer with first calf has lump under point of each jaw bone nearly as large as a fist. Seemed an enlargement of some gland. No pain. One of these becoming soft and evidently full of matter, has been lanced, and discharged much matter. The other seems headed the same way.

Heifer has lumps apparent only to the feel or touch in the lower surface of udder just beneath skin. Lumps are size of hazel nut to size and shape of a large flattened hickory nut. On these presently appears a small scab. Have persisted for some weeks. Are a little, but not much, sore. G. L.

Adams, Wis.

ANSWER.

I don't think your bull worth anything. Can't say, but be careful and cleanse everything.

Second, you have some of the symptoms of cow pox, but you have a much worse condition. You have need of an expert upon the spot, the State Veteriarian is your best resort. He has authority to look into, and control all such suspicious subjects.

Horse Owners! Use GOMBAULT'S Caustic Balsam

A Safe Speedy and Positive Cure

The Safest, Best BLISTER ever used. Takes the place of all liniments for mild or severe action. Removes Bunches or Blemishes from Horses and Cattle. SUPERSEDES ALL CAUTERY OR FIRING. *Impossible to produce scar or blemish.*

Transforming a Basement Stable into a Hog House.—Cement Floors and How to Build Them.

Mr. F. J. K., of Melvina, Wisconsin, writes for some information and advice in regard to remodeling a basement stable into a hog house, and laying a cement floor. His inquiry was referred to Mr. Theo. Louis who answers as follows:

The objection some people have made that stone walls are unhealthy for hogs may be applicable in measure to other live stock. The reason is plain, as walls are generally built solid. If an air space of from one and one-half to two inches is left in center of walls, and at intervals bound with stones running the whole width, frost will not draw through, and cause the damp conditions which prove, in long and severe winters, harmful.

Another objection is that there are seldom sufficient windows to admit light and sun. A hog house of large size, deprived of sunlight, would lose much of its effectiveness. As you have given no description further than the ground plan, I thought it well to draw you attention to these details that may be of money value in the future. However, you may overcome some of this by well arranged ventilating tubes.

The next objection would be that your pens would have to be arranged on each side of the drive way. If this is twelve feet wide, it would leave room on each side for only three pens for breeding purposes (deducting the wall) respectively 7½ by 13½ feet—large enough for that purpose. Allowing that you succeed in raising on the average seven pigs to the litter, you have forty-two pigs, not counting fall litters. You can arrange the driveway into a cemented feeding floor for that matter, and use it as a driveway just the same.

The next difficulty is that all manure (which will be considerable) must be handled from the drive way, either over the partition, or through the narrow gates over the troughs, as they would naturally be placed there. I have, of course, no conception where you would place swill tubs and feed material to be handy. The question of extra luggage and labor combined is a most serious one, and of itself would most overbalance the warm place you try to obtain.

As far as the question of cement floors being so cold for young pigs is concerned, you can overcome this by bedding two hard wood scantlings two by four, seven feet long, five feet apart, one directly under the fender against the wall or partition, and one of five feet on the open end. Let them extend one inch above the cement floor and fit in inch boards, which may be removed from time to time, during breeding season, to clean out.

The question of drainage and how to arrange for same, is left for you to solve, knowing the situation, but it must be attended to.

Now as to construction of cement floors, I will quote from Mr. Waldo F. Brown, of Ohio:

"First is, use only a good quality of Portland cement, for it only will give satisfaction under all conditions. It will stand the stamping of heavy, rough-shod horses in fly time; will not wet, and will endure a temperature of twenty below zero, as I have proven on my farm. It does cost two or three times as much per barrel as cheap grades can be bought for, but the floor will cost but little if any more, and when it is done you have a job that will give satisfaction for generations

THE FOUNDATION.

The first thing to do is to throw out the earth, and the excavation should be to solid soil. On my soil we dig down about ten inches and fill to within four inches of the top with small stone or gravel, and level it off and tamp solid. Next we fill to within half an inch of top with concrete. This is made by mixing gravel and cement, or part gravel, part broken stone, no piece larger than a hulled walnut, and part sand, will give the best concrete, and with these materials you can use to each barrel of cement five or six of gravel, three of crushed stone, and three of coarse sand, or, if the gravel is sandy, six of it and the same of stone. I use only gravel, as there is no machine for crushing stone in this locality, and use nine of gravel to one of cement. The material for the concrete must be thoroughly mixed. We measure it in a bucket, and build up a heap a foot or more deep, and beginning at one side, we shovel it over four times dry. The mixing cannot be too thorough, as every pebble should be coated with cement, so that it will adhere to its neighbor. The concrete foundation should be one solid rock when it hardens. The fifth time it is shoveled over sprinkle with water so as to thoroughly dampen it, but not so as to make it dripping wet, and now it is ready to be put down. Stake strongly some two-inch pieces at the edge of where the floor is to be made, and with a square and level get them in the right position and wheel the cement and spread it two inches at a time and ram solid. An iron pounder is best, but for a single job you can make a rammer of thick oak plank, three inches thick is best, but two will answer. Saw it eight inches square and bore a hole in the center and put an upright handle to it. The tamping must be well done, so as to leave no cavities, and in order to leave just a half inch of the finishing coat, use a straight edge, with a half inch cut-out at each end, and then as you lay it from one edge piece to the other you can get an exact half inch for the liquid stone.

Portland cement does not set as quickly as cheaper grades, and while I advise putting down the concrete as soon as mixed, if some is standing over night it will not be spoiled, but can be put down in the morning.

LAYING THE SURFACE.

As soon as the frame is filled with concrete, mix the mortar for the topping Coarse, sharp sand gives the strongest floor. I screen the sand out of gravel, from which the concrete is made, using a screen with quarter-inch meshes. Mix in a box, two parts of sand to one of cement, temper thoroughly and spread as soon as mixed, and fill to the top of frame. Turn the straight edge over and level off with it to the top of the frame, and see that the corners and edges are filled and smoothed. Lay the floor in sections about three or four feet wide so that you can easily reach across to trowel and float it smooth. Now carefully remove the edge piece and set it for the next section, using the floor for the straight edge to work on the side finished, and as you lay the second strip be careful to make the union perfect between the last strip laid and the one you are putting down. One barrel of cement, 380 pounds net, will lay one hundred square feet of floor.

Now, Sir, in conclusion, I want to say a word from long experience in hog raising. Hog houses and hog yards are better separated from barns that are used for other live stock. If one wishes to build a hog house of large dimensions, he should set it by itself and with a view to drainage and access to pasture, and the possibility of having fire in it for heating and cooking, without endangering other buildings. He should also provide it with feed room and corn crib and feeding floors attached. All this can be done economically, and have the animals under direct control. With a few good, cheap boards build sheds for feeders, and thereby save considerable labor, vexation of spirit, and building material of all kinds. To construct buildings warm and healthful, is cheap and available now-a-days, and I would think twice before reconstructing the barn.

THEO. LOUIS.

One Thing a Dairyman Cannot Afford to Be Without.

ED. HOARD'S DAIRYMAN:—Your kind invitation to renew my subscription to the DAIRYMAN at hand, and it is with the greatest pleasure that I send you $1.00 to pay for one year from Oct. 6th. Please see that I get the next number, as I do not wish to lose any of them.

I expect to more than double the size of my milking dairy within the next few years, and I consider the knowledge obtained by the reading of your paper, for the past five months, of great value to me in building up my dairy. It has caused me to make a constant study of the cow, and of my cows especially. It has taught me things that I had never dreamed of, that are of the greatest importance to any dairy farmer. I cannot afford to be without your valuable paper.

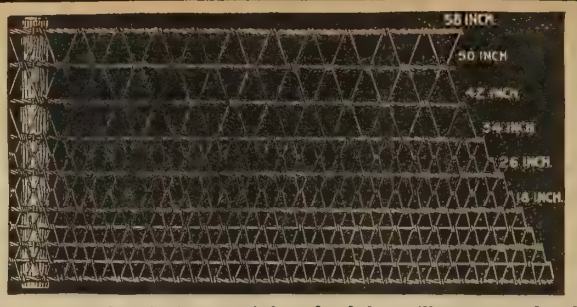
HERMAN SMITH.

Cattaraugus Co., N. Y.

Dairying in Kansas.

From the dairy statistics of Kansas, returned by assessors and just compiled by Secretary Coburn, of the Board of Agriculture, it is established that the state has this year again advanced in total output and value of her cow products.

The year's aggregate value of butter and cheese made and milk sold for other purposes is $6,643,058, the largest in the history of the state, being 9.8 per cent more than last year and $1,383,306 or 26.3 per cent more than the year before.



The total quantity of butter reported is 43,757,767 pounds, an increase over last year of 2,306,786 pounds or 5.56 per cent. Of this, 59 per cent or 25,809,112 pounds was made in families and forty-one per cent or 17,948,645 pounds in creameries. The value of the product from families is $2,839,003 and from creameries $3,031,269, making a total for the state of $5,890,272, or 10.71 per cent greater than in 1898. Mitchell county ranks first in the quantity of butter made, producing 2,217,904 pounds, followed by Reno, with 2,075,077; Dickinson 1,835,795; Sedgwick, 1,786,720; and Shawnee, 1,517,918.

The quantity of cheese reported is 1,163,680 pounds, or 255,285 pounds less than last year, and its total value is $104,731. Of the entire quantity produced 17.26 per cent was made in families, and the balance in factories The counties leading in cheese making are Shawnee, Dickinson, Jefferson, Saline, Neosho, the five being credited with a little more than one-half of the total.

The value of milk sold for other purposes than making butter and cheese was $648,054 or 5.22 per cent more than last year, and 11.16 per cent more than the year before.

While many unthinking persons may regard the products of the cow as of small importance, it is interesting to know that their total value is equal to 90 per cent of the output of the rich Kansas zinc mines and their products from Kansas smelters for the same time, and that it would pay the total state, county and township taxes for 1898, or within twelve per cent of the entire expenses of the splendid public school system for two years.

If the value of the large quantities of butter and milk consumed in the homes on the farms was added the grand total would he considerably increased, but unfortunately there is no account taken of that.

HOGS WILL ROOT

but the hog hasn't been bred that will tear up or break through the

ELLWOOD WOVEN FENCE.

Made of hard Bessemer Steel Wires, rust proof, and proof against all attacks of animals, heat or cold, dry or wet, wind or weather. Although the best, the **Ellwood costs but little** and is practically everlasting. Your dealer ought to have it. If he hasn't write for catalogue, etc., to

AMERICAN STEEL & WIRE CO., Chicago or New York.

FAST GRINDING

and perfect grinding is best done with this

Scientific Grinding MILL.

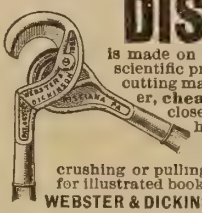
It is double action as both top and bottom plates revolve. Grinds ear corn, all small grains. Supplies power for other purposes at the same time. Other styles 2 to 50 h. p. Before you buy send for our descriptive catalogue, I.

FOOS MFG. CO., Springfield, Ohio.

YOU CAN PREVENT BLACKLEG

among your cattle by the use of Parke, Davis & Co.'s **BLACKLEG VACCINE.** Every lot is tested on cattle and found reliable before a single dose is put on the market. It will prevent **BLACKLEG** if fresh product is used, the same as vaccination prevents Smallpox in the human family. Operation simple, and easy to perform. Specify P. D. & Co.'s, and get the kind that is always reliable. For sale by all druggists. Write us for literature and full information, free on request.

PARKE, DAVIS & COMPANY, Detroit, Michigan.



BRANCHES: New York City, Kansas City, Mo., Baltimore, Md., New Orleans, La., Walkerville, Ont., and Montreal, Que.

THE DROWN PATENT COW STALL guarantees perfect comfort to the cow and cleanliness of milk. This gives greatest economy of food. NO TIES. It costs more not to have than to have it. Send for information to H. C. DRAKE or M. J. DROWN, Madison, Wis., for Wisconsin; other states, M. J. DROWN.

Mention HOARD'S DAIRYMAN when writing.

The Improved CONVEX DISHORNER

is made on a different, better, and more scientific principle than any other horn-cutting machine. It is simpler, stronger, **cheaper**; easier to operate, cuts closer and more smoothly, more humane. The only dishorner that cuts all kinds, shapes, and sizes of horns without crushing or pulling them apart. Write at once for illustrated book on dishorning—free.

WEBSTER & DICKINSON, Box 67, Christiana, Pa.

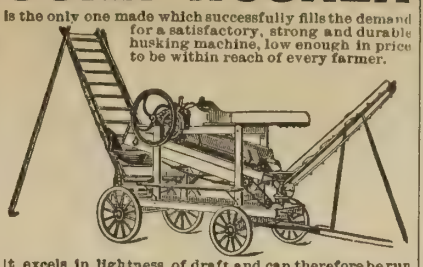
ADAM THE FENCE MAN

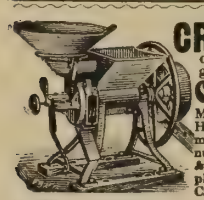
Makes Woven Wire Fence that "Stands Up." Cannot Sag.

Get his new catalogue. It tells all about The Best Farm Fence Made.

W. J. ADAM, Joliet, Illinois.



HAVE YOU A SILO?
Then you will need ensilage machinery.
THE ROSS ENSILAGE MACHINERY
is unsurpassed in quality, capacity, durability and ease of operation. Doubles the value of a corn crop. Catalog No. 7 Free.
The E. W. Ross Co. Springfield, O.



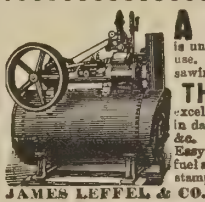
NO USELESS GEARS
in this mill to absorb and waste power. It is a simple, direct grinder, of large capacity and requires small power. The **ELECTRIC FEED MILL** cuts, crushes and grinds ear corn and all small grain, converting the whole into fine or coarse feed, according to adjustment. Meets the demand for a good mill at a fair price. Circulars free. Electric Wheel Co, Box 136, Quincy, Ill.

"OHIO" SELF FEED ENSILAGE CUTTER
Cuts 33⅓ % more than regular machine.
Saves 75% in time.
Positively feeds itself. No pushing to get feed started, and feeds evenly saving power. New wide throat—wide as knives are long. New large hood—gives increased space for cut feed, avoids re-cutting, binding, choking, &c. The cut shows
NEW METAL STRIP SWIVEL CARRIER.
Has 2 inch steel strips—carries more feed and easier. Works at any angle—any length. Without extra section at bottom. 1899 catalogue FREE. Prof. Woll's "A Book on Silage" 10c.
THE SILVER M'F'G CO., Salem, Ohio.

THE APPLETON CORN HUSKER
Is the only one made which successfully fills the demand for a satisfactory, strong and durable husking machine, low enough in price to be within reach of every farmer.

It excels in lightness of draft and can therefore be run to do a satisfactory amount of work with less power than any husker made. If you want a husker, sheller, ensilage or fodder cutter, shredder, wood saw, grinder, sweep power, tread power, wind mill, etc. we can furnish you the best. Our 160-page catalogue will convince you. IT IS FREE.
APPLETON MFG. CO., 35 FARGO ST., BATAVIA, ILL.

Fall Grains
need a good start to stand the winter; therfore feed them well in the beginning. This will produce hardy plants with plump grain. A good fertilizer should contain plenty of
Potash
Potash increases stiffness of stalk and plumpness of grain.
Our books tell the rest—sent free.
GERMAN KALI WORKS,
93 Nassau Street, New York.



CRUSH AND GRIND
corn and cob and all kinds of grain, single or mixed, on the **Quaker City GRINDING MILL.**
Makes perfect feed or family meal. Has ball bearings—less friction and minimum power. Send for 31st Annual Catalogue. A. W. STRAUB & CO., 3737 Filbert St., Philadelphia, Pa., The A. W. STRAUB CO. Canal & Randolph Sts., Chicago, Ill.
Also Western agents for Smalley Powers, Shellers, Cutters, &c.

Dick's Cutters
Cut Faster and Finer than all others.
This is not idle talk, it's so. They first split all feed with one set of knives and then cut it off with another set. It thus makes
FINE SOFT FEED
easy to masticate and digest.

MAKE THE BEST ENSILAGE
because being finer it packs more firmly, excludes more air, ferments less and is consequently sweeter and more palatable. **Made in many sizes for hand and power.** Power machines equipped with any desired length of carrier. Cut any length. **Safe, fast and efficient, strong, durable and lasting.** Ask your dealer for Dick's, and send to us for catalogue.
DICK'S AGRICULTURAL WORKS, Box 20, Canton, O.

HEEBNER'S Patent Level Tread Horse Power
with Speed Regulator.

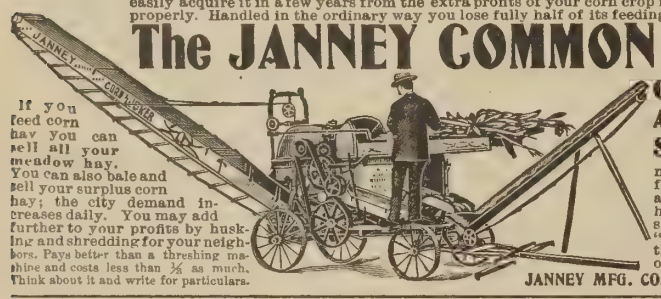
SMALLEY MFG. COMPANY, Sole Makers, MANITOWOC, WIS.

MAKE ONLY SWEET ENSILAGE

Ever since the ensilage system has been introduced in this country it has been the ambition and effort of siloists to ***produce sweet ensilage.*** The making of sweet ensilage depends principally upon two things—***1st.*** the use of a well matured crop and ***2nd.*** upon low fermentation. Granting the maturity of the crop, shredded ensilage makes the sweetest ensilage. The reasons are, that shredded material is of a nature that makes it pack much more closely in the silo. That means exclusion of air; there can be no extreme fermentation and consequent development of acid without the free action of the air. ***Shredded ensilage possesses other advantages in addition to its sweetness:—*** it is eaten with great avidity by animals, being a long, soft substance and free from any sharp angles and corners to cut or lacerate the mouth and gums; it is therefore fed with less waste,

The best way to Shred Ensilage is with the

St. Albans Ensilage and Fodder Shredder.



It is the Original Shredding Machine and all other so-called shredders are merely imitations of this one. ***It will certainly pay you*** to look into the merits of this proposition and machine before buying. We mail free a pamphlet on the subject.

ST. ALBANS FOUNDRY CO., ST. ALBANS, VT.

IT WILL BUY YOU THREE FARMS

Wouldn't you like to have more land! A nice farm along side of yours for your boy! You can easily acquire it in a few years from the extra profits of your corn crop if you will only handle it properly. Handled in the ordinary way you lose fully half of its feeding and marketable value.

The JANNEY COMMON SENSE CORN HUSKER AND FODDER SHREDDER

If you feed corn hay you can sell all your meadow hay. You can also bale and sell your surplus corn hay; the city demand increases daily. You may add further to your profits by husking and shredding for your neighbors. Pays better than a threshing machine and costs less than ⅓ as much. Think about it and write for particulars.

makes it easily possible for you to increase your acres. Listen—First it husks all the corn and shreds the fodder into "corn hay." Corn hay is the equal in feeding value of best timothy hay.

JANNEY MFG. CO., Box 29, Ottumwa, Ia.

Use Your Power

THE NEW BOOK Feeds and Feeding

By Prof. W. A. HENRY, Wisconsin Experiment Station.

This book should be in the hands of every stock feeder in the country. Every reader of HOARD'S DAIRYMAN ought to have it. It is a large, well bound book, nicely printed, over six hundred and fifty pages. Price $2.00

Four Yearly Subscribers at $1.00 Each ($4) Will Secure It as a Premium.

Four Yearly Subscribers at $1.00 Each ($4) Will Secure It as a Premium.

Of This Book Hon. JAMES WILSON, Secretary of Agriculture, Washington writes as follows:

"Prof. W. A. Henry, Dean of the Agricultural Department of the University of Wisconsin, has recently given to the American student and the American farmer a work on feeds and feeding. Singularly enough, up to this time we have had nothing along this line sufficiently comprehensive from both the scientific and practical standpoints. We have had very able works from both, but Prof. Henry is the first to combine science with practice, and give us a work that will be of value alike to the instructor in the Agricultural College, to the student who is seeking the principles underlying feeding, and to the practical farmer who feeds.

This publication will take its place immediately in the college library, and ultimately in the private library of every farmer in the land. When the instructor, student or practical farmer inquires where there is a work thoroughly exhaustive of this subject, he can now be referred to Prof. Henry's book.

Sent as above, or will be forwarded, carriage paid, on receipt of price, $2.00.

DAIRY AND STOCK FARMERS

Will do well to inquire about the fine meadows in Aitkin county, Minnesota, where splendid stock lands can be bought for $3.00 to $5.00 per acre on 10 years time at 6 per cent interest. Cheap railroad rates whether you buy or not. For maps, rates and further particulars write L. B. ARNOLD, Agent, 901-5 Guaranty Building, Minneapolis, Minn.

HOUSE **SAVOGRAN** FOR CLEAN CLEANING **INDIA ALKALI WORKS,-BOSTON.**

Medals—Bronze 1878, Silver, 1887, World's Fair, 1893.

A Good Time . . . to overhawl your factory and make improvements is in the fall of the year, when the butter output is small as compared with spring and summer. You are not rushed now and have time enough to make your improvements right. However, in order to make sure of doing this work right, you should begin right, and a good start in this direction will be the placing of . . .

A Tubular Separator which, as you may possibly know, is acknowledged by impartial judges to be almost perfection itself in a cream separator. The Tubular has no equal; it excels all other separators in every particular. You will do well to write us for descriptive circular.

The Squeezer Combined Churn and Butter Worker in your factory would also be the right thing in the right place. Your old box churn has served its time and should be replaced with an up-to-date machine like the SQUEEZER. Possibly you have been induced to purchase one of the complicated combinations known as a churn and butter worker, and which were designed before experience had demonstrated what features are essential to the successful operation of such a churn. If you are struggling along with a machine of this kind it will pay you to discard it and get the latest thing out; the only simple and durable combined churn and butter worker; the well-known SQUEEZER.

A Russian Babcock Tester will save you much time and worry. It is always ready for action; always accurate; automatic in its action and the most durable tester made. We can supply you with the best of everything to refit your factory and will be pleased to name prices on our full line of . . . . .

Vats, Churns, Butter Workers, Boilers, Engines, Pumps, Piping, Butter Printers, Milk Cans, etc., etc.

The Sharples Company,

28, 30 and 32 So. Canal St., - CHICAGO, ILL.

I Find that the Tubulars are the "Boys" that can do it, not only in Test but in the Condition it Leaves the Cream in

This is the incontrovertible evidence of a practical creameryman of large experience as is evidenced by his letter given in full below. Like many other creamerymen he bought a large amount of expensive experience before he "got right." Our object in publishing this experience is to warn others against such mistakes. Start right and be right for all time by buying the unequaled, economic and absolutely safe

Sharples Tubular Separators.

BRISTOL, ILLINOIS. Aug. 18, 1899.

The Sharples Company, Chicago, Ill.

Gentlemen: By request of your representative, Mr. S. F. Greene, I will give a synopsis of my experience in creamery work.

In the spring of '95 I purchased a hand separator (De Laval) and 20 gal. churn, for my use in a little dairy of 33 cows. On the morning of July 5th my first patron delivered 75 pounds of milk, which I tallied on the wall, that being my weigh sheet for several weeks. My neighbors commenced coming with their milk, and the handles were soon displaced with wooden pulleys, and a tread power installed to drive the machinery.

In Dec '96 all of this machinery was thrown out and replaced with a steam engin, 150 gal. churn and an Acme separator. On the following June all of this machinery was again displaced by larger, as my old outfit was inadequate to handle the milk received, which was 4000 pounds daily and steadily increasing.

My present factory is equipped with two boilers 90-horse power capacity, 25-horse power engine. Ice plant, No, 7 Barber Combined Churn and Butter Worker, two Sharples Tubular Separators, Skim Milk Weigher, and a complete condensing outfit, and my daily run will average from ten to sixteen thousand pounds of milk.

In closing allow me to say a word for the Tubulars. I have always used Alphas and thought they could not be beaten, but by actual experience I find that the Tubulars are the "boys" that can do it, not only in test but in the condition it leaves the cream. They are very simple and easy to manage, requiring very little oil and steam to run them and their average tests are from two to five one-hundredths.

I have found that you have not over estimated your recommendations for the Tubulars.

Yours respectfully,

FRED G. YOUNG.

We comment further only by saying that the Tubular—Has a hollow bowl, is a close skimmer; has no spindle; it spins on air; it is economical of power, oil and repairs; it is absolutely safe and burst proof.

A POWERFUL **Disinfectant** That is ODORLESS, NON-POISONOUS. Used in Creameries, Cheese Factories, Dairies and Stables.

IT DOES NOT Create an Oder to Destroy One.

SAN FRANCISCO, Sept. 22d, 1896.
I have used "Purifine" in cleansing milk cans and bottles and find it will remove the bad odor left by old sour milk more effectually than anything I ever tried.
E. A. GREEN. Sec'y,
Millbrae Dairy Company, Mission & 9th.

Applied with large quantity of water, which makes it **cheap and convenient of use.** It is invaluable to the cleanly dairyman or factory operator. Once try, you'll never be without.

SEND $1.00 FOR SAMPLE GALLON by Freight.

This powerful disinfectant creates no odor of its own, but will keep creamery, cheese factory and dairy pure and sweet. TRY IT ONCE.

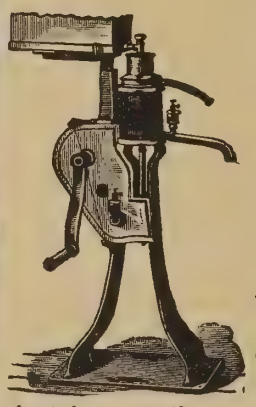
PITCH CHEMICAL COMPANY, Bay City, Michigan.

The YOUNG AERATOR And Cooler

Needs no water or ice, removes all odors and gasses. Warranted to keep milk sweet from 6 to 12 hours longer than any machine on the market or money refunded. Circulars free.
W. H. YOUNG,
Box 135, Aurora, Ill.

HARVEY'S ANTI-SUCKING BITS For Cows and Calves.

A Specially Constructed Hollow Bit to Prevent Cows and Calves from Drawing Milk.



Will be sent postpaid for 50 CENTS.
Will be sent as a premium for
ONE NEW SUBSCRIBER.

The Reasons for the Superiority of the

Improved United States Separators

are well known to all who understand the principles of

CENTRIFUGAL SEPARATION.

For the enlightenment of those who do not understand these principles, those who have not studied into them and wish to understand them, we will send a catalogue explaining and illustrating separator facts and differences for the mere asking.

THE IMPROVED UNITED STATES SEPARATORS embody principles contained in no other, which makes them **more efficient in operation,** more simple in construction and greater wearing qualities.

The rapid increase in sales is phenomenal. None can truthfully boast of such a record.

The GENESEE SALT COMPANY,

Through their **EDUCATIONAL CHEESE CONTEST** held in Chicago in October, will distribute to cheese makers who are regular users of Genesee Factory Filled Cheese Salt, **$150.00** as follows:

CLASS 1—American Cheddars and Flats.	
1st	$20.00
2nd	10.00
CLASS 2—Twins and Young Americas.	
1st	$20.00
2nd	10.00
CLASS 3—Edam, Pineapple and all Spec'l Shapes.	
1st	$15.00
2nd	5.00
CLASS 4—Brick and Block (Domestic.)	
1st	$10.00
2nd	5.00
CLASS 5—Swiss (Domestic.)	
1st	$10.00
2nd	5.00
CLASS 6—Best Box of Limburger, Brie, Club or other Fancy Cheese.	
1st	$10.00

Write to F. A. TRIPP, 34 Clark St., Chicago, for ENTRY BLANKS, or

THE GENESEE SALT COMPANY, New York.

A Hand Separator

to be profitable must not only extract every particle of butter-fat from the milk, but must run so easily that it does not require the strength of a giant to turn it. We guarantee the

Empire Cream Separators

to run 50 per cent. easier than others of equal capacity. Their record for clean skimming is unequalled. We have the most complete line of hand separators in America; also power machines.

We have not space here to tell you why the **Empire** machines excel all others, but it's all in our catalogue. Send your address if you have one cow or one thousand.

U. S. BUTTER EXTRACTOR CO., Newark, N. J.

DAIRY AND STOCK FARMERS Will do well to inquire about the fine meadows in Aitkin county, Minnesota, where splendid stock lands can be bought for $3.00 to $5.00 per acre on 10 years time at 6 per cent interest. Cheap railroad rates whether you buy or not. For maps, rates and further particulars write L. B. ARNOLD, Agent, 901-5 Guaranty Building, Minneapolis, Minn.

A SUCCESSFUL IOWA DAIRY FARMER.

Mr. W. C. Ballou, of Littleton, Iowa, furnishes a very good illustration of the idea that success with cows can be had everywhere if only the man himself is right in judgment and action.

From the milk of twenty-six cows Mr. Ballou made in 1898, 7,247 pounds of butter, an average of 287½ pounds for each cow. The butter was marketed in Independence at an average price of twenty-one cents per pound, a total of $1,521.87. The average cash earning of each cow was $58.53. In addition to the butter sold, Mr. Ballou has raised twenty-four calves, which would bring the actual value of the products of his herd for the past year up to over $70 per cow.

Some of the neighbors of Mr. Ballou, who are contented with cows that pay less than the cost of their keeping, should interview him as to the cause of the difference between their returns per cow and his.

PRINCESS OF WAYNE 7TH.

It gives us much satisfaction to present herewith a picture, true to life, of the Holstein-Friesian cow, Princess of Wayne 7th, and in connection therewith, the letter of Mr. Hoxie, giving the particulars of her remarkable performance, June 16-22. The reported yield of milk and butter fat is much less than is frequently claimed; indeed, is so modest as to challenge instant credence. Reduced to its equivalent butter, by the rule adopted by the association of American Agricultural Colleges and Experiment Stations, the amount would be only twenty-three and one-half pounds, and yet there was a net profit of 58½ cents per day over the cost of feed consumed. Stated in another way, the food cost of the butter was 6.1 cents, with prices at a fair average for the whole country and a succession of years. Indeed, pasturage, which counts for more than half of the total cost, is rated very high, being over $10 for the season, whereas, in a Cornell *Bulletin*, issued in 1893, 30 cents per week is given as the average for thirteen counties in New York. The price allowed for butter fat, 25 cents per pound, is also well within the limits of moderation.

It may be interesting to give the average daily allowance of feed, with an estimate, from the feeding tables, of the contained nutrients. We get this by dividing the total feed consumed by seven, and have the following results:

	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
50 lbs. pasture grass (amount estimated)	10.00	1.25	5.10	.25
15 lbs. silage	3.96	.20	2.10	.09
4 lbs. bran	3.52	.50	1.54	.12
4 lbs. corn meal	3.56	.32	2.67	.22
2 lbs. oil meal	1.82	.59	.65	.10
2 lbs cotton seed meal	1.84	.74	.34	.18
Totals	24.70	3.60	12.40	.96

We have estimated the pasture grass consumed, at the lowest probable amount, and yet find the protein and fat much in excess of the amount given in any of the standards, and the temptation is to conclude that the standards are at fault. We beg to remind all those who may be inclined to this opinion that Prof. Clinton D. Smith, of Michigan, and Prof. Haecker, of Minnesota, have demonstrated that, for cows yielding up to as much as two pounds of butter per day, two and one-fourth pounds of protein in the ration is all-sufficient. We are not justified in saying that such an amount would suffice when the yield is over three pounds of butter per day, but as the farmer will usually be satisfied with the smaller of the above yields, as a regular business for even his best cows, he will not need to supply them with so much protein.

It should be added, in passing, and in justice to Princess of Wayne 7th, that her total grain allowance was much below that sometimes reported in connection with large yields.

With the above facts before us, it remains to inquire whether there is anything in the form of this cow, as shown by her picture, to confirm the theories of HOARD'S DAIRYMAN, or to require their modification? Judged by the record and picture of Princess Wayne 7th, have our teachings been sound? Does this cow have the "dairy form"? Or does she partake more of that "milk and beef form" which appears to be the preference of so many Holstein breeders? In the "Outlines of the Advanced Registery System" these forms are described as follows:

MILK AND BEEF FORM: This is the prevailing or average form of cows of this breed. It describes a cow of the wedge form, with shoulders moderately thick, moderately deep and broad, crops moderately well filled, barrel well rounded, loins and hips broad and full, and quarters straight, wide and full.

MILK FORM: This describes a cow of the wedge form, comparatively light in the shoulders and chest, and comparatively light in the quarters. It is generally accompanied (though not always) with angularity of appearance.

It is to be regretted, of course, that this cow's udder, is not more symmetrical, but the circumstance taken in connection with her record, suggests that possibly we have been accustomed to place too much emphasis on the shape and symmetry of this organ, and this more especially in estimating the value of a cow for purely dairy purposes. Indeed, some of the best judges of cows claim that the udder may be a very misleading indication of the ability of a cow to return a profit at the pail. It is to be said, however, that a fine, well balanced udder is no detriment to a good cow, but adds very decidedly to her appearance and value in the market, and is a point to be striven for by every breeder.

PRINCESS OF WAYNE 7th.

Property of T. G. YEOMANS & SONS, Walworth New York.

Net Profit Tests for Holsteins.

Record of Princess of Wayne 7th.

ED. HOARD'S DAIRYMAN:—At the recent annual meeting of the Holstein-Friesian Association, rules were formulated for making net profit tests. The first test under these rules was made June 16–22 inclusive, of the cow Princess of Wayne, 7th., owned by T. G. Yeomans & Sons, Walworth, N. Y. It was under the supervision of Ass't. Prof. Anderson, of Cornell University. During the seven days of the test the cow consumed 105 pounds ensilage, 28 pounds wheat bran, 28 pounds corn meal, 14 pounds oil meal, 14 pounds cotton seed meal, besides pasturage. The cost of food, per prices fixed by the rules for all sections, (pasturage, 75 cents a week; ensilage, $2 a ton; wheat bran, $10; corn meal, $12; oil meal, $18, and cotton seed meal, $20) was $1.43. She gave 487⅞ pounds milk, containing 19.285 pounds butter fat, the value of which per prices also fixed by the rules (25 cents a pound for butter fat and 15 cents a hundred for skim milk) was $5.52. The net profit is $4.09.

Prof. Anderson tested her for butter fourteen days. During this test she gave 952 1-16 pounds milk, which averaged slightly above 3.94% fat, showing a total fat product of 37.55 pounds, which by the Chicago World's Fair rule, is equivalent to 46 pounds, 15 ounces butter. By the same rule the product during the week of the net profit test is equivalent to 24.1 pounds butter. The highest per cent of fat in the total milk of one day was 4.42, and of one milking 5.4.

At the present time there is a manifest tendency on the part of a class of writers on dairy subjects to deprecate short tests like the above. The special peculiarity, just now, of this tendency is that it comes from those who have been glorifying short tests, for a number of years, made under questionable conditions. That Holstein-Friesian cows are persistent milkers, has been demonstrated by more than a thousand tests, extending from ten months to a full year. The dam of this cow, Princess of Wayne 7th., at eleven years old, made a year's milk record of 29,000 11-16 pounds, and one of her grand dams, at eight years old, a year's record of 1,153 pounds, 15¾ ounces of butter.

Yorkville, N. Y. S. HOXIE,
Sup't. of Advanced Registry.

A Hustler.

ED. HOARD'S DAIRYMAN:—One of the great missions of your paper is to open men's eyes and make them discontented with poor methods, and then make them hustle to do better. This was fully illustrated in the interesting article written by A. G. Judd, page 638. He wields the pen of a ready writer, and his record shows that he was a hustler. He went to work with a herd of general-purpose animals. Why? Because he did not know of anything better. Blackstone nor Cooley on Torts, nor any of the eminent authorities he studied took any pains to enlighten the young man on the difference between a cow that produced 3,000 pounds of milk or one that produced 6,000 or 7,000 pounds. He had studied Dr. Blackstone, but had never sat under the modest teachings of Dr. Babcock, and notwithstanding this disadvantage, with his disposition to work, feed, and hustle, he gradually gained ground, driving the sheriff and interest gatherer to the rear.

Soon more light began to dawn. A man, no doubt, sent from the heaven of better dairying, appeared to him—not in a dream, but in real earnest—and opened his eyes, not by abusing him and saying mean things about his herd. Oh, no! He praised them and said they were sleek and fine—but suggested that he feed bran and take a good dairy paper which were unheard of tidings to him. Being a hustler and not content to remain in the rear, bran began to be received by the car load; he quit sleeping, and worked by day, and read HOARD'S DAIRYMAN at night.

Being a student he soon discovered, by reading, that among the different grades of Short-horns, there was a special dairy class; so, acting according to his new light, he did not buy a common fifty dollar animal but he whacked up $125 for a special dairy bull. Still light in the night continued to pour in, and he read of another special-purpose breed, the Holsteins, bred for hundreds of years for the purpose of producing milk. He bought one, hoping thereby to increase the value of his herd. His own language says, it was the most complete success imaginable. His herd now suits him. He talks of mortgages gone, rubber-tired surries, family well dressed and living in luxury.

No scrub cow or scrub farmer about him! He is a hustler. No young farmer will ever fail who pursues the course he did, and if he ever feels like returning thanks, he should do so for his existence in a land of progress; thank his friend for his timely advice; thank HOARD'S DAIRYMAN for removing the scales from off his eyes so he could see the beauty and profitableness of the special-purpose dairy animal that has wrought such great things for him.

A. J. PHILIPS.

Coming Events.

Kansas Dairymen's Association, Manhattan, Nov. 22-24, 1899.
Pennsylvania Dairy Union, December 5-6, 1899, West Chester, Pa.
New York State Dairymen's Association, Cortland, New York, Dec. 13-15, 1899.
Pennsylvania Dairymen's Association, Union, Dec. 5-6, 1899.
Minnesota Dairymen's Association, Le Sueur, Dec. 12-14, 1899.
Vermont Dairymen's Association, Brattleboro, Jan. 9-11, 1900.
Tennessee Dairymen's Association, Sweetwater, Jan. 25, 1900.

THE editor of a prominent New York daily has snatched the following bit from his reservoir of wisdom and sent it on its travels for the benefit of mankind in general and New York in particular: "The hog suffers from chronic indigestion, and like the dog he does not sweat, and consequently is not fit to eat." If the New York editors could only have control of the universe—

THE EFFECT OF DIRTY MILK.

In the mind of a great many careless and indifferent people all this talk about cleanliness in the dairy is sheer nonsense. They happen to have never seen any bad effects from of their own dirtiness, or if they did see it they did not know it. But nevertheless whether they know it or not, dirt is dangerous in milk; dangerous to health, dangerous to flavor, and consequently dangerous to profit. Everyone nearly has heard of cases of poisoning from milk, ice cream, or cheese. This poison is called tyrotoxicon, and belongs to a family of poisons called ptomaines. Prof. Vaughan, of the Michigan University, has studied and traced out the history, character and source of these poisons to a greater degree than any other living man. Consequently what he has found out ought to be of value to any man who knows enough to appreciate knowledge.

Prof. Vaughan found that the almost invariable source of such poison, when found in milk, or the products of milk, was simply filth. The men or women who handled the milk were dirty in their ideas of milk handling and allowed the surroundings to be dirty and the milk utensils to be badly cleaned. Here is one of many cases or facts which will emphasize the value of this preachment for clean work in the dairy.

For some time city physician Nottingham, of Lansing, Mich., has been at work urging those dairymen who supply the city with milk, to take greater pains to keep their stables and utensils clean and sweet.

The other night several families on the east side of the city were poisoned by using the milk which came from one of the dairies which had been ordered cleaned. No doubt the owner of that dairy thought in his wisdom that all this talk about the necesssity of rigid cleanliness was all humbug. Now he stands with a ruined business, all because he would not post himself as to what is the truth. How shall a man know the light, who refuses to open his eyes.

C. P. GOODRICH ON FEEDING COWS.

Let me illustrate how I would feed. Suppose I had mixed hay and corn fodder for roughage and plenty of corn and oats.

I would have for the grain part of the ration ground corn, corn and oats, and bran, one-third each by weight. Now when we come to practice we find that scarcely any two cows can be fed alike. Now cow number one eats up her food readily, her grain food being ten pounds, given in two feeds daily. If I find after feeding her a while that she gives only a moderate mess of milk, but is putting on fat. I would reduce or entirely leave out the corn in her food and replace it with bran, or better still, gluten meal, or perhaps a part cotton seed meal. This would, if she is a cow fit for the dairy, stop the tendency to lay on fat and increase the flow of milk.

Cow number two I feed the regular ten pound ration. She eats it up greedily and gives a large mess of good milk. This is a hint to me, so I increase the ration to twelve pounds; she eats it quickly and gives more milk. I then increase it to fifteen pounds, and she still eats it up readily, and also eats a large amount of coarse fodder. This cow is making a good dairy use of her food, for with every increase in food there is a corresponding increase in milk, but she is all the time losing flesh. What shall I do? This can not long continue. If she is not fed differently she will milk herself down to a skeleton and then the milk flow must of necessity drop off or she cannot live. I will tell you what I will do. I will feed her more corn meal in place of some of the bran. I will change the ration gradually till I get her so that she can hold her own. This cow is a thin dairy cow, such as the dairyman needs to make his business profitable.

Now it will be seen why I say the feeder must become acquainted with his cows in order to make the most profit out of them.

INQUIRIES AND ANSWERS.

Every inquiry must be signed with the name, Post-office and state of writer. Condense the questions into plain specific inquiry. Be careful to note if your questions have not been answered in replies to others. We are glad to answer all the pertinent questions that we can concerning machinery. Look over our advertising columns and write to the advertisers.

FEEDING STANDARDS FOR MILCH COWS.

Dry matter.	DIGESTIBLE NUTRIENTS		
	Protein.	*Carboky-drates.*	*Ether extract.*
lbs.	lbs.	lbs.	lbs.
23 to 28	2.0 to 2.5	12 to 15.0	0.5 to 0.8

COTTON SEED.

Please let me know the value of cotton seed, ground, but not the oil taken out. Is it suitable for feed for dairy cows, and how much should be fed? Which is the cheapest with bran at $9 per ton? G. L.

A good deal of cotton seed is fed to cattle in the south, and in many cases to milch cows. It is not ground, but fed whole, and either roasted, boiled or raw, but which form is the more profitable is still open to question. Carrying, as it does, such a high per cent of oil, the amount that can be used without injury to the cow or her product is somewhat limited and should not exceed four to five pounds. This quantity does not furnish sufficient protein, and for this reason, as well as for other considerations, it is advisable to use some bran or other similar feed in connection with the seed. On the whole we count it about equal to bran in feeding value.

BITTER CREAM—CEMENT FLOORS.

We have trouble with our cream during the winter and late fall months. When fresh from the separator (we use an Alpha Humming Bird) it is very sweet and perfectly satisfactory. In twenty-four hours it will have a very unpleasant, bitter taste, which spoils the cream for market and renders it unfit for butter. The taste is not that of cream kept too warm, but is something I have never encountered before. Change of feed makes no difference. Our cows are healthy, or seem to be, are kept clean, fed well, have a good stable, and are well cared for. Our milk room is for milk and cream only; it is kept scrupulously neat and so are our pans, pails and separator.

Can you tell me what is the trouble, and what to do for it?

Do you advise the use of cement floors in the cow stable.? J. R.

Michigan City, Ind.

The fact that your trouble occurs only during the cold months, points to a low ripening temperature, or keeping your cream too long at a low temperature before ripening.

Bitter cream frequently results from such long keeping in the cold and the remedy is more frequent churning, thus preventing the growth of the bitter producing bacteria.

Or it may be that you have a quick growing, bitter producing bacteria. If so, give all dairy utensils a thorough scalding and washing with boiling water and then obtain from some other dairy some clean, pure flavored, sour skim milk and use this for a starter in your next batch of sweet cream.

If one has plenty of bedding so that the cows can be kept from the chill of the stone floor, and plenty of help to handle the large amount of bedding required, there is nothing better than a cement floor.

As regarding cleanliness and the ease with which the stable can be cared for there is nothing better than a good cement floor, but unless plenty of bedding is at hand, rheumatism and udder troubles more than counterbalance its advantages.

A compromise, whereby the walks, gutters and mangers could be built of cement, with a plank or dirt platform for the cows to stand on would contain all the advantages of a cement floor in cleanliness, with but few if any of its bad points.

WOOD ASHES AS AN ABSORBENT.

In your opinion would wood ashes make a good stable absorbent? SUBSCRIBER.

St. Lawrence Co., N. Y.

We should not like to use wood ashes for this purpose, if for no other reason than that the resulting "lye" would be apt to injure the feet.

AS TO COW PEAS.

Please answer through your paper, the following questions regarding cow peas, and corn for ensilage:

1. How many tons of peas per acre is a fair yield on land that yields fifty bushels of corn?

2. At what stage are peas best for cutting into silo?

3. What objection can there be to cutting into silo alternate loads of corn and peas, thus having a better balanced ration?

4. Will peas and oats drilled together make a good ensilage?

5. Will land planted in peas for several years, and crops all cut off, be increased in fertility by the pea roots and stubble?

6. Is it profitable to use commercial fertilizers in growing peas? C. F. O.

Murfreesboro, Tenn.

As we are out of the cow pea belt our information is second hand, but answering according to our best information and belief, we should say:

1. From six to twelve tons.

2. When the greater part of the seeds are fully formed and have not commenced to ripen.

3. None whatever, provided both crops are at proper stage of maturity. Indeed, it has been suggested that the peas be planted in the corn rows and harvested with the corn.

4. No. The hollow stems of the oat straw contain too much air.

5. This will depend upon the character of the soil, its chemical constituents and the thoroughness of cultivation. As a rule, continuous cropping with one variety of grain is not to be recommended.

6. Only experiments on your own land can determine this question.

DUTCH BELTED CATTLE.

Can you tell me where I can get any Dutch belted cattle in Wisconsin or any states joining Wisconsin? If you know of any breeders I should like to know where they are. D. A.

Melvina, Wis.

We have to confess entire inability to answer this question. In fact, we know of only one small herd of these cattle in Wisconsin and presumably none of them are for sale. As a rule, people, who have cattle to dispose of, advertise through the papers which circulate among their prospective customers. Those who have dairy cattle expect to sell to dairy farmers and would naturally place their advertisements in dairy papers, while those who raise the beef breeds would prefer papers that are especially interesting to men who raise and fatten cattle for the butcher. The fact that no advertisements appear any where is prima facie proof that the owners are not anxious to see or hear from buyers.

A VIRGINIA RATION.

Will you kindly advise me what would be a well balanced ration for our herd of cows, taking into consideration the following feeds, which our market here affords:

Timothy hay (Western) at $15 per ton; clover hay (Western) $12.50; corn meal, $20; ground corn, $10; cotton seed meal, $18; cotton seed hulls (16⅔% meal), $10; corn bran, $8.50; wheat bran, $16.

Our herd consists of about forty-three cows, mostly Jerseys and grades, but we have a few Holsteins (eight in all) with one or two of other breeds; we have only been in the business a short time, and have found it very hard to get a reasonable production, as we haven't a silo, as yet, and cannot get the advantage of silage. Our cows are considered very good ones (around this country) and some of them are very finely bred stock, although many of them are rather small; our herd would probably average in weight 900 pounds, through. We have, up to now, used cotton seed hulls mixed with 16⅔% cotton seed meal, and some wheat and corn bran, and *but little hay*. We have been reading your paper for some time, and have concluded that perhaps we have been using too much of the cotton seed hulls, when it might be better to use hay and other feeds. Please advise us in this connection, and say what you think would increase our milk production, even if it made the cost larger. Up to now our feed bills have averaged about ten cents per day for each cow, and production less than two gallons per cow per diem.

Danville, Va. F. D. Co.

Seventeen pounds of milk for ten cents is not such a bad showing, provided it cannot be improved upon, and that can only be determined by trial. We do not like to condemn that mixed feed without any inspection, but we are always suspicious of all kinds of mixtures, as they afford opportunities for using material that is not up to standard, or for charging an exorbitant profit. If one should buy five tons of hulls for $25, and one ton of meal for $18, and do the mixing himself, he would have a similar feed and

costing him about $3 per ton less. But good corn bran at $8.50 would be cheaper and better than hulls at $5.

We are of the opinion that good cows, if permanent shrinkage for the present period of lactation is not permanently established, ought to have not less than the following daily allowance:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
15 lbs. clover hay....	12.71	1.02	5.36	.26
6 lbs. corn bran.....	5 45	.44	3.59	.28
2 lbs. ground corn..	1.78	.16	1.33	.09
2 lbs. C. S. meal....	1.84	.74	.34	.18
Totals.....	21.78	2 36	10.62	.81

It is true this ration will cost fully fifty per cent more than the other, but it must not be expected to produce fifty per cent more milk. The extra cost is five cents per cow per day, and if it produces six cents worth more of milk, there is a profit of twenty per cent on the extra cost.

SOURCES OF TAINTED CREAM.

I always like to read the DAIRYMAN, and find often just the thing I wanted to know, but there are still some questions in regard to butter making, which remain in the dark. For months we will have no trouble about the flavor of cream and butter, and sometimes it in will be off flavor at once, the cream will smell bad as it turns sour, although we did it the same way as before. We always practice the utmost cleanliness on all utensils, sun them and scald them every day.

I visited a neighboring creamery this spring and the butter maker told me that he always got one-half cent above highest quotations for his butter. Asking him if he was never bothered with bad flavor, he said, no. Looking around his creamery, I thought it was very far from clean. The place where they took out the skim milk was a ghastly sight; walls and everything covered with a layer of dried skim milk, which must produce a bad lot of bacteria, and at the same time the question arose: "If all what we read in HOARD'S DAIRYMAN about dirt is true, how can a butter maker always have fine butter, under such circumstances, and if the butter maker or manager does not practice cleanliness, what must the patrons be?" Is then all our work to be clean and keep clean for nothing? And is all this talk about cleanliness humbug? To look at some creameries, our answer would be yes; but I do not believe we would find such ways of doings at Hoard's creamery; and as long as we practice dairying, we will try to keep things clean, even if our buildings are far from what they should be, if our pocket money would allow it.

SUBSCRIBER.

Nine times out of ten, any trouble with cream in regard to flavor or smell, comes from the wrong kind of bacteria growing in it. In the late summer, when pastures are dry, and nothing remains of the drinking places, but a mud hole with a little stagnant water in it, the cows will wade through the mud to get a little water, and also get rid of the flies. There is nothing that will cause trouble in the cream vat so quickly as a little dried mud from such a slough, getting into the pail of milk.

It starts a fermentation that is prolific in bad smells and off flavored butter. Cleanliness in the dairy is necessary, but it is not all. Look to the other end and see what kind of water your cows are getting; if their food is musty in any way, and if there are any spots or damp places round the stables that can form starting places for the kind of trouble you find in the cream pail. There is always a cause for such things, and the cause is often in the most unexpect ed place. If it is removed, your trouble will go with it.

There is always a relation between the weight of butter sold and the price, and when a poor butter maker gets half a cent above, the total cash returns frequently indicate one-half below.

RATION FOR A LEADVILLE (COLORADO) DAIRY.

Please give me a ration of the following for dairy cows: Bran, $23 per ton; corn chop, $24 per ton; flax meal, $2.25 per hundred; alfalfa hay $9.30 per ton; timothy hay, $14 per ton, and which would you advise, wet or dry bran? C. E. B.

Leadville, Col.

In the event that it is not practicable to chaff any of this hay, bran must be used to dilute or extend the corn chop, as that is too concentrated to be safely or profitably fed by itself. Subject to the proviso that some flax meal should be added, if necessary to keep the bowels in first-class order, we recommend as follows:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
20 lbs. alfalfa hay.....	18.32	2.20	7.92	.24
4 lbs bran.....	3.52	.50	1.54	.12
4 lbs. corn chop.....	3.56	.32	2.67	.17
Totals.....	25.40	3.02	12.13	.53

Cows should have a stable warm enough to exclude frost but with ventilation so as to insure pure air; and if given water not too cold (56° to 60°) twice daily, feed the bran and chop dry. This is much more cleanly than to feed sloppy messes.

If any cow should seem to want more feed, let her have all the hay she will eat up clean. This is the universal rule, except for those few cases of cows that will gorge themselves.

MILKING MACHINES.—COW PEA HAY.

I think it was about two years ago you had some interesting information about milking machines. I wonder if a good many others besides me may not be wishing to hear something more as to how these machines are getting on. I was especially interested in one reported to have been used for several months by a Mr. Hussey, of Indiana, I believe. This seemed to be a simple suction arrangement.

If you have data, please give me statement of food value (digestible) of cow pea hay. The information at my disposal only gives chemical analysis.

I find the DAIRYMAN invaluable. With my little dairy of seven cows, on five acres of land, it has enabled me to clear about $500, during the last year. But my neighbors do not care to subscribe. They say you are too far north to know anything about our cows, and methods, and feeds. W. T. L.

Williamstown, S. C.

We are sorry to say that the milking machine question is in the same condition that it was two years ago. There have been many reports of their successful use, but still they have not received the endorsement which it would seem would follow success in this line; nor have they been exhibited at fairs nor advertised in the dairy press,—conditions which would indicate a want of practical success in spite ot the good reports. It would thus seem that the milking machine is not yet a practical success.

Cow pea hay contains 89.3 per cent of dry matter and the following digestible nutrients:

	Per Cent.
Protein	10.8
Carbohydrates	38.6
Fat	1.1

FORMS OF CHEDDAR CHEESE.

What is the difference between full cream Twin cheese, American full cream, and Young America? Is it great difference in the making of these three kinds? How many pounds in American full cream, and how many in Young America? In your paper I have seen names of several kinds of cheese: Full cream Twin, American full cream, Young America, Limburger, Brick, Swiss, and Daisies, and all I know the making of is Swiss and Twin cheese. If you can, without too much trouble, I would like you to let me know the difference of the other sorts.

Pigeon Falls, Wis. J. L.

Young Americas, Twins, Daisies, etc., are different names for the same kind of cheese, but in different shape. An American Cheddar (full cream) is a large cheese weighing about sixty pounds. Twins are about one-half as high, but of the same diameter as the above. Young Americas are small Cheddars weighing about ten pounds. Daisies are like Twins only there are three instead of two in a box.

A WISCONSIN RATION.

Please give me a ration for milch cows, averaging 1,100 pounds each, mostly Durham and some Holstein grades. I have marsh hay at $6.00 per ton; fodder corn, field-cured, cut one-quarter inch lengths, at $8.00; oats, ground, $14.25; mangels, $.3.50; and can buy wheat bran at $14.00; oil meal at $25.00; cotton seed meal at $20.00.

Dane Co., Wis. O. F.

Cows of this size, with anything like fair dairy ability, and not too long in milk, will require pretty generous feeding. The following is as little as can be recommended, for a daily allowance, and, doubtless, might be profitably increased for some of the animals:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
10 lbs. marsh hay....	8.84	.24	2.99	.09
10 lbs. fodder corn...	7.10	.37	4.04	.12
20 lbs. mangels.....	1 82	.22	1.08	.02
4 lbs. oats.....	3.56	.37	1.89	.17
3 lbs. bran.....	2.64	.38	1.15	.09
2 lbs. cotton seed meal	1.84	.74	.34	.18
Totals.....	25.80	2.32	11.49	.67

As long as the mangels last there will be no necessity for using the oil meal. When they are gone, use one pound oil meal.

This ration costs at prices named 16¾ cents, and allows but a small margin for profit, unless one has good cows. It will, however, cost fully half this amount to keep the cows when not in milk, and then get no return whatever. Better keep on milking, even though the returns show no profit.

ANTI-ABORSIO.

Where can I get Anti-Aborsio spoken of by H. Van Dresser in the DAIRYMAN? D. I.

Misha Mokwa, Wis.

Consult the advertising columns of the DAIRYMAN, page 701. The manufacturer will supply all needed instructions for use.

TURNIPS FOR MANURE.

What is the analysis of common field turnips? Two years ago we had some turnips freeze, and consequently decayed partially before they were fed out; they were dumped in a pile on a field near the barn, and this season the field was plowed and sowed to millet. This spot where the turnips were, showed ten times the growth of forage that there was any where around it. There were two large brush heaps burnt on the field and those places showed a similar growth that would indicate potash.

Enfield, Mass. G. H. W.

Turnips contain but a small quantity of fertilizers, the average amount being between one and two-tenths of a per cent of nitrogen and 0.8 per cent of ash. They would, however, under the conditions named supply quite an amount of humus to the soil which would act by enabling the soil to hold more water, in a dry time, and at the same time set free some of the latent or locked up fertility of the soil. The above is a good illustration of the necessity of humus and its effect when supplied to the soil.

CAN A HORNLESS BREED OF CATTLE BE CAUSED BY DEHORNING.

Can the horns be bred off of cattle by breaking off the horns of calves, as soon as they appear, for a number of years and breeding from such as have been thus treated for a few generations. I believe it can be done but I have no authority for it.

Waterloo, S. C. J. H. W.

Like our correspondent we do not find any authority for believing that a hornless race of cattle can be bred by removing the horn artificially and we are also inclined to believe it to be impossible. The growth of an organ of the body is caused by something inherent in the body and the removal of the organ itself does not destroy that power. Lamb's tails have been clipped for many generations but the long tail still appears on the young sheep. The same is true of dog's ears, the spurs of game cocks and many other cases where from convenience or fashion parts of the animal body have been removed. In spite of constant removal, the next generation shows the organ in its full development and the operation is repeated with each generation.

Hornless cattle can be and are produced but it has been done by taking advantage of some sport without horns and selecting and breeding from the progeny, and even in such cases there is always a tendency to revert to the horned animal, unless the selection has been kept up sufficiently long to fix the type.

OLDENBURG CATTLE.

Please give us description and value of the Saxony cattle for milk, size and average weight for cows. P. & S.

Yale, Iowa.

There is no breed of cattle to which the title "Saxony" is applied and the only breed of cattle which seems to fill our correspondents request is that known as the "Oldenburg" with the following characteristics. The breed differs from the Friesian in showing a heavier head and stronger horns and narrower buttocks. In weight they approach the Holland breeds. The live weight of the cows will average about 1,200 pounds; oxen from 1,500 to 1,800 pounds. The udder of these cows is largely developed and the yield of milk considerable, reaching as much as 3,000 quarts a year, from well kept animals.

A VIRGINIA FEEDING PROBLEM.

Please formulate me the most economical ration for cows, Jersey grades, for milk. Clover hay, $13.00 per ton; bran, $16 per ton; g ound oats, $20.00 per ton; cotton seed meal, at $22.00 per ton; corn meal, $18.00 per ton; flax seed meal, $26.00 per ton; cotton seed hulls, at $5.00 per ton. Our dairymen are somewhat perplexed to get the right economic ration. I am feeding with excellent results my own family cows, the following: Bran, six pounds; corn meal, two pounds; oat meal, one and a half pounds; cotton seed meal, one pound and a half; clover hay, fifteen pounds. I presume it can be bettered for economy

Norfolk, Va. J. A.

The ration fed by our correspondent is "excellent" in every respect, and especially so for first-class dairy cows, but as intimated is somewhat expensive, costing fully twenty cents. About half of this is paid for the clover hay, and it is quite possible that some changes could be made whereby the cost would be reduced without materially reducing the efficiency of the ration for cows of only fair, average ability. For instance, we might take away the oats entirely and still have sufficient nutrients remain to fully tax the capacity of many cows. It is, of course, pure waste to feed a cow more than she can profitably use, just as it is unprofitable not to feed her to her full working capacity.

It is our judgment that for cows giving less than twenty pounds of milk per day the following would suffice:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
10 lbs. clover hay.....	8.47	.68	3.58	.17
5 lbs. hulls.....	4.45	.02	1.65	.09
5 lbs. bran.....	4.41	.63	1.93	.15
2 lbs. corn chop.....	1.78	.16	1.33	.09
2 lbs. C. S. meal.....	1.84	.74	.34	.18
Totals.....	20.95	2.23	8.83	.68

Cost 15¾ cents.

ANTISEPTIC DISCS FOR ABORTION.

There seems to be considerable uncertainty among dairymen regarding "anfiseptic discs" mentioned as a remedy to be used as an injection for abortion. There is no regular formula for these "discs." Each manufacturer uses his own recipe and the "discs" consequently vary widely in composition.

The following solution is used for injecting: Corrrosive sublimate, one dram; alcohol and glycerine, one ounce each; dissolve and add water, one gallon. Use for injecting and washing the parts. The above solution is very poisonous and should be kept in a wooden barrel, and out of the way of animals or children. A much safer mixture is a four per cent solution of creolin. In connection with the above a thorough disinfection and cleaning of the stall and burning of all infected matter should be performed, unless it is wished to find the use of injections a waste of time.

INFORMATION WANTED.

1. Have you tested your herd, by weighing the milk and the Babcock test, to find which were the poor cows?
2. How long did you test, and how many did you reject? (Give the whole number of the herd at the beginning of the test.)
3. Is it much trouble or expense to do this, and what plan did you pursue?
4. Have you ever taken a herd of common cows, placed a registered sire at their head. and so kept up the system, until you brought out of it a herd of grade cows?
5. What was the breed you selected, and how much more butter, cheese or milk did you get from the daughters than the original mothers?
6. Would you advise changing breeds, one after another, or breeding right along in the same line?
7. Have you ever bred the daughters back to their own sires, and if so, what was the effect on the health and dairy capacity of the grand daughters?

NOTE—We want as many short, brief answers to the foregoing, from as many different men as possible. Make the answer to each question short as is possible; simply state the facts, not opinions Do not worry about the style or grammar of your statement Answer each question by number, and state your experience.

1. Have tested my cows, by Babcock test, weighing milk after each milking and making weekly tests and calculations therefrom.

2. Time of continued weekly test: Through full milk giving period. Have six grades, two Jerseys and four Guernseys. Could not reject any.

3. I do not consider it much expense to make these tests, counting the value received therefrom. After each milking, it was thoroughly stirred and samples taken each time and put into a glass receptacle, for the purpose, taking care to have each cow's milk separate by using a number for cow and having a corresponding number for glass can. Was very careful in taking test sample, so for accuracy used two samples for every cow, in the test bottles, until I found it was not necessary.

4. Have raised all my cows, except one. Bred their dams to best bred bulls of their breed—Jersey or Guernsey—in the vicinity, and produced such grades as I have. Have had a registered Guernsey bull at the head of lot one year. I have a preference for Guernseys. I might say that the Guernsey cows I have are bred Gurensey for three generations. The Jerseys are bred only two generations. These I do not cross with the Guernsey.

5. Have found the average gain in the last generation, to be nearly ten per cent in butter.

6. I would never advise any one to change from one breed to another more than once, and then only for the purpose the cow is intended, keeping the breed absolutely pure.

7. Have never bred daughters back to their sires. Besides the above I might say: Two years have passed since I commenced to use a No. 1 DeLaval "Baby" separator, turning the product of these six cows into butter, which my butter maker (my wife) sells in the local market to private families at twenty-five cents a pound the year round.

Mishawaka, Ind. M. E. L.

1. Have been weighing the milk for over three years. Have tested the entire herd with Babcock test twice.

2. Rejected one out of nine, on quantity, after about one and three-fourths years' weighing.

3. Very little trouble. Have an ordinary spring scale hung up just outside the inner entrance to the cow stable. As each cow is finished, the milker steps to the entrance, hangs the pail on the hook of the scale a moment, pours the milk into extra pails sitting handy by, and goes back to work. Ordinarily, each milker enters up his weighings only after finishing milking his cows, deducting in each instance the known weight of the pail. The record is entered in pencil in a cheap blank book kept in a shallow pocket, made by tacking a piece of canvas to the partition wall right by the scale. The several cows' records are kept in horizontal lines opposite their names, and at the end of the week the total of each cow is taken off and filed away for future reference.

4. Yes, grade Jerseys, using a pure bred Jersey sire. Cannot say that the younger stock, raised in this way, are any better than their dams, who were only fairly good. Too much pure bred Jersey stock is raised and sold that has little but its name to recommend it. Probably the same is true of other dairy breed.

5. Answered above.

6. I would recommend sticking to the same breed or family. I should not regard changing from Jersey to Guernsey or vice versa as a change of breed in a broad sense—not such a departure as changing from the Channel Islands family to Holstein or one of the so-called "general-purpose" breed such as the Red Polled cattle.

7. No. EUGENE E. STEVENS.

Lake Co. Ohio

1. Yes.

2. In 1897 I tested occasionally; in 1898 I weighed every milking and tested about twice a month. Eight cows; rejected two.

3. It takes a few minutes longer each milking; the expense is trifling. I have my scales and tally board hanging in the stable near the door, where I pass to empty milk.

4. Yes.

5. Jerseys. Daughters have not come to maturity.

6. Breed in the same line.

7. Yes, but they have not calved yet.

The first cow to go after the test, was the only registered Jersey cow I had. I milked her three years. She had a fine, large udder and was called a splendid cow by all that knew her. I bought her for a foundation cow, took extra care of her, fed her all she would eat of the best I could get and it was a hard pill to swallow to send her to the block, but she would not pay her board.

The next to go was her daughter, which came soon after I got her; claimed to be from a full blood Jersey sire. I milked the heifer two years; she had to go. I have another heifer from the old cow and my sire, that promises well.

After reading HOARD'S DAIRYMAN a while, I bought a grade Jersey cow for fifty dollars. Folks called me a fool (to my back) for paying such a price for that cow. I could get cows that showed more Jersey for half the money. Her test according to the scales and Babcock, was 399.6 pounds butter; she ran in the woods in the summer without grain. Had two heifer calves in the time. Has just dropped another. She has had three pounds of bran a day this summer and will beat her last year's record. Wouldn't I have been a fool to have taken a 200-pound cow as a gift instead of buying this one, my choice of a herd of fifty? Thanks to the DAIRYMAN for pointers. Registered papers won't hurt any cow, but we must have workers in the dairy, or go under. E. W. KELLOGG.

Lincoln Co, Wis.

1 Yes.

2. Tested 8 months. Made a test of each cow twice a month. Number of herd, 24; rejected, 6.

3. Some trouble and expense. Used composite test; think its bett er than testing each day. More than made up for time and expense.

4. For four years.

5. Jerseys. Record shows a gain of a pound and seven-eighths butter over original daughters.

6. Yes; but not one after the other exactly. Have made two crosses on Jersey grades with Holstein bulls. Intend using Jersey bull on last cross.

7. No.

Some Special-Purpose Ideas and Facts.

ED. HOARD'S DAIRYMAN:—Attendance at fairs this fall tends to convince one that the beef cattle breeders are in the saddle once more; and true enough they are enjoying a boom in high prices just now. The noise they are making has its bearing upon the masses of stock growers who are being induced to bend every energy toward the production of beef. Some are sacrificing their dairy cows in two ways. First, by selling them off at fair prices to butchers and purchasing beef types for future breeding and chasing the same old delusion of getting butter and beef, but bound to spoil one or both types. The second class are putting beef sires into dairy herds, thereby making a mess of what may have been gained in improvement toward dairy types.

It is only the occasional breeder who stands firm to the one idea of beef, and beef only. It is he that is putting in the sheckles from the double-purpose fellow who is always waiting for an opportunity to rake in money with both hands, by making beef and butter out of the same cow and feed.

Say, boys, you can't blow hot and cold nor can you eat your cake and keep it at the same time.

We have heard of people who could put a quart into a pint bottle, but the statement always sounded a little on the Munchausen order and to be taken with a few grains of salt. There are some breeders of dairy cattle who have need to squeeze a quart of their milk into a pint's capacity, yet they are not flimsy enough in the head to claim that their cattle are beef types, simply because a whole cow will give a little short of a barrel of milk per day.

Occasionally one fellow bobs up who has carried on dairying after the general-purpose idea, who has escaped the sheriff or not availed himself of the bankrupt act. Circumstances have favored him and he would naturally succeed at most anything he might "tackle." He has made some money by tact and economy and is to be respected for it. Nine out of ten men with the same cows would break up, running the gauntlet on the same lines. Take it as a rule each of the nine will favor either beef or butter and just as naturally as water runs down hill, will drift one way or the other to the utter destruction of the opposite type.

The main reason that so many favor the dual-purpose animal is because they have not given both kinds a fair trial singly, hence are not unbiased enough to write or speak rationally upon the merits of either.

Some years ago the writer arrived at the same thing we are writing about and it was impossible to keep from purchasing a sire bred deep into beef lines, and did so, and it only took three generations of breeding to utterly destroy our female progeny as useful dairy cattle, and as beef cattle went down and down in price, we soon let loose the whole lot and began again with the Jersey cow, breeding for butter alone, and the only change we have made since has been for more butter, and if we seek for further change it will be for the same commodity, but always keeping quality right to the front.

It has always seemed strange that breeders cannot argue wisely with themselves, if not with men, that every time they cross their types that the dam or sire transmits fifty per cent either way as the case may be.

If a dairy type cow is crossed with a beef type bull it is well known that her owner is breeding for beef and fifty per cent of that offspring must naturally tend toward the sire. We do not advocate that it will cut down in its dairy tendency fifty per cent because all cows are supposed to give *some milk*; some more, some less. The merits of the case rest here. If the dam has been bred for butter for generations and sire for beef the same period, with same devotion toward each type, the sire is naturally most prepotent and casts at least twenty-five per cent more of his type than the dam can possibly transmit. Thus but a few generations of such breeding is necessary to ruin a herd of dairy cows; yet the progeny resulting from such unwise mating does not come anywhere as near establishing a perfect beef animal as it has in ruining the dairy type.

On the other hand, the breeder of beef cattle who undertakes to drift dairy-ways, uses his best wisdom and buys a dairy type sire, impressed with the idea that the sire is half the herd and by careful selection in a few years becomes the herd himself, branding it perpetually with each generation with a likeness of his own.

Neutral lines are difficult to establish and very hard to maintain. We doubt sometimes if there is such a thing as neutrality. Men claim to be neutral in politics yet we doubt their sincerity, for their talk soon shows a leaning toward one side or other. Such patriots as these are not sought after when governmental policies are to be inaugurated, but rather men who are positive in their purpose and ideas, singled out for one high devoted aim in life. We believe in the man who breeds cattle for a special-purpose and is or has made it a life time study. That man is established.

* * *

Beef has not been selling here at any better prices than dairy products. The unusual demand for cream, starting in as early as latter part of April, kept up prices on butter to a very satisfactory point. The price on a good article of butter did not reach below eighteen cents and from that to twenty-five cents, to September first.

One creamery has been selling its entire output ranging from twenty cents up to thirty cents to date, and will pay its patrons over twenty-five cents net for fat, October fifteenth.

They claim, too, that they are short each week on contracts. Aside from good prices our dairymen have had a fine season of pasture. Unlike most sections, there has been no great shortage in the growth of grass, and those who did complain were in that predicament because they were overstocked but supplemented with plenty of fodder corn.

The only difficulty we encountered was that on our natural pastures the growth was so rank, that when midsummer appeared the grass matured leaving a large quantity of dead blades to be consumed by our cows while pasturing. The cows relish such pasture, yet this kind of forage does not keep up a heavy flow of milk, that is, does not make butter fat.

While they were allowed full access to these pastures, they would not eat fodder to amount to anything, though it was of the best in quality. To overcome the difficulty a heavier grain ration was fed, mostly bran. The quality of butter made from these conditions is always first-class right through the midsummer months, and can be put into market in solid square blocks without ice.

Now to make a comparison with one of our beef fellows. He said to me the other day: "I got twenty-five dollars for a calf that run with the cow since last April, about six months time, and did not have to milk twice a day to get it either." Well, I said, that's pretty good, but let's see what your neighbor says he got out of his best cow—one hundred and thirty-five gallons of cream at forty-seven cents per gallon net, equal to sixty-three dollars and forty-five cents, one heifer calf reared on skim-milk worth twenty-five dollars, besides skim milk left for table use, making a total of eigthy-eight dollars and forty-five cents.

Aside from that his cow is good for one pound of butter each day for at least four

"Uneasy Lies the Head That Wears a Crown."

But such are not the only uneasy heads. Overworked housewives, harassed business men, anxious teachers, ambitious students—all ages and both sexes are uneasy with aches, pains, impure blood, disordered stomachs, deranged kidneys and liver. For all such, Hood's Sarsaparilla is the effective and faultless cure. It infuses fresh life and health into all parts of the body through purified, vitalized and enriched blood. Try it.

Hood's Sarsaparilla
Never Disappoints

Hood's Pills cure liver ills; the non-irritating and only cathartic to take with Hood's Sarsaparilla.

Farm Wagon only $21.95.

In order to introduce their Low Metal Wheels with Wide Tires, the Empire Manufacturing Company, Quincy, Ill., have placed upon the market a Farmers Handy Wagon that is only 25 inches high, fitted with 24 and 30 inch wheels with 4 inch tire, and sold for only $21.95.

This wagon is made of the best material throughout, and really costs but a trifle more than a set of new wheels, and fully guaranteed for one year. Catalogue giving a full description will be mailed upon application by the Empire Manufacturing Co., Quincy, Ill., who also will furnish metal wheels at low prices made any size and width of tire to fit any axle.

Finer Flavor, better quality, better price; that's what results from the use of the Champion Milk Cooler–Aerator in your dairy.

Our book about it free.

CHAMPION MILK COOLER COMPANY,
67 Main St., Cortland, N. Y.

months yet to come, while your beef cow will soon shrink up and dry off.

Some how or other when ever I get into a discussion of dairy cattle vs. an all-purpose breed I am reminded of the story about the great show clown, Dan Rice, when he was called a fool by one of his auditors, stopped short and said, "Do you know the difference between you and me?"

"No," said the outsider, "what is it?"

"Why," said Dan, "you are a fool for the want of sense (cents) and I am one because I am paid for it."

Some of us who are wedded to the special dairy cow may be fools, but if we are, it is simply because we are paid for it.

Ohio. GEO. E. SCOTT.

The Virginia State Fair.

ED. HOARD'S DAIRYMAN: — Thinking you would like to have a line from Old Virginia State Fair held here this week, and especially when we had some very fine specimens of dairy cattle, I send you a few items.

In the first place whilst our State Fair cannot move in the same class as your northwestern fairs, yet there is always a great deal of enthusiasm and the energy of the officers make it a success.

This year the big attraction in stock was the magnificent Jerseys from Mr. Vanderbilts "Biltmore Farms." It is the expressed intention of the proprietor to run these farms as an aid and help for the Southern states, hence, Jersey cattle are the main attraction. From the large herd of some 250 animals, a carload was selected, "Golden Lad" blood largely represented. Mr Gentry visited the Islands and bought the best money could buy. This strain is simply wonderful in richness. The cows are reported to test with the Babcock 6½% butter fat, on the average. The cow "Golden Ova" Imp. 127228, sired by Golden Lad, is the finest Jersey it has ever been my luck to see. (I believe you have had a cut of her.) She is made right. It would be very hard to pick a fault with her. She is the perfection looked for but scarcely expected to see by the student of HOARD'S DAIRYMAN; has all the wedge shapes; rare to see a cow so sharply perfect in all these points, whilst her business end is built just right; her bag, large, soft, well placed, well up behind and in front; four well placed teats, milk veins not as large as many large milkers but good size and length. Head is sweetness itself. If I was going to make my ideal of a Jersey cow I would simply point to "Golden Ova" unless I could have her skin a more golden color—that seems to me the only lack.

Her son, Golden Lad's Successor, by her sire Golden Lad, is herself masculined. He is bound to make a show for himself. At first I was inclined to doubt the 6½% butter fat on account of lack of golden skin, but I was assured that it can be substantiated. A dozen fine heifers along this line of breeding testified to their outstanding merits and evidently will repay us to make a visit to Biltmore. Mr. Benninger's show of Holsteins from Pennslyvania hardly were creditable to the breed. But Messrs. Lindsay & Son, of Elizabeth, N. J., had some good Ayrshires, and Mr. Worden's Devons from Ulysses, Pa., made a very creditable show for the dairy. The Hill Top Farm, of Staunton, Va., had some good working Jerseys on exhibition. I. C. W.

Cedar Hill Farm Notes.

A Butter Score—Winter Preparations—Rape as a Cow Feed—Culling the Herd—Capons.

ED. HOARD'S DAIRYMAN:—After being away from the land of skilled butter makers for some years, we thought we would like to know just where we were at, so we packed a pail of butter and sent it to the dairy exhibit at Springfield, during the state fair, to have it passed on by an expert. In time we received the score card; we were cut two and one-half points on flavor, one-half point on grain, perfect on color and salt, making a total score of 97 points. As near as we can learn to date, there were 1,400 entries, and our score let us in with nine others on pro rata purse of $50.

We won first on county exhibit, so we felt that our hand has not lost its cunning from our stay in the south.

Fall is again with us, and we are busy getting things in shape for cold weather. We will use plenty of tarred paper both in cow barn and hen houses. We find it better than any other thing to keep out winds and frost.

We will build a barn to accomodate thirty cows, so that all of our stock may have comfortable quarters. Hay and fodder will be scarce before spring; we have our oat crop in sheaf under roof and during our leisure it will be run through cutter, together with corn fodder. We hope in this way to economize our hay crop, and at the same time keep cows well up in milk flow.

Our past summer's experince with rape as a cow food was so satisfactory that the coming summer we shall devote all lands possible to it; especially will we sow among growing corn that is intended for ensilage, so when corn is removed we can have pasture. Frosts do not injure the plants; all kinds of farm stock are fond of it, and it yields a great amount of food per acre.

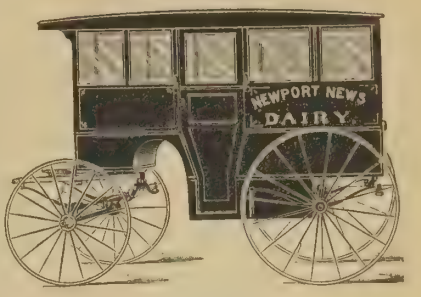
We have now reached a point in our herd work that we can begin culling; and with what rejoicing my boys see some of the unprofitable ones go, they are so thoroughly posted with scales, daily milk records and Babcock test, and amount of food consumed, that they know every cow that does not yield a return over cost of keep.

We, as breeders of Jersey cattle, have one rule that would be a great help to many other breeders in keeping up the reputation of their herds; no matter how rich the blood of any cow, if she does not pay us a profit at the pail, we consign her to the butcher instead of selling her to someone as a family cow, or as a part of a herd. All of our bull calves are killed at once; we have none for sale at all. All heifer calves are kept until they are in milk so that we can thoroughly test them. In this way our reputation is not injured by placing poor cows on the market.

We will caponize 100 or more cockerels this week, as an experiment, and if it proves profitable, will go into the business quite largely. The cockerel problem is one that confronts many in the poultry business. They are at all times full of mischief, eat a vast amount of food, and the older and larger they get the less they are worth. In our case we wish to have our table supplied from the male end of our poultry yard, but don't like roosters worth $1.50 per dozen, any better than any other good dairyman.

BUFF JERSEY.

Skim Milk for Hogs.



Skim milk should always be used when it is available. It is not only a good flesh producer in itself, but it also makes the ordinary grain feeds more digestible and so adds greatly to their value. While skim milk alone is rarely profitable, from twenty to forty pounds being required to make a pound of meat, when mixed with grain in the proportion of three pounds or less of milk to each pound of grain its value is greatly increased. In a test reported by C. P. Goodrich one bushel of corn produced ten pounds of pork, and one hundred pounds of skim milk produced five pounds of pork, when fed separately. When fed together, however, the mixture produced eighteen pounds of meat, an increase of three pounds due to the mixing. In this case one hundred pounds of skim milk took the place of 44.8 pounds of corn. If the corn was worth twenty-five cents a bushel, the milk was worth 19.6 cents per one hundred pounds; if the corn was worth forty cents, the milk was worth 31.4 cents. Extended tests in the feeding of skim milk have been made at the Utah Station and are these: "The hogs fed on the milk and grain ration made much more rapid gains than either those fed on milk alone or on grain alone. The time required to make one hundred pounds of gain was seventy-nine days for the hogs fed on milk and grain, one hundred and sixteen days for those fed on grain alone, and one hundred and forty-seven days when the feed was milk alone.

The milk and grain lots required 2.58 pounds of digestible matter, the milk fed lots, 2.85 pounds, and the grain fed lots, 3.19 pounds to make one pound of gain in live weight." In this case one hundred pounds of skim milk took the place of 23.2 pounds of grain in the mixture. Work at other stations has given very similar results and has demonstrated that when not more than four pounds of skim milk is used with each pound of grain the milk is worth from fifteen to thirty cents per hundred pounds. The younger and smaller the hogs the higher is the value of milk. For full grown and aged animals it is of less value. It may be taken as a safe rule that it is profitable to pay at least fifteen cents per one hundred pounds of all the skim milk needed to make four times the weight of the grain fed, and where it is impossible to secure enough for all the hogs the available supply should be given to those pigs nearest the weaning age and to sows suckling pigs.—*Blooded Stock.*

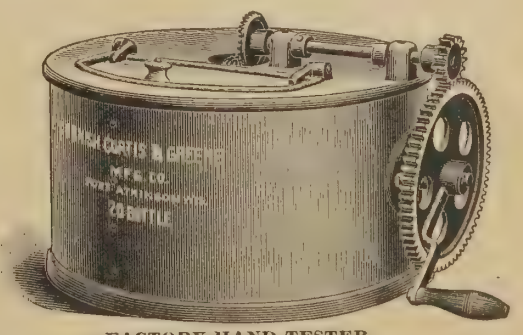
Be Careful



FARM TESTER.

To read article on page 488, issue of Aug 4, HOARD'S DAIRYMAN, regarding the Use of Babcock Testers in Cheese Factories.

We were the first manufacturers to make a tester in which to test milk after the method devised by Dr. Babcock, and we have always retained the first place in the list of manufacturers. The Farm Style, Factory Hand Style or Factory Motor Tester are the best made. Full descriptive catalogue, with directions for operating, free.

MOTOR TESTER.

FACTORY HAND TESTER.

CORNISH, CURTIS & GREENE MFG. CO., Fort Atkinson, Wis.

Agents for DE LAVAL ALPHA SEPARATORS.

Inventors, Manufacturers and Dealers in Everything Pertaining to Butter and Cheese Making.

A PHILADELPHIA oleo man has gone to prison for six months and pays a fine of $1,500 for the offense of removing the marks from a package of oleo, so that it could be sold as butter. It is reported that $8,000 was offered as compensation,

The mills of justice are frequently very slow in producing results but in this case they have "ground exceeding fine" and it will be interesting to note if the Chicago oleo men will continue to guarantee protection to their handlers of oleo who sell it for butter

Six months in jail is not a pleasent thing to look forward to especially when the guaranty does not guarantee.

THE SKIM MILK QUESTION.

The dairy school is contemplating the addition of the necessary apparatus for the manufacture of dried curd. This is a by-product of skim milk, and is used largely in the manufacture of paper. A number of the more progressive creameries are utilizing their skim milk in this manner and find it more profitable than any other way of handling this by-product of butter making.—*Pennsylvania Experiment Station Bulletin.*

It would seem that there is much danger of an infant industry being overdone, and a promising source of income receiving a serious set back.

The present outlook is that there is danger of the dried curd business being carried to such an extent as to over supply the market, which will of course, cause a fall in prices below the profitable point, with the usual result of loss to those dairymen, who have put in machinery to manufacture this product, but have not yet secured a regular market for the same.

Treating skim milk in this manner is only obtaining a crude low priced product at best, and not by any means putting it to its best use, which is as a human food.

There is a chance in this line for the experiment stations to do some really valuable work. There is an inexhaustible amount of skim milk to be obtained at low figures, and the little that has been done by foreign chemists in this line has made little if any impression on an exceedingly important subject.

We hear a great deal upon the waste of corn stalks, and many plans and machines are being tried to see if the waste cannot be prevented.

An equal amount of work on the skim milk question cannot but produce valuable results. The field is great and the laborers few.

From an Arkansas Dairyman.

Building a Silo.

ED. HOARD'S DAIRYMAN:—For the benefit of others I will record my experience in building my silo. I commenced to keep cows three years ago,—commenced with three natives, on a rented place.

January 1st, 1898, I purchased a 220-acre farm, assuming a mortgage for $8,500. In February, I built a cow barn 30×34, two stories high, with feed alleys, walk ways, and twenty-seven stalls, with gutters behind cows. In the fall, I built dairy rooms (two) 12×12, concrete cement floors, put down seventy feet, two inch tubular well, force pump, with water connection in both rooms and cow barn.

I purchased from the herd of George Campbell Brown, Spring Hill, Iowa, a thoroughbred bull calf, $65, at three months old, with nine grades at the same time.

I have read HOARD'S DAIRYMAN eagerly for three years, and by its teachings I purchased in spring, 1899, 300-pound latest patent Sharples cream separator, with forty gallon, six-sided, Fennor churn.

In September, I went to woods and cut and hauled to saw mill, enough yellow cypress to make 200 staves, 2×6; 100 pieces, 10 feet long, and 100 pieces, 14 feet long; had them dressed on one side, and both edges, and sized. In making the joint, I put up one fourteen-foot stave, and on top I put ten-foot staves, reversing the lengths every time. I also put up in the circle four pieces 6×6×26, and roofed on them; had my hoop made from ⅝-inch round iron, in four sections, threads eight inches on each end, and extra heavy washers and nuts. I sawed in one end of each stave, and used band iron 1-16×2×6 and it makes nice joint.

The foundation is put down as follows: Excavated to depth of six inches; used 300 brick and one barrel of cement to stand staves on, two layers of brick cemented together in right circle. I erected the silo as per illustration found in HOARD'S DAIRYMAN; am going to put silage on the earth this season and try it and will back up outside and inside with cement.

Have purchased a two horse St. Albans Tread and a ten inch Leslie St. Albans Shedder with thirty feet of carrier; will commence to fill on the 9th inst.

Have twenty-one cows in milk and have secured from Ewell farm, a young bull, Tormentor strain. When I get the silo filled will let you hear from me again.

In 1898, I paid on mortgage assumed $5,200, but as yet have not been able to pay a dollar in '99, as first crop of Irish potatoes showed a loss, and we have yet to harvest our cotton crop and second crop of potatoes.

Have ten acres of corn nicely shocked and ten acres planted in July, yet in fine state to put in silo. W. A. JOHNSON.

Ark.

Notes From the Sigworth Farm.

A Dairy and Truck Farm—A New York Fair.

ED. HOARD'S DAIRYMAN:—Not long since some one in the DAIRYMAN wondered if trucking and dairying could not be profitably worked together. If you will allow me a little space I will tell my brother farmers how I run a truck farm in connection with a ten cow dairy.

We are located six miles from Franklin a city of 10,000 people and the county seat of Venango county, Pa., and nine miles from Oil City of 15,000; the latter city claims to be the greatest manufacturing city of its size in the United States, while at Franklin is located the second largest refinery in the world. The country for miles around those cities is broken and hilly and mostly devoted to producing oil, in fact in the vicinity of Franklin is the only heavy or lubricating oil territory in existence.

This oil is used for greasing machinery, in its crude state, and sells for five times the price of common oil. So our market is never overstocked with good produce and although we make every thing secondary to our Jersey cows, we aim to raise everything our customers need and of good quality and honest weight and measure, and not to have the big potatoes and nicest apples on top of the measure.

A look at my delivery wagon as I start to market on a spring morning would reveal onions, lettuce, radishes, salsify, asparagus, rhubarb, parsnips, potatoes, beets, butter, eggs, butter-milk (as much as twenty gallons of the latter sometimes), smear-case, milk, cream, etc., and most of my load contracted for by regular customers. While by putting boxes round and working it properly (we have 300 hills) we are in the market two week ahead with our rhubarb, and sell $25 to $30 worth per year, and from now until May sell from eight to ten dozen jelly glasses of grated horse-radish per week. The two latter articles we sell mostly through the stores.

We raise all kinds of berries, currants and gooseberries. The Almighty in his infinite wisdom probably could have made a better berry than the strawberry; but I don't think he did, and then it is equally as well at home in the sunny south, or blustering north, and is as easy to grow as a bed of onions or lettuce; and yet how small a proportion of our farmers have any berries, only what wild ones the wife and girls pick out. Bed is so large that we can eat all we want at all times and in all ways, and wife need not yell at us to get out the berry patch.

We used our first mess May 28th, and for four weeks used at least two quarts per day, per kid and adult, making lots of meals on berries, bread and butter, and thus saving a lot of hot work for the women; and we sold fifteen bushels, which, clear of picking, averaged $1.50 per bushel.

I had intended to say a little something about dairying, but want to tell of our Venango County fair, which was held at Oil City, and if there is not enough cow in it for the editor, put it in the great receptacle for the manuscript of budding authors.

To call it an agricultural fair, would be a misnomer, as agriculture cut but a small figure, and of the 35,000 persons in attendance, not one-third paid a visit to the agricultural part. Our county contains some fine herds of dairy cows, and perhaps fifteen creameries and there was not a pound of butter or loaf of bread, and but very little other stuff from the homes of our farmers, on exhibition. There were two samples of corn, six of potatoes, four squash, four pumpkins, and no other garden stuff. Of apples there was a full exhibit; and excepting trotters, no horses of any account, a few cattle, but lots of sheep and hogs.

But the sports claimed the trotting and running races were good; they had all kinds of games, from the catch penny to a huge wheel of fortune, and of shows you could take your choice, from "for men only" to the great moral pantomine of Christ's Suffering. Who is to blame for this? It seems a purely agricultural show will not draw a crowd, and the management must resort to any expedient to get the most twenty-five cents.

Wyattville, Pa. O. C. S.

Our Special Elgin Letter.

ED. HOARD'S DAIRYMAN:—The offering of butter on Monday's Elgin Board of Trade aggregated but 2,580 pounds but not a bid had been received when the call closed.

The quotation committee declared the market steady at 23½ cents.

The sales for the corresponding week of the three preceding years were as follows:

Oct. 17, '98, 7,500 lbs. of butter sold at 21½c.
Oct. 18, '97, 9,960 lbs. of butter sold at 22c.
Oct. 19, '96, 67,260 lbs. of butter sold at 20c.

The New York market Monday was reported steady at 24 cents. H. C. B.

Elgin, Ill., Oct. 16, 1899.

Memory-Points About Singer Sewing-Machines.

SOLD ON INSTALMENTS. . .
OLD MACHINES EXCHANGED.

We make but one grade of product, admitted to be the best; hence attempts at imitation.

We deal directly with the people, through our own employees all over the world, selling 800,000 machines annually. We do not sell to dealers nor through department stores.

If You Buy a Singer

You get an up-to-date machine, built on honor, to wear a lifetime.

You get it for the lowest price at which such a machine can be furnished.

You will receive careful instruction from a competent teacher at your home.

You can obtain necessary accessories direct from the Company's offices.

You will get prompt attention in any part of the world; our offices are everywhere, and we give careful attention to all customers, no matter where their machines may have been purchased.

You will be dealing with the leading sewing-machine manufacturers in the world, having an unequaled experience and an unrivaled reputation to maintain—the strongest guarantees of excellence and fair dealing.

The Singer Manufacturing Co.

Salesrooms in Every City in the World.

DAIRY MARKETS.

ELGIN, Ill., Oct. 16—Butter—Forty tubs offered; no sales; committee reported steady, 23½c.

CHICAGO, Ill., Oct. 16.—Butter—Creamery, extra, 22c; firsts, 19@20c; seconds, 15½@16½c; dairies, selections, 19c; No. 1, 16c; No. 15c; extra ladle, 14½@15c.

Cheese—Full cream, Twins, new, good to choice, 11¾@12c; Young America, 12@12¼c; Swiss, 10@13c; Limburger, 10@11½c; Bricks, 10@12c.

Eggs—City candled, fresh, cases included 16½c,

Bran—Steady, but quiet, and sold at $13 in sacks on track, and at $12 in bulk, through billed.

Middlings—Sold f. o. b. at $12.50 per ton.

Cattle—The best native and range cattle ruled steady, while other grades were weak to 10c lower. The best cattle received here, 30 head of 1,515-lb. corn-fed Wyoming polled Angus steers, sold at $6.70. The next highest was $6.60, with the bulk of native steers at $5.50@6.20; corn-fed Western averaging 1,087@1,625 lbs. sold at $4.75@6.30; grass Western steers $3.85@5; Western cows and heifers, $3.25@4.25; grass Texas, $3.60@4.30 for steers and $2.65@3.25 for bulls and cows. Good native canning cows sold at $2.50@2.80: fat cows, $3@3.50: good to choice heifers, $3.50@4.75; bulls, $2.50@4.25; stags, $3.50@5.25; calves, $4.50@7.15, and feeding cattle at $3.10@4.70.

MILWAUKEE, Wis., Oct. 16—Butter—Creamery—Fancy prints, per lb., 23½c; extras, 23½c; firsts, 22@23c; seconds, 20@21c; imitations, 19@20c. Dalry, selections, 18@20c; ladles, 15@16c. Market unchanged and quiet with an ample supply and a slow trade.

Cheese—American full cream, new, choice to fancy, 11½@12½c. Brick, 11½@12c Limburger, new, choice, per lb., 11@11½c. Swiss, drum, 12½@13c; block, 12½@13c; No. 2, 10½@11c. Market firm; receipts 1,050 lbs.

Eggs—Fresh, per doz., 16½c, loss-off cases returned. Market quiet and easy; receipts 294 cases.

FOND DU LAC, Wis., Oct. 16—Cheese—Offerings 565 Twins, 730 Daisies; market steady; Twins, 11¾c; Daisies, 12⅛c.

MUSCODA, Wis., Oct 16—Cheese—Offerings today, 1,065 boxes. Market firm; locals, 11½c; carlots, 11⅝c.

BRILLION, Wis., Oct. 13.—On the Brillion dairy market to-day 1,658 boxes of Daisies were sold at 11½c; 800 boxes Flats at 11½c; 625 boxes Young Americas at 11¾c.

SHEBOYGAN FALLS, Wis., Oct. 11.—Sixteen factories offered 1,298 boxes of cheese on the Call Board to-day. The market opened quiet, with bids of 11½c. on all lots. Finally one bid was raised. and then another, creating quite a little strife on a few lots. Sales 145 cases of Young Americas at 12c.; 175 at 11c; 76 Twins at 11¾c.; 140 Daisies at 12¼c.; 175 at 11⅞c., and 100 at 11¾c.

MANITOWOC, Wis., Oct. 11.—Offers of cheese today at Dairy Board of Trade were: 750 boxes of Daisies, 195 boxes of Twins, 650 boxes of Young Americas. All offerings sold at 11¾ c.

HORTONVILLE, Wis., Oct. 5.—Offerings were 334 Cheddars and 726 Twins. Sales: 332 Cheddars at 11⅞c; and 656 Twins at 11⅞c. Ruling price: Cheddars 11⅞c; Twins, 11⅞c. Market active.

PLYMOUTH, Wis., Oct. 10—Cheese—Sales today, 850 Twins at 11⅞c; 380 Twins at 12c, and 1,200 Americans at 11⅞c.

HILBERT, Wis., Oct. 7—Cheese—The sales today were 509 cases Young Americas at 12c.

APPLETON, Wis., Oct. 5—Cheese—The offerings were all sold as follows: 215 Cheddars at 11⅞c; 182 Twins at 11⅞c, and 50 at 12c. Market active.

NEW YORK, Oct. 16.—Butter—Creamery, Western extras, 24c: firsts, 22@23c; state extras, 24c; firsts, 22@23c; state dairy, half-firkin tubs, 22c: receipts, 7,589 packages; prices steady; firsts in good supply.

Cheese—Firm at 11¾@12c for large and small white fancy, and 12@12¼c for colored fancy, large, and 12½@12¾c for small; receipts 2,559 boxes.

Eggs—Quiet at 20½@21c for best state and Pennsylvania; receipts, 9,025 cases.

PHILADELPHIA Pa., Oct. 16.—Butter—Market quiet, but offerings of fancy goods were small, and prices ruled steady; solid-packed creamery, extra, 24c; firsts, 23c; prints, fancy, wholesale, 24c; jobbing, 25@28c.

Eggs—There was a fair demand for fine fresh stock, and prices ruled steady, with small supplies; Pennsylvania and other nearby, fresh, 19c; Western choice, fresh, in free cases, loss off, 18½@19c; fair to good, 17@18c; ice house, 17@18c.

OGDENSBURG, N. Y., Oct. 9.—There were no

sales of cheese on the Board, but on the street 1,821 boxes were sold at 11½c.

FULTON, N. Y., Oct. 9.—To-day 19 factories were represented with 1,130 boxes of cheese. Large sold at 11½c and small at 11¾c.

CANTON, N. Y., Oct. 9.—There were 1,909 boxes of cheese and 828 tubs of butter offered here. There were sales of cheese at 12c, and of butter at 23½c.

WATERTOWN, N Y., Oct. 9.—Cheese—The market was firm. All held for 12c for both large and small. About 1,000 large were sold at 11¾c, while small sold freely at 11¾@12c.

NORWICH, N. Y., Oct. 9.—The sales of cheese were: Small colored creams, 375 boxes at 12c, and 460 boxes at 12¼c; small white creams, 100 boxes at 12c; skims, 500 boxes at from 9½@10½c. There were 40 packages of creamery butter sold at 23c; dairy butter sold at from 21@22c.

BOONEVILLE, N. Y., Oct. 8.—Cheese—The market here on Friday was strong. There were 6,360 boxes sold at 11¾@12½c.

LITTLE FALLS, N. Y., Oct. 9.—Cheese—The market made another stride upwards, and salesmen found no trouble in securing 12c. Most factories are now making very light quantities, and the majority of them will be closed for the season by November 1. The sales to-day are 5,735 boxes, all going at 12c, except 120 at 11½c, and 200 on private terms.

UTICA, N. Y., Oct. 9—Cheese—The cheese market today, showed another advance. This is the first time in five years that cheese has been as high at this stage in the season. The sales aggregated 8,030 boxes, mostly large sizes. Large sizes sold at 11½@11¾c, the former price ruling, while small sizes brought 12@12¼c, the lower price ruling.

The transactions on Oct. 12, 1897, were 8,423 boxes with 8½c as the ruling price. The transactions on Oct. 11, 1898, were 7,206 boxes with 8c as the ruling price.

Butter—The butter market, today, was higher for creamery, as a rule, than last week. The sales were: 16 packages at 22c; 8 packages at 23¼c; 85 packages at 24c; 18 crates of prints at 25c.

BALTIMORE, Md., Oct 16.—Butter—Market firm; creamery separator, extra, 25@26c; extra first, 24c; creamery first, 23c; creamery imitation, extra, 19@20c; ladle extra, 17@18c; Western store-packed, 13½@14c.

Eggs—Market firm; strictly fresh stock, 17@17½c.

BOSTON, Oct. 16—Butter—Creamery, extra, 24c; western, extra, 23c; dairy, extra, 22c; imitation creamery, 16@18c; western ladle, 16½c; print creamery, 24@25c; box creamery, 23@24c.

Eggs—Fancy near by, 28@30c; choice, fresh, 23c; Michigan extra, 21c; western, 19@20c; fair to good, 18@19c.

ST. LOUIS, Mo., Oct. 16—Butter—Steady; creamery, 19@24c; dairy, 14@19c.

Eggs—Steady; 15c.

KANSAS CITY, Mo., Oct. 16—Butter—Creamery, 19@22c; dairy, 16c.

Eggs—Fresh; 14c.

CINCINNATI, Ohio, Oct. 16—Butter—Quiet.

Cheese—Firm; good to prime Ohio flat, 12½c.

Eggs—Easy; 15c.

WASHINGTON, D. C., Oct. 26—Butter—Market firm. Extras 24c; choice firsts, 23c; fine imitations, 19c.

NEWARK, N. J., Oct. 16—Butter—Market quiet, 24c for extra creameries. Receipts fair.

NEW ORLEANS, La., Oct, 16—Butter—Market easier; 24c.

Cheese—Unchanged.

Eggs—Dull; 16c. Weather warm.

BALTIMORE MARKET.

BALTIMORE, Oct. 12—Butter—Receipts of fresh creamery direct from western primary points continue light, and about thirty per cent less than was received at this time last year, which shrinkage in volume being but a reflex of the condition at the dairies and in the creameries throughout the west, warrants the advance in prices and the sustaining of the advance on the highest grades, in harmony with the law of supply and demand, restraining as it does, the desire on the part of the distributors to possess themselves of none but the best, and compelling recognition of the redeeming points of much of the weaker grading that, but for the scarcity of extras would fall out of line and straggle along, way into the winter. We think it safe to say that the present is the brightest period in the history of makers of poor butter, but if it results in a relaxation of effort to improve the quality generally, it will be most unfortunate, for the success of the dairy depends upon the ability to compete with producers abroad, and they make quality the prime consideration. Imitation creamery and ladles are very scarce. Roll and store-packed are in light receipt and quick demand.

READING NOTICES.

All Reading Notices under this head are at the rate of 25 cents per line.

Two Fine Dairy Farms to let on shares on favorable terms to experienced dairymen who can give good references. One contains 320 acres, stocked with high grade dairy cattle. The other contains 400 acres, with or without stock. Also wanted: an experienced hand with dairy cattle. Both farms conveniently located. THOS. H. KELLY, Box 205, Owatonna, Minnesota.

Auction—75 choice high grade Jersey cows, fresh or due soon. Sold to the highest bidder, Thursday, Oct. 26th, on the Fair Grounds, Greenfield, Mass. A chance to buy high class young cows of great dairy capacity in car load lots. Certificate of tuberculin test furnished with each animal. Sale under cover and will be positive. Send for descriptive list to STOUGHTON & BURNHAM, Montague, Mass.

Wanted—An energetic young man with a thorough knowledge of handling milk, to manage a milk depot in a prominent Virginia town, handling about 300 gallons per day. Price and satisfactory references required. Address F. C., care Hoard's Dairyman, Fort Atkinson, Wis.

Does your large farm or dairy pay you? if not, I will put it on a paying basis if given management. Salary one hundred dollars per month. Nothing less considered. Can give best of references. Speak three languages. Address No. 25, Hoard's Dairyman, Ft. Atkinson, Wis.

For Sale— Milk, Butter and Egg business, near Pittsburg, Pa. Town of 25,000. Handle 250 gal. daily. Own building 40 x 40, 4 horses and wagons, boiler, engine, etc. Doing $1200 per month, clearing $300. A modern plant. If sold during October $3000. Write G. W. L., 1616 Bayard St., Alleghany, Pa.

Wanted—Situation as foreman or manager on a first-class dairy farm. Can furnish full references as to ability and character. Address "L" St. Ives Park Farm, Fullerton and 64th Ave's, Chicago, Ill. 36-2

Wanted—Man and wife for dairy. He to drive milk wagon or do general farm work. Must understand separators and the care and feeding of stock. She to assist in dairy and house work. Address Box 75, Dansville, N. Y.

For Sale—very reasonable, two choice reg. H. F. bulls, 16 and 24 months old, gentle, well marked, prepotent sires. T. C. RANKIN, Boston, Pa.

For Sale—Holstein Friesian bull No. 24305, calved Dec. 16, '95, butter bred, weight 1900 lbs., also H. F. bull calf, son of the above, 6 mo. old. Prices reasonable. F. E. LAWSON, Walworth, Wis. 36-2

Wanted—1 bull calf and 2 heifer calves, Guernsey or Ayrshire, under 200 pounds each, weaned, registered, bull no relation to heifers. To ship by express. West of Miss. river preferred. State pedigree, etc. E. M. SANDERS, No. Powder, Oregon,

For Sale—Small fruit and dairy farm, three miles from Springfield, on main road. Best route in city. Milk sells for 25c a gallon. Part cash, balance 5 years time at 6% interest. J. C. MILLER, Springfield, Mo.

To make your wife love you buy "Garland" Stoves and Ranges.

For Sale—Three fine Guernsey bull calves, by SEBASTIAN HELLER, Calumetville, Wis. 35-tf

Wanted—A car-load of good milch cows, any breed except Holsteins. Must be fresh or springers. Address, FALICON, Clarksville, Mo.

Wanted—A working manager for a small 20 cow private dairy farm. Knowledge of butter making and general farming required. An active energetic man wanted. ARLINGTON DAIRY, Bangor, Mich.

Married man would like position on dairy farm. Experienced butter maker. References given if desired. Address BOX 375, Plainview, Neb., stating wages.

Wanted—A dairyman who would like to come south to take charge of a first-class dairy. Address "E," Glenraven P. O., Tenn. 34-3

A Baby De Laval Separator No. 3, capacity 600 lbs. an hour, 30-gal. churn, butter worker, 6-bottle Babcock tester, shafting, pulleys, belts, etc. Price $100.00. Separator good as new and cost $200.00. E. R. BALSLEY, Troy, Wal. Co., Wis. 34-tf

Herdsman wanted who is a good feeder and milker, and wants steady employment. For particulars address A. J. DAUGHERITY, Streator, Ill. 32-tf

Excursion Tickets to Good Roads Convention at Madison, Wis., Via the North-Western line, will be sold at reduced rates, October 26, limited to October 27, inclusive. Apply to agents Chicago & North-Western R'y.

Excursion Tickets to Good Roads Convention at Waukesha, Wis., Via the North-Western Line, will be sold at reduced rates, October 21, limited to October 23. Apply to agents Chicago & North-Western R'y.

Excursion Tickets to Good Roads Convention at Janesville, Wis., Via the North Western Line, will be sold at reduced rates, October 25, limited to October 26. Apply to agents Chicago & North-Western R'y.

Excursion Tickets to the Great American Exposition, to be held at Omaha, Neb., until October 31, 1899. Via the North-Western Line, will be sold at reduced rates. from certain stations on specified dates. For rates, dates of sale and limits of tickets apply to agents Chicago & North-Western Railway. 22-sp

To California, via the Midland Route.—Every Friday night, at 10:35 p. m., a through Tourist Car for San Francisco, carrying first and second-class passengers, leaves the Chicago, Milwaukee & St Paul Railway Union Passenger Station, Chicago, via Omaha, Colorado Springs and Salt Lake City (with stop-over privileges at Salt Lake City), for all points in Colorado, Utah, Nevada and California. The Tourist Car berth rate from Chicago to San Francisco is only $6.00, and the sleeping car berths should be reserved a few days in advance of departure of train. Through tickets and sleeping car accommodations can be secured from any agent in the east, or by applying at the Chicago, Milwaukee & St Paul Depot or City Ticket Offices in Chicago. Send for our free illustrated California folders. Address Geo. H. Heafford, General Passenger Agent, Chicago, Ill. 29-sp

Another Big Creamery Learns Its "Hollow-Bowl" Separator Lesson.

The Fabius Creamery Co., of Fabius, N. Y., is one of the largest in New York State. For four years it had used "hollow-bowl" separators. Like a good many other co-operative creameries otherwise well managed, it paid very little attention to separator representations and supposed that all separators were "about alike." But on finally being induced to make careful comparative test, on top of just having replaced its older "hollow-bowl" machines with brand new ones of the latest type, it finds that it has been throwing away **AT LEAST $1200.– A YEAR** that would, with the use of **"ALPHA"** machines, have gone to its patrons and stockholders. By vote of its directors it has now put in **"ALPHA"** machines and has thrown out the new "hollow-bowl" ones which it is advertising for sale at half-price.

(COPY.) FABIUS, N. Y., Sept. 23, 1899.

THE DE LAVAL SEPARATOR CO.,
New York.

Gentlemen:—For four years we have been using "United States" separators in our creamery. They were giving perfect satisfaction *because we knew of nothing better.* In June last, however, just after we had arranged for the purchase of a new 3000 lbs. "U. S." turbine machine, your representative called and persuaded us to place alongside of it an "Alpha" No. 2 for comparative tests. The "Alpha" machine from the start showed closer skimming than the "U. S.," and in a 30 days' test showed a better average.

When our Directors met to make definite purchase, however, and you people insisted upon full list price for your machine as against the very low figure at which the "U. S" was quoted us, it was not apparent to the majority of our Directors that we would be justified in paying this much higher price for your machines. We not only purchased then the "U. S." machine which was in our factory, but two others, which with the one we had purchased a little more than a year ago made four "U. S." machines.

We were much surprised, when these machines were placed, to find that our *30 h.-p. boiler* would not furnish sufficient steam for their operation, in connection with the regular work about the creamery. We decided, therefore, to give the "Alpha" another trial rather than purchase a larger boiler. This time you placed with us machines of your latest device, which were run alongside of the "U. S." and careful competative tests made. These tests were made by myself and our operator, and I am in a position, therefore, to vouch for their accuracy.

During the last year we handled 9,723,369 lbs. of milk. Our tests proved to us that through closer skimming the "Alpha" machines would have produced for us from such quantity of milk 5,163⅓ lbs. more butter-fat than the "U. S.," which at 18 cts. per lb. would make an additional profit of $929.40. On account of the "Alpha" machines being operated with less power, our coal bill in one year will be reduced $206.53. In addition there is considerable labor saved in handling, on account of the *"Alpha" bowl being more easily and quickly washed*, and on account of its not clogging and its not being necessary therefore to clean it so often. There is a saving also on account of the "Alpha" producing a more churnable cream, which subjects us to less loss of butter fat in the buttermilk.

Taking all of these items into consideration we are convinced that the use of "Alpha" machines will increase the net results to ourselves and patrons *at least $1200.– per year. With such a showing we would not have been justified in continuing the use of the "U. S." machines even though they were presented to us free of cost and kept in repair without charge*, and our alternative was to purchase "Alpha" machines. You may consider this a formal acceptance of your machines, full settlement for which will be handed you within such time as agreed upon.

FABIUS CREAMERY CO.,
W. L. HAMILTON, Sec. and Treas.

The experience of the Fabius Creamery Co. must be simply that of any creamery in which somebody takes enough interest to determine what the differences between separators really amount to, and where this may mean the use of an **"ALPHA"** machine in comparative test we are glad to supply it. It means a sale and a profit to us and **A FIVE TIMES LARGER PROFIT EVERY YEAR** to the creamery making the test.

"THERE'S MORE IN THE MAN THAN THERE IS IN THE LAND."

(Extract from Address of Col. R. J. Redding, President of Georgia Dairymen's Association.)

"In conclusion it may by said that dairying is like almost any other business in life. You all remember Sidney Lanier's "The Story of Jones of Jones County," of which the first stanza read:

"I knew a man and he lived in Jones,
Which Jones is a county of red hills and stones,
And he lived pretty much by gitting of loans.
And his mules was nothing but skin and bones,
And his hogs was as flat as his corn-bread pones,
And he had 'bout a thousand acres of land."

The succeeding stanzas inform us that "this man," which his name was also Jones, finally sold out "lock, stock and barrel" to a man named Brown, and moved to Texas.

In five or six years this man Jones managed to beg and tramp his way back to "old Georgia," and humbly called at the gate of the fat and lazy and comfortable Brown and was invited to rest his weary bones and partake of Brown's store of juicy spare ribs and back bones and golden-hued butter that had "growed" on the old farm of "red hills and stones." The final couplet represents this man Jones as rising from his burdened chair and overburdened "inwards" and exclaiming:

"That whether men's land was rich or poor.
Thar's more in the man than there was in the land."

ENGLISH JERSEYS VS. ENGLISH SHORTHORNS.

"The butter tests at Tring are again of a remarkable character," says the (London) *Dairy* of September 15th. "The average yield of all Jerseys was one pound, 14 5-10 ounces, and that of all Shorthorns, one pound, 9¾ ounces. The principal results will be seen in the following precis of the details of the experiments. The third column shows the number of pounds of milk given by each class used to produce a pound of butter, This is called the "butter ratio." The last column is also most instructive, for it gives the number of days for which the cattle of each breed actually shown, were in milk. The first column shows the number of animals of each kind exhibited, and the second their average weight per cow;

	Number.	Lbs. average live weight.	Average yield butter.	Average butter ratio. *	Average days in milk.
Shorthorns.	19	1387	1 10 31-38	33.34	60 7-19
Cross-bred.	7	1132	1 9 19-28	34.08	29 4-7
Dutch.....	1	1473	1 8¼	28.61	10
Jerseys.....	45	863	1 14 7-36	18.43	102 29-45

* Number of pounds of milk required to make one pound of butter.
Ten pounds of milk are approximately equal to one gallon."

Here we have the average record of forty-five selected Jerseys competing with nineteen of those much be-praised English, dairy Short-horns, the farmer's ideal dual-purpose cow, according to the logic of Prof. Shaw and J. McLain Smith. The Jerseys weighing not quite two-thirds as much as the Short-horns, and, therefore, requiring only about two-thirds as much food for personal maintenance—a fixed charge from which no profit can be derived—make, practically, 4½ ounces more butter each per day. Let us be on the safe side, and call it an even quarter of a pound, and, disregarding the exceptional persistence of the Jersey as a milker, estimate each cow in milk for three hundred days. This puts the Jersey seventy-five pounds of butter ahead, worth on the average, not less than $15.00, which is certainly not an inadequate offset to the claim of extra value for the Short-horn's calf.

We do not care to argue the case at this time, but submit the evidence to the consideration of practical dairymen, who keep cows for profit.

From A Vancouver Dairyman.

ED. HOARD'S DAIRYMAN:—I was pleased to see my letter in your paper, and I thank you for the information you so kindly supplied, I fear, however, that my letter may have a tendency to create too favorable impression as regard dairying on Vancouver Island. It is not by any means an ideal dairy country. The climate is certainly very mild, and I consider it delightful after my experience of cold winters in the central states. But we have a long dry summer, when the herbage dries up, and few farmers are so well posted in their calling as to provide green food for the cows, while silos are practically unknown.

There is a good deal of natural herbage on the wooded ranges, which turn out beef early for market without extra feeding, and the cows come home well filled up, with extended udders. But the dairy business is only in its infancy, and we have a great deal to learn and unlearn before we can begin to make dairying pay.

In the first place we lack a good breed of cows. With the importation of thoroughbred Jersey bulls, this defect will soon be remedied. Then the price of feeding stuffs is very high, and I see no prospect of its becoming cheaper. We must grow on the farm everything the cow needs. With a fertile soil and good climate, we can raise fine crops of oats, peas, mangels, etc., etc,

Then again our market is not all one could wish. People prefer creamery to ranch butter, the creamery article bringing about ten cents per pound more than ranch butter. And I do not wonder at it. So much bad and inferior butter is sent into Victoria markets, that people lose faith in farming, and naturally turn to the well put up and attractive creamery product. I have seen 200 lbs. of ranch butter in the rear of a grocery in Victoria that was not fit for axle grease. The store keepers take this butter in exchange for provisions. No distinction is made, and it is all placed together in a cupboard or refrigerator. I have had to remonstrate with my grocer for the careless way in which he handled my butter, and I did not wonder at butter becoming unfit to eat when exposed to so many odors.

Can you feel any surprise that customers ask for creamery butter, paying thirty and thirty-five cents per pound, and refusing the ranch butter at twenty-two and one-half and twenty-five cents.

I wish HOARD'S DAIRYMAN was in every household, and that the people would read its instructions. We want cleanliness in the dairy, first of all, then the knowledge essential to the production of a first-class article. I know from experience that people in town *will* buy ranch butter when it is good. I get thirty cents per pound for mine from private customers, and we have seldom been able to supply the demand.

I know farmers who get thirty-five cents, and one farmer who a year or two ago got forty cents per pound for all his butter from sixteen cows, all the year around, and he could not meet the demand. The secret of this butter was its excellence. But so long as farmers attempt dairying in a slipshod manner, keeping cows that wont pay their board, paying little attention to the general rules of cleanliness in the dairy, allowing their cows to pick up a living as best they can and regarding butter day as the bane of the week, so long will we hear the antiquated cry that "dairying don't pay."

I would be sorry if any of your readers inferred from my letter (which I did not expect you to take so much notice of) that B.C. was an ideal dairy county, but I can say this much from my own personal experience that dairy farming does offer a reasonable measure of success when pursued intelligently and industriously. And it is in the power of us all to make the dairy a profitable branch of farming, and a pleasure as well.

Metchasm, B. C. J. D. REID.

Soy Beans.

(Press Bulletin, Kansas Experiment Station.)

There are a number of varieties of soy beans, but the early yellow soy has proved the best. They are erect growing, with from one to six or more stems branching out from near the ground, and reaching a height of from one and one-half to three and one-half feet; seldom falling down, except in very rich, loose land. The branches are thickly studded with pods from the surface of the ground to the top; a single plant having sometimes as many as two hundred pods, containing from one to four beans, the usual number being three. The soy bean is a remarkable drouth-resister, and will do comparatively well on thin land. However, they respond very readily to plenty of moisture and good soil. Being a legume, if the bacteria which produce the tubercles on the roots are present in the soil, they leave the land richer in nitrogen, the same as clover does. The land may be inoculated by getting earth from a field that has the bacteria in the soil, and planting it in the rows with the beans. We used a fertilizer attachment to a hose drill this year, with good success. Planting should not be done until the weather is warm—after corn planting. They will make a fair crop after rye or wheat, if the season is favorable. The ground should be well prepared, and the beans planted near the surface. We plowed the ground last spring, going over what we plowed each day with Campbell's Sub Surface Packer, and planted the beans immediately, with a press drill, stopping holes so as to plant in rows thirty inches apart, and from one to two inches in the row. This required thirty pounds (one-half bushel) to the acre.

They may be cultivated as other crops; keeping the soil in good shape, and the weeds down, is all that is required. We used the spring-tooth cultivator, except in a few places where the weeds obtained a start, on account of the wet weather. The crop can be handled so as it will not be necessary to use the hoe at all. Land that has been lately manured is liable to give trouble, as it is usually weedy.

Until this year the harvesting has been the great problem, but we found that there are machines manufactured for the purpose, and have tried several of them, and found them to be successful; so the harvesting no longer stands in the way. The yellow soy does not shell readily, and so can be let stand until well ripened. We began harvesting when most of the pods had turned brown, and a few of the top leaves were sticking on. The bean harvester has large knives which cut the stems just under the ground, cutting two rows at a time, and throwing them together in a windrow. An ordinary one-horse hay rake will take two of these windrows at a time, and the horse walks between them. We raked and shocked immediately after the harvester, and left them to cure in the shock. Threshing was done in the field with an ordinary separator, using all blank concave, and running no faster than necessary to keep the machine from clogging in the shakers and riddles, so as not to crack the beans.

The following is the cost of production on the College farm this year. The work was conducted as nearly as possible on a commercial basis, the object being to find what could be done on a large scale. The sixty acres from which the following is taken comprises several fields, which vary widely in many respects from good land to very poor, on the whole perhaps below the average of farm land. Labor is computed at $1.25 per day for a man, and $2.50 per day for a man and team. The cost per acre for the various items was as follows: Preparation of land, $1.35; planting $0.30; cultivating, $2.00; hoeing, $0.70, which was confined to a few patches; harvesting, $1.40. The harvesting is considerably above what it will be when the regular harvester is used, but we did not receive the harvester in time to begin, and the old method is much more expensive.

The threshing required four teams and six men, besides the machine force, which was hired at $15.00 per day, board and coal not included. The total expense for threshing the sixty acres, which took four and one-half days, aside from the cost of coal, was $155.25. The yield of the sixty acres was 932 bushels, making the cost of threshing 16 6-10 cents per bushel. The sixty acres of beans averaged fifteen and one-half bushels per acre, making the cost of production 55 cents per bushel or about $8.40 per acre.

Soy beans as a feed take the place of oil or gluten meal and in composition are richer than oil meal. In feeding them to milch cows, fattening cows and hogs, they have given astonishing results. In two experiments carried on last winter in feeding hogs, the addition of one-fifth soy bean meal to kafir corn gave practically double the returns from kafir alone. The ten hogs fed kafir meal alone, during a period of fifty days, ate 2,872½ pounds, and gained 441 pounds; the ten fed kafir meal four-fifths and soy bean meal one-fifth, ate 3,766 pounds of the mixture, gained 866 pounds, and sold for 10 cents more on the hundred than the other lot.

When the beans are let thoroughly ripen in the field the straw is worthless, but if cut and cured while green makes excellent hay. They make excellent hog pasture and are a good crop for soiling.

Results Make Reputation.

Singer Machines, either lock-stitch or chain-stitch, are the successful result of long experience and constant improvements in the endeavor to make nothing but the best sewing-machines for family use. The accomplishment of this result requires six of the largest, best-equipped factories in the world, and the best inventive talent of the age. Twelve thousand workmen are employed in these factories. Experience counts with THE SINGER MANUFACTURING COMPANY. The average term of employment among these workmen exceeds a decade.

Sold on instalments.
Old machines taken in exchange.

The Singer Manufacturing Co.,
"Sewing-Machine Makers for the World."

Packing Dairy Butter.

A problem which puzzles many of our good dairy butter makers to-day, is to put up their butter for market in such a way that it will bring the price it merits.

The style and size of package depends upon the market. Where one is obliged to take their butter to a grocer, the gallon and half-gallon crocks are usually preferred. If one has private customers, it depends wholly upon the quantity used. The gem paper packages are light, substantial and reasonable in price, ranging in size from one to twenty-pound packages. Where you ship to large grocers or commission houses, the sixty-pound white ash tub is desirable. A very good packer for putting the butter in small packages can be made by taking a common wooden potato masher, sandpapering until it is smooth, scalding and cooling. For the tubs one needs a packer, such as those used by creamery butter makers. Before putting butter in crocks, be sure that they have been thoroughly scalded and cooled. Never use crocks which have held anything but good, pure, sweet butter; as lard, yeast, pickles, or in fact, almost anything will affect the glazing of the jar enough to taint the finest of butter, if it is left in a jar any length of time. In packing, only put in small quantities at a time, and press down firmly, so

It is Easy

for you to detect tuberculosis in your cattle by the use of

Mulford's Tuberculin

No skilled assistance or technical knowledge necessary.

H. K. MULFORD COMPANY, Chemists,
416 S. 13th St., Philadelphia.
112-114 Dearborn St., Chicago.

there will be no pools of brine; continue in this manner until the butter is rounded over the top of jar. Even the top by taking the ends of a piece of twine (which has been wet) in both hands, holding it close against top of jar. With a sawing motion draw across, then holding jar slanting over bowl or churn, carefully lifting the upper edge of butter from jar with ladle, the air will get under the layer, which will drop off, leaving an even surface, which looks much nicer than when smoothed off with a ladle, which is apt to give a salvy appearance.

Place on the top a circle or cap of butter cloth. (These circles may be procured of any dealer in dairy supplies for a few cents per thousand in sizes to fit any package.) On top of cloth put an even layer of nice, clean butter salt, over which sprinkle a little water, and you will have an air tight crust. Cover this with fresh clean manila paper; fasten on by passing twine below rim of jar two or three times and tying with single bow knot. Trim paper evenly from one-half to three-fourths of an inch below twine, and you will have a package which will find ready sale.

Mark your package with name or private mark, always the same, and in a manner which is not easily imitated, as I have known grocers to go so far as to write the name of some good butter maker on a jar of any butter they happen to have, in order to make a sale.

It does not take long for a good butter maker to gain a reputation in the circle where the goods are consumed, and after a few trials the goods are called, by name or mark, and the customer does not find it necessary to have the butter opened for inspection.

If, by accident, you happen to have a poor lot of butter, tell your dealer and let him sell it for its value. Don't run the risk of losing your hard earned reputation of a good butter maker, for the few paltry cents gained by palming off a lot of poor butter under your regular mark. If one has not been fortunate enough to secure regular customers, at a good fair price, and is making a sufficient quantity to ship, it is much less labor, and more satisfactory to send it to some good, reliable commission firm.

Use the best white ash sixty-pound tub, thoroughly washed, scalded and soaked in brine, to prevent mould. Always line with good parchment, which it is also advisable to scald and brine. After the tub is neatly lined, pack and even off same as the jars, turning the parchment (which should be left above top of tub about three-fourths of an inch) over the butter, laying in small pleats, putting the cloth circle over the parchment, and covering with salt. Fasten the cover of tub down with three tins placed at an equal distance apart on the cover.

In fact, do not neglect any little thing, no matter how trifling, which will add to the neatness of the package, as neatness in this respect is just as essential as in the manufacture of the butter, and there we know it is ene of the important factors. Remember, it is the outside of the package which the consumer sees first. I never realized until a short time ago how many good butter makers there were who were careless it this one respect. Perhaps by mentioning one or two cases, the reader will not think that I am a crank on this subject, or,as I have been told, that there was too much red tape about my butter making. While in a grocery store not long ago, an old gentleman came in with fifteen pounds of very nice butter in prints, wrapped in hand towels. The dealer offered him two and one-half cents per pound less than they were giving for butter in crocks. The old gentleman was quite indignant, but was told that they had no place where they could keep print butter free from taint. After the old gentleman went out, being a little curious over the butter, I watched to see what was done with it. The dealer took it from the towel, placed it on a platter, covered it with clean, fresh-looking paper, called an errand boy, and sent it to a hotel near by, remarking to me at the time that Mrs. So and So had left an order for good butter, and was willing to pay a little extra. I knew that he had refused to pay within 2½ cents as much as crock butter was bringing, only a few minutes before. As it takes so little for an excuse to drop on the price, it stands us in hand not to leave any show for the excuse. Never use any cloth about butter, which has the suspicious look of coming from some worn-out garment.

While waiting at the depot, my attention was called to a lot of jars piled on the platform. On inquiry I found they contained butter, which surprised me very much, as out of fifteen or twenty jars not one of them was tied up neatly, and they were to be shipped twenty-five miles. I don't think any of them having paper over the top had anything but newspapers, and on one there was just a thin cloth between the printer's ink and butter. The taste of the ink would, in a short time, permeate the whole jar of butter. Many of them had large, coarse cloths, some even faded-out calico, over the top, and not one of them trimmed off, but corners and ravelings flying as the wind blew them. Please don't think that carelessness is confined to the dairy butter makers. Far from it.

While at the dairy convention last December, judge of our surprise upon lifting the covers of some of the creamery tubs to find the salt fairly black, where a dusty cover had been put on. Others hadn't any salt on the cloth cap, while on many the parchment side lining was left from two or three inches above the edge of tub, on some the covers were put on so that the lining was below the edge of the cover; on others it was crowded down in rolls on top of salt. While many of them were left about three-fourths inch above tub, folded neatly over the edge of the butter, being laid in tiny pleats so that it would set smoothly. Then the cloth cap with an even layer of salt on top. Any butter maker, who has any interest in his work, could see at a glance the difference. —*Ex.*

The Ohio Dairy Exhibit.

ED. HOARD'S DAIRYMAN: — The Ohio State Dairymen's Association appointed a committee of three to arrange for an exhibit of dairy products at its next meeting, which will be held in February at Townshend Hall, Ohio State University, Columbus, Ohio. The committee consists of Prof. Thomas F. Hunt, Ohio State University, Columbus: Elden F. Smith, of the firm of W. B. Smith & Son, Columbus, and F. M. Wilson, Selma, Clark County. This committee has arranged for cash premiums on best 60 lb. tub of butter; on best five one-pound prints of butter; on best full cream American cheese, Cheddar, Flats or Young Americas, and on best Swiss cheese. A special premium of a Jersey calf of either sex has also been offered for the best five one-pound prints of butter made upon the farm, the product of one herd, and it is expected that other special premiums may be offered.

Space has been provided for an exhibit of dairy apparatus and supplies, while machinery and apparatus of the Dairy School will form a part of such exhibit.

THOMAS F. Hunt.
Chairman of Committee.

Protect Your Feet From The Cold and Wet.

All Knit "BALL-BAND" WOOL BOOTS, are the best.

They are the most comfortable and will wear twice as long as others. "Ball-Band" Socks and Rubbers are the same high quality as the All-knit Boots. They have superior features not found in others. Be sure that the trade-mark "Ball-Band" is on every pair. There are more imitations and counterfeits this season than ever before. We make all our own rubbers and are not connected in any way with any Trust. Insist upon getting "Ball-Band" goods from your dealer and take no others said to be "As good as," etc. **Mishawaka Woolen Mfg. Co., Mishawaka, Ind.**

YOU CAN PREVENT BLACKLEG

among your cattle by the use of Parke, Davis & Co.'s **BLACKLEG VACCINE.** Every lot is tested on cattle and found reliable before a single dose is put on the market. It will prevent **BLACKLEG** if fresh product is used, the same as vaccination prevents Smallpox in the human family. Operation simple, and easy to perform. Specify P. D. & Co.'s, and get the kind that is always reliable. For sale by all druggists. Write us for literature and full information, free on request.

PARKE, DAVIS & COMPANY, Detroit, Michigan.

Mr. Wheaton's Canadian Dairy Notes.

Canadian Dairy Cows—Want of Records.

ED. HOARD'S DAIRYMAN:—Though we have reason to be proud of our record as producers of a fine quality of butter and cheese and of the extent to which these industries have been developed, yet our dairymen cannot lay claim to very much in the way of definite information regarding the amounts received from individual cows. Even in some of our oldest, and what are considered to be our very best dairy districts, there are very few dairymen who keep an individual record for each cow in their herds.

There are good cows in Canada, as the various milking competitions and the books of our cheese factories and creameries will show, but, then, there are a great many poor ones. We question whether there are not as many cows kept by our dairymen at a loss as there are of those that return a profit. Even this present season this might prove to be the case, if a complete record of all the cows in the country could be secured. With high prices for dairy products of all kinds, a cow ought to be able to show a balance on the right side, if there were any possibility of her doing so, provided, of course, that she were supplied with an abundance of good, wholesome food.

A few years ago we secured from some of the cheese factories in western Ontario some data in regard to the largest and smallest amounts per cow which patrons had received for the season. The figures were simply astounding. Taking some one hundred factories the highest average amount received per cow by any patron for the regular cheese season, was shown to be about thirty dollars (we have not the exact figures at hand just now) and the lowest average amount between nine and ten dollars per cow. In one factory where the highest amount received per cow by any patron for the season, was sixty-five dollars, the lowest amount was some thirty-two dollars, making a difference between the poorest and the best of about thirty-five dollars per cow. This was at one of our best factories, where the making, milk hauling, etc., was put at the lowest possible cost but where the conditions were just the same for one patron as for the other.

These figures give some idea of what a fund of information might be secured, if the books of all our cheese factories and creameries were closely examined, and the returns which each person received per cow, made known. But such information would not be nearly as important as that which every dairyman could obtain, if a yearly record of each individual cow in his herd was kept.

Such a record should include the quantity and quality of milk each cow gives every day as well as the cost of keeping her for a year. If this were done conscientiously and accurately for a year by every one who keeps cows, or at least by every one who is making a business of dairying, what an eye-opener it would be. There would immediately be a large surplus of poor unprofitable cows offered for sale or disposed of in some other way than for milk production.

But why is it not done? It would seem that keeping such a record should be a dairyman's first concern, if he were conducting things in a true business-like manner. If he does not know to a nicety what each of his cows are doing, he cannot so plan things as to make the highest profit out of his business. A record kept for one year alone, we think, would be sufficient to induce many of our dairymen to remodel their herds, and get in some new and better blood.

We may well ask why such records are not kept more generally by our dairymen, if they are of so much importance? Most of them seem to be satisfied with merely guessing at, or a general summing up of results. While something may be learned in this way no definite or practical information can be secured, that can be put to good account in maintaining or securing a dairy herd.

The mere mention of a daily or yearly record of what each cow in a herd does, brings to the minds of many dairymen an immense amount of unnecessary work that will not pay for the time or trouble it involves in accomplishing. While to keep such a record requires considerable attention and some little time we are confident that any expenditure in this direction would be repaid many times over in the amount of definite and accurate knowledge a dairyman would have of his own business that could be put to profitable account in the future.

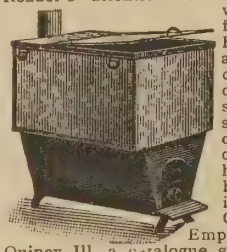
But if proper plans were made, such a record would not take up so much time and attention as some imagine. Besides, if gone into in the proper spirit, it would become more interesting as the time passed. To one throughly interested in dairying the knowledge of each individual cow to be obtained in this way would make the work a real pleasure. And then what a lot of real satisfaction there would be in knowing just where one was at in his dairy business.

As we have already pointed out, this is one of the things in which the great majority of Canadian dairymen are lacking. Many of them have been going on year after year keeping and milking cows and thinking they were making money out of the business when the balance was still on the wrong side of the profit line. We would like some special effort made to secure more information as to what individual cows in the herd are doing. And to this end it would be money well spent if some of our dairy associations would offer prizes for the best kept record of dairy herds. A hundred of such records containing data as to what each individual cow in the herd had done for a year would form the basis for a most profitable discussion at the annual conventions.

J. W. WHEATON.

Toronto, Canada.

Note and Comment.



Silos and Silo Filling—Wire Silo Hoops—Summer Feeding of Silage—Frozen Silage—Blankets vs. Shoo-Fly.

ED. HOARD'S DAIRYMAN:—It is wonderful how the silo building keeps up, even as late as this October 7th. Some are building now, and intend to put in their field corn, now standing in the shooks fully three weeks. One man finding his silo little more than half full when settled, now has a husker and shredder at work running the shredded material on top of the silage, wetting it down thoroughly as it goes into the pits. The possibility of results not coming up to expectancy, when these experimental ventures are fed out, is a matter of speculation, but whether it fails, or succeeds, it will be found that silos—all of them—will be filled with fresh cut corn next year, and other things being equal, it is quite as cheap to draw needed moisture from the field in the stalks as to pump it, and sprinkle down the silage for the required amount of moisture.

The men who used wire fence hoops for silos, are much pleased with the venture. A builder who has erected six the past fall, informs me that he has found nothing that equals a wire fence hoop, the torsion of the wire making an ideal "pull." Some builders are getting the No. 9 coiled wire in bundles, and are using it, 10 in a band, three and a half feet in width. This wire is known

Farmers' Handy Feed Cooker.

Reader's attention is called to this device, which is sold at $12-50 for 50-gallon capacity. By feeding poultry and animals cooked food during winter, at least one-third of the feed is saved; also having stock in a healthy condition, preventing hog cholera among your hogs, and insuring the hens laying freely during the winter months. On application to the Empire Manufacturing Co., Quincy, Ill., a catalogue giving full description may be obtained. They are made in all sizes.

$50 A BULL CALF, solid color, out of Marion Drew II., 108,548, 231 lbs. milk in 7 days. 957 lbs. in a month. 7293 lbs. in a year. Milk tested 5½% butter fat. Sire Pero Pedro 44922, a grandson of old Pedro, out of a grandaughter of Old Pedro, with a record of 601 lbs. of butter in a year. GEO. A. BUCKSTAFF, Oshkosh, Wis

Just $35.00 buys a richly **butter bred** Registered Jersey Bull calf, Seven months old, solid color, and a **show** calf, inbred to the great cow, Landseer's Fancy. Money refunded if not satisfactory. Address M.A. COVODE, Noblesville, Ind.

Hood Farm Jerseys Same blood as Merry Maiden. Bull ready for service. Solid color, black points. First class individual. Dropped March 21, 1898. Sire, Chromo, sire of 12 tested cows, half brother of Merry Maiden. Dam, Milly Judd, 14 lbs. 3½ oz., double granddaughter of Diploma, the sire of Merry Maiden. Write for price to HOOD FARM, Lowell, Mass.

about here as the Frost wire, and sells at about three and one-fourth cents. Two men have hooped their silos with wire rope, which can be bought in odd lengths or second hand, very cheap. The ropes are put through lugs and brought up snug, the same as wire fencing. The fact is that the silo is now going through an era in invention, and possible in the not distant future silo walls will be done away with entirely, and we shall cord up the silage in some way, and keep it from decay, by using some kind of preservative, formalin, Freezine, or like chemical, and there will be little difficulty in getting some M. D. or Big Bug to give it a flaming health endorsement, and cows eating such preserved silage, may not need to have a tuberculin test, to pass a board of health.

***

One of the most level headed farmers in Ohio, is C. G. Williams, most careful and painstaking, and imbued with the spirit of investigation, a man who investigated for ten years to see whether the silo was a good thing to invest in, and then built one and pinned his faith right to it.

In a late *Ohio Farmer* he has given his experience in summer feeding of silage and from it we condense this for HOARD'S DAIRYMAN: Last year Mr. Williams became convinced that summer soiling was in the future part of the dairy economies, and so built another small silo for midsummer feeding. The drouth was not taken into consideration, but was a coincidence. The silo held 100 days' summer feed for the dairy.

With the drouth here, came an almost instant drying of the pastures, and the shrinkage of milk was remarkable. By July 1st, Mr. Williams commenced with a ration of twenty-five pounds a day, continuing it until July 13th. Before commencing to feed silage the shrinkage of milk was five per cent, but at the last date, the cows had not only overcome that, but had made a gain over normal of three and one-half per cent. For the next three weeks the ration was increased to thirty-three pounds, but so fierce was heat, flies, and dry pastures, that the cows fell off 3.3 per cent. Then the ration was increased to fifty pounds of silage, and the gain overcame the shrinkage, and plus 2.7 per cent.

On the 10th of Sept. the silage gave out, and green field corn was substituted—all the cows would eat, yet there was a notable shrinkage of milk, which continued until the silos were opened; but the effect is not yet noticeable owing to the brief time of silage feeding.

Mr. W. noticed that while all of the silage was eaten clean, the green fodder was not, nor would the cows make a full meal of it, without waste, and gathering up the leavings of one day, it amounted to twenty-five per cent of the cut green fodder. During the summer these cows had no grain, and went through the drouth with a full June flow of milk. As the dairy had the range of the pastures—and Mr. W. has fine ones, it is noticed that they would eat fifty pounds of silage a day. As that is a full winter's feed, will anyone please explain why any pasture was needed at all, or how pasture can compare with silage as a cheap summer food?

There is a question of dairy economics to be worked out along this line of pasturage vs. summer silage. We are pretty sure from what testimony we can secure, and our own limited experience with silage in the summer, that there is no way a man can secure so much, or as cheap, and above all so effective a summer soiling crop, as with corn silage put up the fall before, and the possibilities so sure of realization.

***

I note what your own Charley Jennings—may his shadow never be less, or his pencil have a dull point—says about frozen silage, also the opinion of Prof. Clinton, of Cornell. I have always thought the danger of silage freezing over magnified. After more than twelve years' experience with silage I could never find where the silage was frozen when we got down to the supposed place. I found that where there was a cover over the top of the silo, so that there could be no cold air "falling in" from the top, that in our coldest Ohio weather there would be no surface chilling even, of the silage. So after we have fed down far enough to clear our heads a few boards are thrown across the top of the silo, and a load of straw put on so that the interior of the silo seems quite warm, most of the time, from the heat of the warm mass below. If it is as Prof. Clinton supposes, that the silage takes no hurt in freezing or thawing because of the absence of oxygen, it is a valuable thing to know, as hundreds of men go to no little expense in protecting their silos from freezing, and in so doing, it now seems an unnecessary increase of cost without receiving corresponding benefit.

***

We always like to have our "shortkummins" pointed out, and take an interest in all, and any advice which may be tendered to us, so subjoin an extract from a letter received shortly after the item appeared in HOARD'S DAIRYMAN, about "Old Slicker's" blanket to protect her from flies. The letter went on to say: "Why did you not use Shoo-Fly? What use is your blanket? It cost ninety cents and it won't last you one summer, nor can it protect your cow all over, and thirty cents worth of Shoo-Fly would protect her all over, and all summer. The blanket won't keep off ticks, cure sores, or prevent skin diseases, and Shoo-Fly will. "Buff Jersey" and other dairymen use it, and like it. Why don't you?" We plead guilty to all of the above, but ask in all candor what is a fellow to do when his cows are pestered with flies that are so depraved, that the few about the barn will eat two quarts a day of a compound of cod liver oil, turpentine, carbolic acid, pine tar, and sulphuric acid and not phase them a bit. What chance has a cow with such a mild spray as Shoo-Fly, death on flies, or stick-um-fast, sifted upon her between showers? The Ohio fly was not brought up among Quakers, to be scared with an air gun, loaded with soup. The Ohio fly belongs to a Trust, wears gum shoes, has an aluminum extension to his bill, and wears a repellent mackintosh. Solemn facts!

JOHN GOULD.

Ohio.

Cedar Hill Jersey Notes.

Filling the Silo—Creamery Notes.

ED. HOARD'S DAIRYMAN:—We were caught in the midst of our ensilage cutting by a very heavy freeze, but are going right ahead and fill the silo with the frosted corn. Having been south for some years we do not remember just what kind of ensilage frosted corn will make, but to one who did not know it had been frozen he could not see by looking in silo that it was damaged. It looks just as bright and full of sap as one could wish for.

After putting up ensilage for ten or eleven years in all kinds of silos and under all kinds of conditions we have at last reached what we consider perfection in handling the crop. We are no longer troubled by men complaining of the heavy work of handling the loose fodder and the engine whistle does not toot for more corn as of yore. Our corn binder has revolutionized our work, less men, less teams, less work and more corn traveling up the elevator.

I extend thanks to the DAIRYMAN readers who gave me their experience on how to set engine and to connect to cutter. We followed advice given and now have a perfect rig. My engineer in five days run only lost his steam pressure once and that was caused by not cleaning out the flues. Our engine is a horizontal one, sets fifty-five feet straight line from a sixteen inch Ross cutter, and twenty feet to one side of line. We have a twenty foot shaft coupled on engine shaft and pully at other end on which drive belt runs. We have plenty of power both for cutter and creamery.

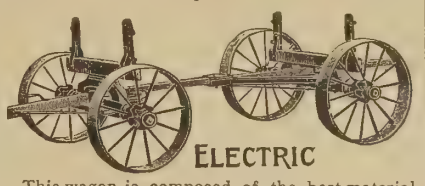
We have just placed a new separator in creamery room; it is a 20th Century DeLaval No. 3 Baby. We have bolted a pully on the large cog wheel, leaving handle on also so that when we do not have steam we can use handle by throwing off belt. Our skim milk in repeated tests shows 0.1%, which loss we can stand very well.

With thirty-nine cows and heifers in milk we are making thirty-four and one-half and thirty-five pounds of butter daily, with no pasture; are soiling with corn fodder and feeding cotton-seed meal, oats and corn ground together.

***

Prosperous times are all right, but we have found that we are caused many annoyances by them. When we order supplies from a distance we get word that houses are rushed and will fill as soon as possible, then the railroads bring the stuff as soon as cars can be got, and so on. We have wanted a good milker for some time but have not yet succeeded in getting one; every one is busy, no one out of work.

BUFF JERSEY.



Power for Farm Use.

ED. HOARD'S DAIRYMAN:—Say to S. G. F., of Suldal, Wis., to consider well all he wishes to do with a power, and then adapt the power to the work. We find a one-horse tread power very satisfactory in running separator for twenty-five cows, churning and turning grindstone. Can churn and sharpen any tool adapted to the grindstone at the same time, thus saving much in time. Bull doing the treading gets the much needed exercise. A two-horse tread does the straw and corn cutting, threshing and wood sawing. As any animal, bull, steer, cow or horse can soon be taught to tread the power, we are strongly in favor of its use on the farm.

Rock Reift, N. Y. J. Q. B.

Farm Wagon Economy.

The economy of this proposition is not all found in the very reasonable price of the wagon itself, but in the great amount of labor it will save, and its great durability. The Electric Wheel Co., who make this Electric Handy Wagon and the now famous Electric Wheels, have solved the problem of a successful and durable low down wagon at a reasonable price.

ELECTRIC

This wagon is composed of the best material throughout—white hickory axles, steel wheels, steel hounds, etc. Guaranteed to carry 4000 lbs.

These Electric Steel Wheels are made to fit any wagon, and make practically a new wagon out of the old one. They can be had in any height desired and any width of tire up to 8 inches. With an extra set of these wheels a farmer can interchange them with his regular wheels and have a high or low down wagon at will. Write for catalogue of the full "Electric Line" to Electric Wheel Co., Box 130, Quincy, Ill.

Banner Root Cutters

CUT BEETS, MANGELS, Turnips, Carrots, and all other roots and vegetables for stock feeding. **CUT FINE.**

Choking Impossible.

Run easy, have self feeder, separate dirt from cut feed. Five sizes, hand and power.

O. E. THOMPSON & SONS, Ypsilanti, Mich.

Largest Root Cutter makers in the world. *Catalogue free.*

Cow Hopple

For Kicking Cows.

Either from habit or from sore teats. **Price 50c.**

Also have a **Wart Cure** that will remove warts from horses, cows' teats or man. **Price 25 and 50c.** The goods are warranted. Sent Postage Paid. Send postal card for circulars

Agents Wanted.

Henry Bassett,

Salem, New Jersey.

AYRSHIRES Finely Bred and from the very best families. Stock for sale, bred for milk and butter qualities. Also fine herd Chester White Swine. Correspondence solicited.

FRED TSCHUDY & SON, Monroe, Wis.

High Test I offer the grand young bull Prince Mercedes DeKol, whose 4 nearest tested relatives have an average equivalent record of 24½ lbs. and 4.14% fat, and have won 1st, 2d, and two 3d prizes in H.-F. Offic'l Prize Contests. Others extra good. MALCOLM H. GARDNER, Darien, Wis.

HERD OF Holsteins For Sale.

Thirty head of registered Holstein-Friesians, all females except the bull at the head of herd, for sale on easy terms on five years' time if desired, with equal annual payments at 5 per cent interest, or will rent herd to responsible and experienced parties. Correspondence solicited.

15 CHOICE DAIRY Cows must be sold by November 3d. Five registered Holstein-Friesian cows and ten high grades, ¾ Holstein blood and better. Great producers. Rich breeding. All cows bred to a son of the $1,000 bull Netherland Carl, and almost full brother to the sweepstakes bull at Trans-Mississippi Exposition, 1898. Intelligent dairymen will find them a great bargain at the price they are offered. Write to-day for full particulars. **KARLEN & CO., Monticello, Wis.**

Markham Manor Farms. Simonsville P. O., Andover, Vt.

Holstein-Friesian cattle bred from the most fashionable butter families, individually large producers, and of the most approved show form. The herd contains seven daughters of Sir Netherland Soldene Clothilde, No. 18390, H. F. H. B., the most remarkable show bull of recent years. Also large English Berkshire Swine from noted prize winning and imported stock. Write for description and prices to **J. A. THORNTON,** Mgr., **Simonsville, Vt.**

Royal Bred Holstein Bull

Dropped May 22, 1899. His sire is out of a daughter of Pauline Paul, the champion butter cow of the world, who gave 18,669 lbs. milk which made 1,153 lbs. butter in one year, by a son of De Kol 2d, who gave, under the supervision of the N. Y. Experiment Station, 83¼ lbs. of milk in one day which made 4.30 lbs. butter, and in seven days, when 11 years old, made 26.57 lbs. of butter. His sire was the First Prize Holstein bull at World's Fair, Chicago, and for four generations he is backed by the greatest prize winner of the breed, both in Europe and America. The blood of the following cows, and many others with great records, also flow in his veins: Oude Empress, 114 lbs. milk in 1 day; Empress, 109 lbs. milk in 1 day; Mandate, 95 lbs. 5 oz; Ondine, 90½ lbs; Colantha, 89 lbs. 12 oz.; De Kol, 89 lbs. If you want individual merit coupled with rich breeding here you have it. **Price $65.00.** Speak quick.

WIS. LIVE STOCK ASSOCIATION, Appleton, Wis.

Cheaper Production of Milk and Butter.

[By C. MARKER, Dairy Superintendent, Calgary, Alberta, in the annual report of the Cheese and Butter Association of Ontario, for 1898.]

In dealing with this subject I fully recognize that it is a very comprehensive one, and that a great many factors should be considered individually, such as proper care and feeding of the dairy stock, etc., in endeavoring to solve a problem which has not, in a great many cases, met with the attention which it deserves from those who are directly interested, namely, the dairy farmers.

Outside of the initial place of milk production—the farm—great strides have been made during the last few years toward reducing the cost of manufacture and increasing the yield of butter, such as:

1. The invention and subsequent improvement of the centrifugal cream separator, which now enables the skilled dairyman to recover ninety-seven per cent to ninety eight per cent of the total quantity of butter fat in the milk, as against the good old way of raising the cream by gravity in the deep set pail or in the shallow pan, only recovering from fifty per cent to ninety per cent of the butter fat, according to the local condition under which the work has to be done. In defence of the latter, or gravity system, we sometimes meet with the statement that the cream separator "robs the calves" of the butter fat which they would otherwise get in the skim milk. Quite true, yet it is generally conceded by successful dairymen, that butter fat is not absolutely essential to the growth and development of young animals, and that we can buy and add to the separator skim milk such feed stuffs as oil cake, flaxseed meal etc., which will answer the same purpose as the ten times more valuable butter fat, when used in the right proportion with the skim milk.

2. The manufacture of butter in creameries, leaving in the hands of one or more skilled operators the work of making a uniformly fine quality of butter which can command the highest price throughout the year, as against the more or less primitive way of home churning by the individual milk producer, with the result that the quality of butter made by each would vary from time to time, owing, generally, to lack of proper facilities, pressure of other work, and inumerable other causes.

3. The introduction of the Babcock milk tester, which enables the careful butter maker to do better work with the cream separator and churn, by testing the skim milk and butter milk, and using it as a guide in making the best use of the facilities and conditions affecting the work which he has at his command.

So much for reducing cost of manufacture. Now, what has been done, or is being done, toward cheapening the cost of producing milk on the farms? Let each dairyman answer for himself.

Assuming that the dairy farmers of Ontario are following up dairying as a business, that is for profit, how many of them know the productive capacity of each individual cow in their herds, even approximately, and how much it costs to produce a pound of butter from each cow? This is a question that should be considered by every dairyman.

The facilities which the creameries in the various districts and the Babcock tester afford the farmers toward solving this problem for themselves, should not be under estimated, and this is the phase of the "cheaper production of milk and butter" to which I wish to refer for a moment or two.

Though I have not at hand any accurate statistics showing the average yield of butter per cow each year in Ontario, I venture to say that there is yet a great deal of room for improvement, and that it is quite possible to increase the yield of the dairy herds throughout by a course of good care, comfortable stabling, judicious feeding, selection and breeding.

This process may be comparatively slow, but it is sure. Not long ago I visited a section in Canada where dairying is carried on through the whole year; the average output of a certain creamery there was 150 pounds of butter per cow for the year, while the yield from one of the best herds averaged 250 pounds per cow. The following table, which I had occasion to compile at the time, shows the variation of yield of the different herds of forty-one patrons who furnished milk to the creamery in question:

9 received	$15.00 to $20.00	per cow for 12	months.
18 received	20.00 to 25.00	per cow for 12	months.
7 received	25.00 to 30.00	per cow for 12	months.
5 received	30.00 to 35.00	per cow for 12	months.
1 received	41.00	per cow for 12	months.
1 received	43.50	per cow for 12	months.

These are practical figures and speak for themselves. The intelligent use of the scales and tester would work wonders in some of these herds in the way of "showing up" the non-paying individuals.

How can we ascertain the value of dairy stock in a more simple and reliable manner than by careful milking, regular systematic weighing and testing of the milk from the individual cows and a carefully kept record of the results? Each point is equally essential to attaining correct information on this important question.

Milking.—These dairymen who decide to adopt this plan of procedure will not forget that milking should be done as nearly as possible at the same hour morning and evening; at any rate, there should be a uniform interval between the morning and evening milking, from one day to another. It goes without saying that the milking should be thoroughly and carefully done in order to get correct samples for testing, bearing in mind that the first portion of the milk, when drawn, may test as low as two per cent of butter fat while the latter part may go as high as seven per cent to eight per cent of butter fat; therefore, by thorough milking we not only obtain a better quality, but also a larger quantity of milk, as the secretion of milk is stimulated by quick and thorough milking.

Weighing.—The milk from each cow, under test, should be weighed, not measured, as soon as it has been drawn morning and evening, at least once a week and on a certain day of each week. The correct weight in pounds and ounces gives more definite information than the very comprehensive terms sometimes used as "A patent pail full twice a day," "A big pail half full at each milking," etc., as the case may be. The weights should be recorded on a slate, blackboard or sheet of paper used for that purpose, opposite the name or number of each cow.

Sampling the milk.—The samples may be kept in tightly corked bottles or jars, labeled with the number or name of each cow under test, written plainly; also "morning milk" or "evening milk" as the case may be, otherwise the samples are likely to get mixed.

A small closed cupboard nailed to the wall in the stable or milking-shed would be the right thing for holding the sample bottles or jars.

As soon as the milk from each cow has been weighed a sample taken with a small tin dipper is put into each respective bottle. A small pinch of powdered "bichromate of potash" is required to preserve the samples from souring until the test is made; this is generally kept in stock at all creameries or cheese factories for use in composite testing of milk sent in by the patrons.

The testing of the samples can be done by any one who is familiar with the working of the Babcock tester; the local creameries and cheese factories can do a great deal toward encouraging the work by testing the samples for their patrons and others who take it up. The butter-makers and cheese-makers will, no doubt, be only too glad to give any information and assistance in their power to assist a movement which, if carried out, can not fail to do a great deal of good all around. When a weekly sample is taken, the composite test may be made once a month,

Wells Richardson & Co.'s Improved Butter Color

THE BEST IS ALWAYS CHEAPEST

"THE KIND THAT HAS NO MUD"

can always be relied upon as the BEST, being UNIFORM, free from all SEDIMENT, and NEVER becomes RANCID. It is for sale by All First-class Dealers.

AN ENEMY TO SOCIETY

That man, or that institution, which will willfully sell adulterants and poisons to the public is an enemy to society and should be so regarded. This practice obtains in a very large degree in many varieties of food, but we are interested principally in protecting the public from poisonous butter colors. We are manufacturing a perfectly pure and harmless butter color

Thatcher's Orange Butter Color.

It imparts that rich "June grass" color and is a purely vegetable compound made from annatto. The man who makes a poisonous color does not publish its contents. He is afraid to. Most poisonous butter colors are made from coal tar and are so called analine dyes. Excellent for coloring cloth, etc., but dangerous and destructive to the human stomach. Don't use them. Use only pure color—Thatcher's—and earn an enviable reputation for the uniform color and purity of your butter. Every drop guaranteed free from any deleterious substance and guaranteed by the manufacturers.

Send for Sample and Full Information.

THE THATCHER MANUFACTURING CO., Potsdam, N. Y.

Gluten Feed is used by nearly all successful dairymen, and has become a necessary article for any dairyman farmer who wishes to keep pace with the successful men in his line of business.

Gluten Feed increases the flow of milk, improves the quality, keeps the cattle in the best possible condition—in fact, helps you make more money out of your dairy. This is not cheap talk. We mean business. Gluten Feed is all and more than we claim for it, and, best of all, a trial proves it. Sample of Gluten Feed, Milk Talk Pamphlet, and circular illustrating the "Value of Butter Fat in Milk," all FREE if you address

FOR SALE.

Wishing to retire from business, will sell one hundred (100) cows, farm and fixtures, at a bargain. Buildings nearly new, with running water, and the highest price market for all milk raised.

Address A. B. FARMER, Lyons, Somerset Co., N. J.

and yield of butter fat for the month compounded and recorded.

A careful record should be kept of the yield and test of milk from each cow throughout the season; in this way only will it be possible to study the individuality of each cow as a producer. An occasional test or two shows the quality of milk given at that time only, and is of very little practical value as a guide, nor is the test without the weights or vice versa a reliable indication.

The scales and tester should go together, hand in hand, throughout the season, and the results will point out among other things the cows which can be kept for profit as well as those which are a constant source of loss to their keeper.

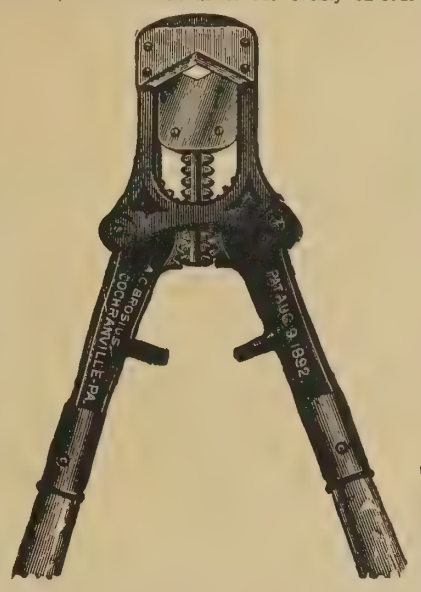
The matter of selection of cows for breeding purposes will also be rendered comparatively easy. In fact, a thorough knowledge of individuality will give the thoughtful, observing dairyman a large scope for improving his herd from time to time until each animal becomes a source of profit to him. As an eminent writer says: "The interest and pleasure of building up a herd from a few well selected animals is very great, and if the breeder will form an ideal picture in his mind's eye of a perfect animal, and follow it up with patience in spite of disappointments and inevitable drawbacks, though he will not be likely to attain perfection, he will, in due time, be certain to possess a valuable herd profitable to himself."

There is one consideration, however, of which we should not lose sight, namely, that unless the milch cow is well fed and cared for right along, and, as it were, given every opportunity to do good work, not even such otherwise infallible evidence as the scales and the Babcock tester can indicate her capacity for milk and butter production. They simply show the returns she makes for the care and attention she is receiving at the hands of her keeper.

Raising the Dairy Calf.

To make a good cow from a good calf two things must be guarded against, and they are, a lack of food to make a proper growth, and the use of such food as will fatten instead of building up the frame and muscular system. The skim milk fed calf will usually make a better dairy cow than one that is allowed to suckle the old cow, if sufficient pains is taken to give the skim milk at the right time and of a proper temperature, for two reasons; it does not put on so much fat while young, and it does not feel the change so much when the milk is taken away, and it is made to live upon grass or hay. The latter is, however, in part due to the fact that, as the skim milk is thought of little value for other purposes, its use is generally continued until the calf is three or four months old, when it is well able to eat and digest other food, while those who let the calf continue sucking its mother, feel that it is costing too much, and want to wean it at six weeks old, or sooner.

If the calf lays on fat while young, it seems to acquire in some way the peculiarity of the digestive organs changing all the food to fat, and when it becomes a cow it cannot be fed liberally for the purpose of increasing the milk without fattening up at once and giving less milk than before. In this respect at least the overfed calf is likely not to make as good a cow for milk as the one that has been underfed. But the latter is likely to be undersized, and with digestive powers weakened by the course of starvation, and it is only by a long course of judicious and careful feeding that it can be brought to the form it should have had.



We clip the above from the *American Cultivator*, not as something new, for HOARD'S DAIRYMAN has advocated this doctrine for years, but as indication of the fact that right ideas are becoming more and more popular.

This is the way Professor Robertson, the Commissioner of Agriculture for Canada, describes what he calls a good "business cow:"

"Her power of service will be indicated by certain external points. She should have a large, long udder, of elastic, fine quality; a mellow, movable skin covered with soft, silky hair; a long, large barrel, hooped with flat ribs, broad and wide apart; a broad loin, spreading out into broad, long hind quarters; an open twist, with rather thin hips, and a lean neck of symmetrical length, carrying a clean cut, fine face, with prominent eyes. A cow with these points, has ability to serve a man well if she gets a fair chance. That her calves may have powers equal to or rather better than her own, care should be exercised in their breeding. The best blood of the breed adapted to the farmer's purpose, should be used to enlarge, and not to lessen, the working capacity to be transmitted to her calves."

ILLUSTRATION.

This knife, which has been regularly advertised before our patrons for several years, was invented and is being madufactured by Mr. A. C. Brosius, Cochranville, Pa. Its strongest feature is in the peculiar shape of the cutting edges or blades, which, as will be observed from the cut here shown, are so formed as to cut evenly on four

sides at once. The form of knife, together with the powerful levers, are responsible for a quick, clean cut, obviating entirely the cruel and painful operation of the straight, rotary or shear principle knives, which always result in more or less crushing and bruising of the horn. This was the dehorner that took highest award at the World's Fair at Chicago in competition with the best similar devices then made. Like most good things the Keystone Dehorning Knife has a host of imitators, and the inventor has been obliged, in a number of cases, to proceed by process of the law, to protect himself. As the law makes the purchaser equally guilty with the infringer of the patent, we would advise our patrons to buy only the genuine and original machine in all such cases.

Write the inventor, as above, for catalogue, prices, etc.

The story of love is as old as the world, and as all embracing as the universe. It furnishes the sentiment for all romances—all novels—all plays.

The novelist considers it wholly from the sentimental, intellectual side, but there is another aspect even more important—the physical side. Sentimental love between men and women leads to close physical association—to marriage—to the rearing of children. And so health must be considered. A weak, sickly, head-achey, back-achey woman cannot be a good, helpful wife. She cannot bear healthy, happy children. She cannot give her children the proper care and training.

A sick woman has no right to marry. A sick woman has no right to attempt motherhood.

But no woman need be sick unless afflicted with cancer. There is a sure way for her to regain her health. She need not go to a local doctor and submit to the disagreeable questionings, "examinations" and "local treatments" so invariably insisted upon, and so justly abhorrent to every modest woman.

Dr. R. V. Pierce, of Buffalo, N. Y., has cured more cases of female weakness than any hundred local practitioners. He has proved that diseases distinctly feminine can be cured right in the privacy of home.

Write to him stating your symptoms and an account of your trouble and he will give your case careful, confidential consideration and prescribe for you free of charge.

Mrs. O. N. Fisher, of 1861 Lexington Avenue, New York City, writes: "I had been a sufferer from nervousness with all its symptoms and complications. In the spring of 1897 I began to take Dr. Pierce's Favorite Prescription. Now I am not cross and irritable. I have a good color in my face and have gained ten pounds."

Census of Dairy Products.

The attention of dairymen is called to the following circular from the Director of Census for 1900. The value of this work will depend largely upon the amount of information which dairymen and farmers are able to supply to the census enumerators when they call.

Dairying is one of the greatest industries of the country, and deserves that a complete record be made. To assist as much as possible in this work, we request that the readers of the DAIRYMAN, beginning with Jan. 1, 1900, keep an accurate account of the total yield of milk they obtain from their animals, together with the returns from the manufactured product. The other manufacturers of the country will show their importance by imposing columns of figures, and while we know that dairying is of greater value to the country than many more pretentious lines of business, yet it will not take its proper place unless the takers of the census have the help asked for in the following circular:

The law requires the statistics for the Twelfth Census of dairy products (farm and factory) to be taken on separate schedules.

The Division of Agriculture will take the amounts of milk and cream produced and sold, and the amount of money received from their sales; also the quantity and value of all the butter and cheese made on the farm.

On the manufacture schedule will be taken the quantity of butter and cheese made in factories, co-operative and otherwise, together with the quantity and cost of raw materials (milk and cream), cost of labor, capital invested, character and value of plant and machinery, etc., etc.

After the two forms of schedules shall have been returned to the Census Office in Washington, the like statistics of dairy products on each will be consolidated, and thus show, what never heretofore has been shown, the total yield of milk in the United States, and the amounts and values of its several products.

This assertion is based on assumption that the farmers shall furnish to the enumerators, fully and accurately, the information which the schedules may call for.

In some sections the records of cheese factory and creamery operations for the current year are destroyed, agreeably to previous vote of directors or patrons. For 1899 they should vote, instead, to have prepared and preserved for the use of the Census enumerators, who will appear on June 1, 1900, the statistics which the law says shall be gathered.

In many cases a failure to do this will prevent the enumerators from securing any returns, because new managers, or new secreteries, or new boards of control may be in charge on June 1, 1900, who will know nothing of the factory statistics of 1899—and the figures for 1899 are the ones which the law says shall be taken.

Farmers who keep no records of their transactions will find themselves in the same dilemma, on the arrival of the Census enumeraor, as a factory which destroys its records. Therefore, Chief Statistician Powers is appealing to all of them to prepare in writing, while the necessary facts are fresh in mind, such a statement of milk, cream, butter and cheese products as will enable them to reply promptly and accurately to the inquiries which the law says the enumerators must make.

If they shall fail to do this, the statistics of dairy production of their county will be incomplete, and will compare unfavorably with those of counties wherein the returns are more accurate.

Care of Dairy Cows.

[Paper read at the Missouri State Dairy Association by G. M. LAMM, Sedalia, Mo.]

I have divided my subject into two parts, and will treat each part separately:

First Part—Care of dairy cows for their physical comfort.—The amateur in dairying often lavishes money on expensive barns, beautifully painted, and constructed with magnificent proportions; but I have found that comfort can be secured without grand architecture, and even without costly expenditures.

A cow wants a soft, warm bed in winter, clean and fresh, and she cares but little whether her bed be leaves, straw or sawdust. That is left exclusively to the resources of her owner. Her nervous disposition requires protection from extremes in heat and cold.

Her great distended udder will not allow of abuses, or of long journeys at rapid motion, but of tender treatment when drawing the milk and taking her to and from the pasture.

She is taxed to her utmost in loading the milk with every element necessary for a perfect human food, and excitement disturbs and often retards the process of the perfect elaboration of the milk. During rumination and when secreting the milk the cow demands quiet and comfort.

Easy going management and tender and almost affectionate treatment from youth to age, are most conducive to the development of that domesticated nature of the cow which is so much in harmony with our country home life.

The great draughts of pure water, which her wants demand, disturb less the equipoise of the wonder working processes of her stomach when tempered in winter to about 50°.

Her foods are relished best in the absence of the festive fly, but she loves the sunshine and shadow, and is not disturbed by the summer breezes and gentle showers.

In winter she seeks the southern exposure to bask in the sunshine for awhile as though there was healing and restoring properties in its rays for her intricate and heavily taxed nature. In this climate, luxury should always be allowed her, and the dairyman who appreciates the ability and vitality of this noble animal seeks in every way to protect her from inclement weather, muddy barn yards, and the cruelty of every enemy, and give her especially the luxuries, pure air, water and sunshine, which nature affords in abundance.

Second Part—Care of dairy cows for profitable results.—While the kind hearted dairyman loves to see the marked features of docility, gentleness and beauty perfected in every individual cow, and while his heart rejoices to know that they are cared for tenderly by night and by day, yet he also studies the properties of foods, grains and grasses, so as to supply the cravings of their appetite with such food as may give him the largest possible returns.

He mixes the food for his cows with a master's hand, often deeming it necessary to sell the dairy food that he raises on his farm to buy what he needs, in order to give her variety and a well balanced ration. This sometimes insures the largest returns for the least money expended, and he knows, or should know, when a cow has the proper food and a fair chance to do her best.

He harvests his crops at the time when they will do the most good, and then feeds her with a liberal hand.

He avoids the ruinous effects of cows hooking each other by removing the bud of the horn from the calf. This practice has saved the life of many a valuable cow, and more valuable men, and has solved the question of economy of stable building and protection of the weak from the strong. He has his cows come fresh when dairy products will answer best the demands of his market, and saves the waste of over production.

He feeds and milks and salts his cows at regular intervals, because this brings the largest returns, as well as relieves the cow of anxiety. I have seen cows painfully restless because the milker was an hour late. The cow possesses her own devices to get even with negligence and cruelty, and rewards richly every kindness.

The good milker approaches his cow with a kind word, and knows how to press the teat against the palm of his hand with the end of his fingers, so as not to injure the cow or make her feel uncomfortable when yielding her milk.

While I would have the best possible environment for my cows, yet I would not feed too high, or give too fine or too rich foods, for my experience has been that it weakens vitality, and impairs powers to transmit ability to her offspring. She needs from forty to eighty days' rest every year, and will take her rest as a man takes his, on a vacation and good things to eat. To care for a dairy cow properly, or to tell others how to care for her properly, one must know her habits, her capacity, her surroundings, the climate she is kept in, and what special breed she represents. All these may be known; if she is a good cow, he can make of her a valuable acquisition To know these things is to study a living subject of vast importance to every home, community or state.

From the Tennessee Experiment Station.

ED. HOARD'S DAIRYMAN:—A correspondent writes thus: "May I have the pleasure to ask you for bulletin 47. I read an account in the HOARD'S DAIRYMAN, and it suited me, and I learned a good deal out of it. If there is any postage let me know, and what the bulletin will cost."

The bulletins of the Tennessee Experiment Station will be mailed free on application. There seems to be an idea among our farmers that a charge will be made for these bulletins, and this note is simply to notify them that such is not the case, and that when we issue any publications that are of interest to farmers in Tennessee or outside of the state, we will be glad to supply them with a copy until the edition is exhausted.

Knoxville, Tenn. ANDREW M. SOULE.

Skim Milk.

[A Paper read by I. T. DUTTON, before the Farmers' Institute at Portis, Kansas.]

Skim milk seems like a thin subject to discuss before this audience, but we are going to show you that there is money in it, and that makes any subject interesting.

It seems like begging the question on the start, to say that Nature, in the whole new milk furnishes a perfect balanced ration, which we may imitate but cannot excel; and it is wonderful the growth the young animal makes when fed it; but Nature is liberal, not to say prodigal, and now-a-days it won't pay to follow her entirely.

In the good old days before the creamery, when butter was worth five and six cents a pound, made it yourself and hauled it to town and traded it for stuff, it might have paid better to feed the milk to the calf.

But with the coming of the creamery the conditions have changed. Milk has now a value in cold cash, and if we don't look out we will feed more dollars into our calf than we can get out.

Let us figure a little. Butter fat at this station is now worth fifteen cents a pound. It ought to be worth more. (butter in Kansas City brings twenty-one cents a pound.) And it would be worth more if you good people would get a hustle on you, wake up the haulers and send your milk to the creamery.

It has averaged 14.8c since January. It is worth fifteen cents a pound. Four per cent milk, that is milk with four pounds of fat to 100 pounds of milk, is worth sixty cents per 100. A pail of milk weighs twenty pounds, one-fifth of 100, and is worth one-fifth of sixty cents; that is, twelve cents. A pail of milk is worth twelve cents.

A calf will drink a pail of milk a day for three months, or call it 100 days, to figure easier. He won't take that much at first, but will average it for 100 days. That costs us twelve cents a day for 100 days, or $12, and he ought to be fed once a day for another 100 days, which makes $6 more, making him cost at six months, or 200 days, $18. He is a nice calf; coat shining and sleek, and he is fat; he ought to be; he has $18 inside of him.

But that is not all the cost. It costs something to keep a cow. Call the cow worth $35. The interest on the investment is $3.50, and surely it is worth $6.50 to keep a cow a year, making $10 more. Now we are out $18 on the calf and $10 on the cow, making $28 and only the calf to show for it for the cow will dry up as soon as you wean the calf.

And now comes the weaning and now the fun begins! The cow and the calf will get together sometimes, and the air gets full of words not found in the dictionary. Something seems to be happening, and general pandemonium reigns.

Let us yank the calf off his mother, tie him to a post, fix up the fence, and let him stand there while we look after another kind of calf.

We are going to try another plan with this calf. We are going to feed him skim milk, and send her milk to the creamery. Skim milk is worth nominally 15c. per 100 pounds. Nobody has any to sell, and nobody buys, the experiment station giving it a nominal value of 15c. per 100.

We will feed this calf a pailful a day for 100 days. It is worth 3c. a day.

But the separator has taken out the butter-fat, worth 12c., and we must replace it, for we are not going to work against Nature. It

A PECULIAR REMEDY.

Something About the New Discovery for Curing Dyspepsia.

(*From Mich. Christian Advocate.*)

The Rev. F. I. Bell, a highly esteemed minister residing in Weedsport, Cayuga Co., N. Y., in a recent letter writes as follows: "There has never been anything that I have taken that has relieved the Dyspepsia from which I have suffered for ten years except the new remedy called Stuart's Dyspepsia Tablets. Since taking them I have had no distress at all after eating and again after long years can sleep well. Rev. F. I. Bell, Weedsport, N. Y., formerly Idalia, Colo."

Stuart's Dyspepsia Tablets is a remarkable remedy, not only because it is a certain cure for all forms of indigestion, but because it seems to act as thoroughly on old chronic cases of Dyspepsia as well as in mild attacks of indigestion or biliousness. A person has dyspepsia simply because the stomach is overworked, all it wants is a harmless vegetable remedy to digest the food and thus give it the much needed rest.

This is the secret of the success of this peculiar remedy. No matter how weak or how much disordered the digestion may be, Stuart's Dyspepsia Tablets will digest the food whether the stomach works or not. New life and energy is given not only to the stomach but to every organ and nerve in the body.

A trial of this splendid medicine will convince the most skeptical that Dyspepsia and all stomach troubles can be cured. Send for little book on Stomach mailed free by addressing F. A. Stuart Co., Marshall, Mich. So popular has the remedy become that Stuart's Dyspepsia Tablets can now be obtained at any drug store at 50c per package.

GUERNSEYS FOR SALE. The increase of my herd is a few young things of both sexes, from one to eighteen months old. Prices corresponding to age and quality. **F. W. TRATT, Whitewater, Wis.**

Riverside Guernseys,
CHAMPION Herd
AT NEW YORK STATE FAIR,
1898, in competition with the leading herds of the country, won eight firsts and sweepstakes. Young stock by **COMUS**, sire of most of the winners, for sale. Thoroughbred Poultry—the best egg-producing and general purpose varieties—Leghorns, Wyandotts, Buff Ply. Rocks, Houdans. Send for circular. Stock for sale. **J. FORSYTH,**
Riverside Farm, **Owego, Tioga Co., N. Y.**

GUERNSEY CATTLE

The Old Homestead Herd has more than duplicated its record of last year, at the Ohio, Ind. and Ill. State Fairs again in 1899, winning not only over two-thirds, but three-fourths of all prize money offered on Guernseys at the above fairs. This herd was not defeated at Wis., as might be your impression from the report of awards, but was withdrawn in the third ring, yearling bulls, on account of what I regarded as an unfair combination on the part of Wisconsin's Judge, Ass't Superintendent and an exhibitor. The Assistant Sup't of Dairy cattle being an exhibitor in his own department, contrary to the Society's printed rules, and receiving on his yearling bull an unmerited award from a judge who was his intimate friend. L. V. AXTELL, Perry, Ohio.

ROSENDALE
GUERNSEYS

Our herd has won first prize at the Wisconsin State Fair every year since 1894, and also won first at Minnesota State Fair and at the Trans-Mississippi Exposition in 1898. We keep only 400-lb. cows. Tuberculin tested.
GEO. C. HILL & SON, Rosendale, Wis.

"Florham" Guernseys.

First Prize Herd wherever shown, viz: New York State Fair, 1895 and 1897; Bay State Fair, 1895; Inter-State Fair, Trenton, N. J., 1895 and 1897; Madison Square Garden, 1895; New Jersey State Fair, 1897. **J. L. HOPE,**
Farm Supt., Madison, N. J.

would'nt pay. So we take a little oil meal, worth 2c. per pound, and a handful of shelled corn, worth not 3-10 of a cent. A pound of oil meal will last several days. But we will call the whole business worth one cent a day, and mix it in our skim milk to make up for the stuff we sold at 12c.

That makes our feed cost us 4c. a day, and in 100 days makes $4, and another 100 days once a day, $2 more, making $6 the cost of our skim milk calf for six months.

Now we have some more cost, as in the case of the other calf. Our cow costs us for the six months $5. We say six months because she is still in profit—still giving milk worth 60 cents per 100; don't know anything about a calf, and will at least pay for her keep the next six months.

Now we have to figure up our balance on this transaction. We didn't have any balance to figure up on the other calf; we were out $28, and only the calf to show for it. This calf cost us $6; keep of cow and interest, $5; total cost, $11.

But what became of that 12 cent butter we didn't feed the calf?

Why, we sold it to the creamery and got our cash every month on the company's check, good for its face the county over. And how much was it? Twelve cents a day for 200 days, or $24 in cold cash. Take from this our cost, $11, and we have a nice cash balance, $13, and a good calf clear, and he is a good calf. Maybe not so fat or sleek as the other, but he knows more, has plenty of good bone and muscle, and looks able to buck the storms and cold of the coming winter.

The other calf being raised a pet and set back by his weaning, will have all he can do to hold his own, and by the time they are yearlings past you can't tell them apart; if anything, your skim milk calf is ahead.

When we say skim milk we mean the pure stuff, fed warm and sweet.

Not one day cheese, the next whey, the next one-half water, and the next none at all (the hauler forgot our can), but always the same, warm and sweet.

In this shape, with the addition of a little oil meal and shelled corn at nominal cost, we contend that it equals the whole milk as a feed for the growing calf, and it is much more economical.

We have forgotten the pig in our talk, but the same argument holds good in his case.

Analysis teaches us that the separator takes out only the fat, leaving the bone and muscle making ingredients still in the skim milk.

Using a Milking Tube.

The milking tube has a place on every dairy farm, and its place is to use only when it is impossible to milk a cow with the hand. A few years ago, instrument makers advertised them extensively, and some even recommended them for general use in milking any and all cows that were hard milkers, or those that had sore teats. This was a great mistake. Theoretically a milking tube can be passed up a cow's teat, and the milk will run out to some extent. But there was always a little left. The old cow has a little cow sense, and she won't be fooled entirely by any scheme that has thus far been devised by man. She wants to have her udder manipulated to some extent, as the calf would do in drawing the milk, and when this is not done, milk is not manufactured. Much of the milk is made during the time of milking, and unless there is some motion going on about the udder, the old cow practically says: "Nay; there is no one working at my udder to get milk, so I won't make it." This has been the great trouble, not alone with the milk tube, but with all milking machines. The cow kept yielding less and less, until in a few days or weeks, she was dried off.

There is another reason why milking tubes came into disrepute. They were improperly handled; cows' teats are of far different size and length. A milking tube three inches long was frequently run the whole length up a two-inch-long teat; the udder was injured at the base of the teat, and an inflammation followed, which sometimes ruined the udder.

Again, some neglected properly to clean the tube; germs accumulated upon it, which, when they came in contact with the sensitive membrane of the milk channel inflamed it. Dirty hands also handled it, and the tube, although it had once been well cleaned, contained irritating germs when it entered the teat. Nevertheless, the milking tube is sometimes needed, and there is seemingly no way to milk a cow without its use, when she has cow pox, or she has in some manner injured one or more teats, rendering it impossible to draw the milk by the hand. Then is the time, and the only time, that a milking tube should be used, and its use should be stopped just as quick as the emergency of the case will permit. Before using, always dip in a little hot water, then in a little pure olive oil, and carefully insert up the teat, using judgment as to how far it should be inserted. During the time it remains in the teat, with the hand gently rub and squeeze the quarter, thus causing the regular amount of milk to be secreted and brought down into the milk cistern, when it will pass out through the tube. Used when necessary only, and used properly, a milking tube made of silver, or hard rubber, is of great value to use in emergency cases, but for general use, or if carelessly handled, it is worse than useless.—C. D. SMEAD, in *Rural New Yorker*.

CONCERNING OUR ADVERTISERS.

"CLIPPER" WELL DRILLS.

The catalogue of the Loomis "Clipper" Well Drilling Machines, made by Loomis & Nyman, Tiffin, Ohio, will interest every one who has occasion to drill for water, oil, gas or coal, or those who may contemplate entering the business of drilling. The "Clipper" drills have done good work in all kinds of soil and under all conditions and their claims to superiority are backed up by the testimony of successful users of these machines. The makers claim that the "Clipper" is strongest, requires least power, carries the heaviest tools, drills faster, lasts longer and earns more money than any other. Loomis & Nyman make many kinds of drilling machines for use with horse, steam or gasoline power. They will send their catalogue anywhere on request.

There is an advertisment in the DAIRYMAN announcing the annual sale of Jerseys at Nashville, Tenn., Nov. 9th. This sale includes the Morgan & Brown and Woodard herds, and of the animals to be offered at sale we are written as follows:

"Two of Tennessee's best Jersey herds will be disposed of at the closing out sale at Nashville, Tenn., Nov. 9th. The public get the benefit of such dispersal sales, as they know that there is more than culls offered. In this lot will be found more of the blood of Bisson's Bells and Landseer's Fancy than can be found any where. In fact more of Tennessee's famous blood—almost every pedigree is a combination of Lord Harry and Tormentor—that produced Etheel 2nd, 30 lbs. 15 ozs., at 2½ years, the richest officially tested cow.

You will find Tormentor, Fancy's Harry, Lord Harry, Denise's Tormentor and Toltec crossed on such cows as Bisson's Belle, Landseer's Fancy, Ethleel, Oonan and Duchess of Bloomfield, at every glance at the pedigrees of this catalogue.

Such cows as Bisson's Belle, Fancy's Pet, Ethleel 5th, Landseer's Fancy 3rd, Maquilla 4th, and a number of others I could name in this lot could not at any other time be bought at all.

I am sure this sale will attract breeders who have not been buying any cows, as they can find true foundation stock here. The sale will be under shelter and convenient to street cars and I think will attract buyers.

I think I can say without fear of contradiction that such desirable pedigrees as are found in every branch of these charts in the same number of animals were never brought together."

L. V. Axtell, of Perry, Ohio, owner of the "Old Homestead" herd of Guernseys makes explanation of his withdrawal from the third ring at Wisconsin State Fair in his advertisement. The reports of the exhibitors and award of premiums may have left some readers with an impression of the Homestead herd not warranted by the facts. Hence this explanation. This herd bears an excellent reputation and having many animals of much merit that could well stand in any ring to await the judges verdict.

The Freeland Manufacturing Co., of Niles, Mich., make their announcement for the fall and winter seasons in this issue of our paper. Their advertisement will be found on another page. As will be observed from the ad. these people are making a drive on their Galvanized Steel Tank, Feed Cookers, and Tank Heaters.

In commendation of these people we must say, that they show a disposition to deal fairly with the public, as they say in their ad. in bold type, "Shipped subject to inspection." Nobody need buy any of their goods, therefore, without knowing exactly what he is getting. Write them for circulars, prices and terms to agents.

VETERINARY.

Queries in this department answered by WM. HORNE, M. D. V. S., Janesville, Wis.

COW PHYSIC—Three-fourths to 1¼ pounds Epsom Salts (according to age and size of animals) and two ounces of best ground ginger. Pour over this three pints of boiling water. When at 105° F., give gradually as one dose.

PARALYSIS.

I have a heifer, two years old, with following syptoms. She reels when she starts to walk and goes sideways as though she was weak in the back; humps her back when she walks and stumbles with front feet; eats very well, but would rather eat old dry grass or leaves or butts of corn stalks than good hay; she does not chew her cud much, and she seems stiff at times; she don't seem to fall off much, but has a staring gaze out of her eyes at times; she has been this way about one week. I gave her salts and saltpetre and it seemed to help her for a little while, but the next day it was as bad as ever. J. C. R.

Mexico, Mo.

ANSWER.

Symptoms being correct, you have a serious case. To me it looks like paralysis of the lumbar process, and it is always a difficult disease to treat, and is also a very intractable one. Give her one dram of pulverized nux vomica each morning for two doses only; rest two days then give half a dram of nux vomica and half an ounce of fluid extract of golden seal, in three ounces of old whiskey and four ounces of water; one dose a day for three days, skip three days, then repeat every third day for two to four doses. Rub the lumbar region hard with oil of cedar two ounces; sulfuric ether, one ounce; oil of origanum, two ounces; fish oil, six ounces; keep tightly stoppered, out of the sun, in a cool place. Shake violently before using each time. Rub hard once a day.

EYE DISEASE.

All my animals had much improved by the time I got your prescription, and had all regained their sight, but one of them, one of the first ones sick, seems to have taken quite a different course to the rest of them. The left eye is quite closed up, and some matter comes from it and it is quite hard and tightly closed; also underneath the skin is a very hard substance, that is not connected with the bone, muscles or skin, and it is gradually increasing in size. In all other respects the cow seems all right, that is she does not moan or show any signs of pain, and eats well. It is impossible to open the eye; it seems as hard as bone, but we bathe it in hot water, and grease it to try to soften. Would be glad to know if I can do more for it, or if it would do any good to use the liniment outside the eye in place of lifting the eyelid and squeezing into the eye as you said.

Fredericksburg, Texas. W. W. C.

ANSWER.

Don't use the liniment outside. It is not for such. I don't think you have a flattering case of cure. I can't justly diagnose your case, as given, but I can say, I am afraid you have a hopeless case. You need a practical man to make a personal examination, *at once*, and act accordingly.

TROUBLE IN BREEDING.

I am having trouble with my cows. They are regular until they are bred, and then they go from four to six weeks before they come in season again. Then they are regular again until bred, and then are irregular. I feed them alfalfa hay, corn fodder, corn meal and bran, salt twice a day. They appear to be healthy. The corn fodder has considerable smut on it. Would that make the trouble? N. S. S.

Gardena, Cal.

ANSWER.

Yes, smut is the agent of many peculiar diseases and deaths. In your case I doubt not, it is the sole cause of trouble. No intelligent man will allow smut to get into any animal's stomach, if he can prevent it.

Horse Owners! Use GOMBAULT'S Caustic Balsam

A Safe Speedy and Positive Cure

The Safest, Best BLISTER ever used. Takes the place of all liniments for mild or severe action. Removes Bunches or Blemishes from Horses and Cattle. SUPERSEDES ALL CAUTERY OR FIRING. *Impossible to produce scar or blemish.*

A CALIFORNIA DAIRYWOMAN AND HER HERD OF COWS.

No matter whether it be in Maine or California, when good dairy intelligence and good cows come together, there we see a profitable result. Miss M. D. Eshelman, of Fresno, California, in an address to the Dairy Association of that state, gave the following account of her herd of cows:

The herd made in 1897, an average of 339 pounds of butter. In the present year the herd has averaged 318 pounds, the record being lowered by the fact that seventy-nine heifers came in during the year. These records include every cow that was milked during the period, including cows since turned off for beef. A goodly number of the older cows made over 400 pounds, and a few went over 500 pounds, and our best cow's record in 1897 was 573 pounds of butter and this year she has made 629 pounds.

The success of the ration depends on its palatability, and if it is lacking in this particular carefully balancing it will not make the cows eat enough to increase the milk flow sufficient to cover addititonal expense. Cows are like ourselves in preferring pleasant tasting foods. Rancid butter contains the food elements of the sweet creamery butter, yet, with the help of all our reasoning faculties, we could not find it desirable enough to eat freely. The cow will only produce well when she likes her food and her home.

Dairy Diversification.

The Rockdale, Texas, Meeting.

ED. HOARD'S DAIRYMAN:—The writer recently visited the Rockdale community, and enjoyed an opportunity to meet some of her enterprising citizens, and especially to look into the dairy interests that have recently developed in that locality. All other portions of south Texas have experienced trouble in making good butter during the summer season without ice, for creaming, or churning. But some have succeeded, at Rockdale, in making high-grade butter without even the assistance of cool water.

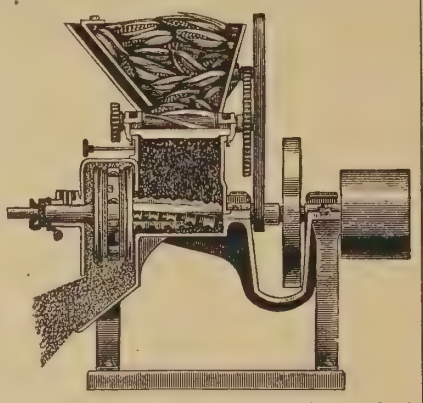
Golden, granulated butter, free from milk, and sweet at three weeks old, was shown before a crowd of some seventy-five practical farmers and their wives. This butter, produced when September temperatures were 90° to 95°, (maximum) was the product of those who had received no special training in butter making, and who stated to me that their success was due to the use of a cooling system, which was invented and put upon the market by Mr. L. H. Porter, of Rockdale, and which is probably familiar to those reading the advertising columns of our agricultural papers. This butter sells in Houston for 20 cents per pound.

After spending a day most profitably and pleasantly for me, I felt impressed with the signal success of this infant industry at Rockdale, and was gratified to learn of the esteem in which the people of his home community hold Mr. Porter's cooling system.

Out of some one hundred pounds of sample butter shown, a number of the makes were not up to the standard in grain, or bore evidence of too much churning, over working or use of improper feeds. Such errors in handling can soon be removed, if the people interested, will give these matters studious attention. For those who desire to improve in methods, I recommend the purchase of one or both of these books, "Milk and Its Products," by Wing, or "The Chemistry of Milk," by Snyder. Every butter maker should own one of these little books.

In addition to the butter display, an excellent piece of Milam county cheese was shown and freely sampled. During the afternoon an exhibition of a hand separator at work, and of milk testing and cheese making machines was given, in which the uses and processes were fully explained to the interested onlookers.

While in the town only a short time, I found that there were enterprising newspaper men and merchants, who were anxious to help the farmers of that section, to a reasonable diversification, and who felt an intelligent and unselfish interest in the welfare of Milam county, and her undeveloped resources. J. H. CONNELL.



College Station.

ILLUSTRATION.

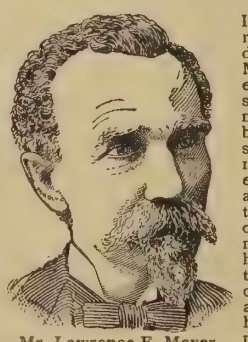
KELLY DUPLEX GRINDERS.

The "Kelly Duplex Mill" shown herewith, is manufactured by O. S. Kelly Co., of Springfield, Ohio. It has been before the trade for so great a length of time, and has proven so satisfactory that we cannot refrain from giving it a word of recommendation at this time. We believe that this is the only mill which, as is indicated by its name, has duplex grinders or buhrs.

This is really a much greater advantage than might at first appear, for it means that the grain

is ground twice at a single operation. Indeed we think that the Duplex must be the best representative among feed grinders of the now universally accepted gradual reduction process of grinding.

First of all, it has a system of breakers, which break up the corn and cob, dropping it to the bottom of the hopper where it is again further crushed and reduced in the process of being fed into the Duplex grinders. This means that there are really four gradual reductions from the whole ear corn to the finished meal.



In addition to the above advantages, this is a strong, durable mill of large capacity, and one well calculated to give satisfaction under almost any conditions. We might just add that the business of the O. S. Kelly Co. has so enlarged and extended that they have been obliged to erect a large factory at Iowa City, Iowa, to better enable them to care for this trade.

Should any of our readers be needing a feed grinder, they will do well to correspond with these people before buying. Ask for catalogue, etc.

Great Rupture Cure

Wonderfully Brilliant Invention Sold at a Low Price.

A Home Cure That is Restoring Thousands to Perfect Health, Many Remarkable Instances.

Mr. Lawrence E. Meyer.

In speaking about his remarkable cure of a dangerous rupture Mr Lawrence E. Meyer of Syracuse N. Y. says: "I tried the method of Dr. Rice because it seemed such a vast improvement over anything else I had used and also combined curative effect such as no other rupture treatment contains. I hadn't much faith in the possibility of a cure but the results are remarkable. I had been laid up for months, but from the day I began the Rice method the rupture did not bother me for a minute. It was only a short time when I couldn't feel any trace of where the rupture had been and I soon was able to work all day as freely as a young man. I advise every ruptured man or woman to send at once and get this method as will certainly cure permanently and perfectly." Mr. Meyer's advice is good. Upon application to Dr. Rice, he will send you free a book that fully explains how he cures rupture. If you know of another person ruptured send and get a book for him. Such an act of kindness will be remembered all the rest of his life. Write today without fail. Address Dr. W. S. Rice, 353 F. Main St., Adams, N. Y. The book is mailed free to all who send name and address.

SMALLEY MFG. COMPANY, Sole Makers, MANITOWOC, WIS.

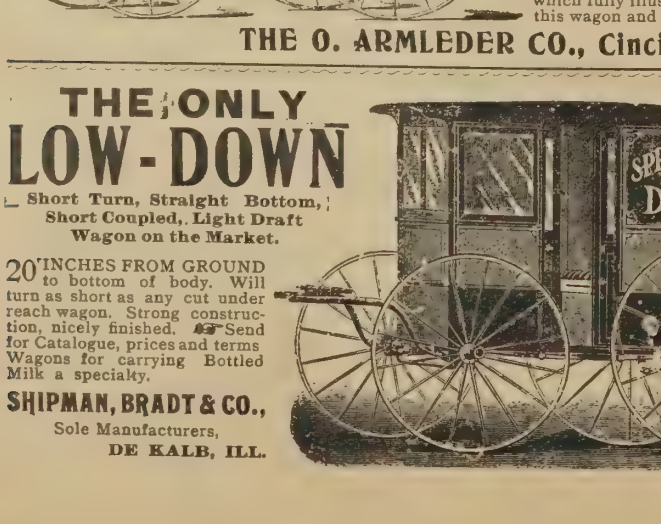
MAKE ONLY

SWEET ENSILAGE

Ever since the ensilage system has been introduced in this country it has been the ambition and effort of siloists to ***produce sweet ensilage.*** The making of sweet ensilage depends principally upon two things—***1st.*** the use of a well matured crop and ***2nd.*** upon low fermentation. Granting the maturity of the crop, shredded ensilage makes the sweetest ensilage. The reasons are, that shredded material is of a nature that makes it pack much more closely in the silo. That means exclusion of air; there can be no extreme fermentation and consequent development of acid without the free action of the air. ***Shredded ensilage possesses other advantages in addition to its sweetness:—*** it is eaten with great avidity by animals, being a long, soft substance and free from any sharp angles and corners to cut or lacerate the mouth and gums; it is therefore fed with less waste.

The best way to Shred Ensilage is with the

St. Albans Ensilage and Fodder Shredder.



It is the Original Shredding Machine and all other so-called shredders are merely imitations of this one. ***It will certainly pay you*** to look into the merits of this proposition and machine before buying. We mail free a pamphlet on the subject.

ST. ALBANS FOUNDRY CO., ST. ALBANS, VT.

HUSK YOUR CORN, SHRED YOUR FODDER, SELL YOUR HAY.

A corn crop may be profitable without saving the fodder, but **it will be twice as profitable if it is saved.** The new method of handling corn saves the entire crop. The new way is to run all the corn through our

JANNEY COMMON SENSE Corn Husker and Fodder Shredder

There can be no dreaded "corn stalk disease" where fodder is prepared with our machine. You can make a great deal of money husking for neighbors. Costs less than a third as much as a thresher, but makes more money.

THE APPLETON CORN HUSKER

Is the only one made which successfully fills the demand for a satisfactory, strong and durable husking machine, low enough in price to be within reach of every farmer.

It excels in lightness of draft and can therefore be run to do a satisfactory amount of work with less power than any husker made. If you want a **husker, sheller, ensilage or fodder cutter, shredder, wood saw, grinder, sweep power, tread power, wind mill,** etc. we can furnish you the best. Our 160-page catalogue will convince you. **IT IS FREE.**

APPLETON MFG. CO., 35 FARGO ST., BATAVIA, ILL.

Yes Sir, The

Tandem Sweep

Equalizes the load; each horse must pull his own share. Great Gain in capacity, speed and comfort. **NO GEARING; NO FRICTION. GIVES YOUR HORSES A CHANCE.** Only one set of grinders needed for all kinds of work. Also make 7 sizes belt power mills; 2 to 25 horsepower.

THE NEW BOOK
Feeds and Feeding

By Prof. W. A. HENRY, Wisconsin Experiment Station.

This book should be in the hands of every stock feeder in the country. Every reader of HOARD'S DAIRYMAN ought to have it. It is a large, well bound book, nicely printed, over six hundred and fifty pages. Price $2.00

Four Yearly Subscribers at $1.00 Each ($4) Will Secure It as a Premium.

Four Yearly Subscribers at $1.00 Each ($4) Will Secure It as a Premium.

Of This Book Hon. JAMES WILSON, Secretary of Agriculture, Washington writes as follows:

"Prof. W. A. Henry, Dean of the Agricultural Department of the University of Wisconsin, has recently given to the American student and the American farmer a work on feeds and feeding. Singularly enough, up to this time we have had nothing along this line sufficiently comprehensive from both the scientific and practical standpoints. We have had very able works from both, but Prof. Henry is the first to combine science with practice, and give us a work that will be of value alike to the instructor in the Agricultural College, to the student who is seeking the principles underlying feeding, and to the practical farmer who feeds.

This publication will take its place immediately in the college library, and ultimately in the private library of every farmer in the land. When the instructor, student or practical farmer inquires where there is a work thoroughly exhaustive of this subject, he can now be referred to Prof. Henry's book.

Sent as above, or will be forwarded, carriage paid, on receipt of price, $2.00.

A Skimming Station Outfit

Will not cost you a very large sum if you buy it from us, and it may mean all the difference between success and failure in your business. We know what is necessary in a first-class skimming station and are prepared to furnish the required machinery and apparatus at a low figure. We will also furnish plans for a skimming station if requested to do so. Don't you know of a point where a skimming station can be operated to advantage in connection with your factory? If you do, now is the time to give it attention. Perhaps some other fellow is figuring on the same place. Do not forget the fact that we are anxious to quote you prices on anything in our line of

CREAM SEPARATORS,
Vats, Churns, Boilers, Engines, Scales, Butter Workers,
Combined Churns and Butter Workers, Gasoline Engines, Steel Tanks, Feed Cookers,
Etc., Etc., Etc.

THE SHARPLES COMPANY,
28, 30 and 32 S. Canal St.,
CHICAGO, ILL.

Superior Commercial Cream

It may not be generally known that the very highest product of a separator is Commercial Cream. Such, however, is the case, and in many sections of this country the quality and value of a separator is gauged entirely by its ability to not only skim clean, but at the same time to produce a perfectly smooth, free-from-froth cream of the proper consistency. In the past all separators signally failed in these essentials and it was not until the introduction of the

Sharples Tubular Separator

that complete success was attained. As a consequence the Tubular sprung immediately into popular favor and is now being used exclusively by the largest shippers of Commercial Cream in this country. It produces with perfect regularity, as the gentleman mentions below, a smooth, "velvety" cream, of proper commercial consistency, and absolutely free from bitter froth and other deleterious properties:

OFFICE OF *Northbrook Creamery.*

NORTHBROOK, PA., Sept. 15, 1899,

P. M. Sharples Esq., West Chester, Pa.,

Dear Sir: We believe you will travel a long distance to find another creamery equal to the Northbrook Creamery in its general arrangement, modern machinery and satisfactory system of operation. Everything in this creamery is the best that money can buy. Your No. 25 Tubular Separator has proven fully capable of performing the work you claim for it, both in quantity and quality. In addition to clean skimming, it produces what we particularly require—a "velvety" smooth cream. It makes little noise, is easily cleaned and continues to grow in favor with us the longer we use it.

Respectfully,
NORTHBROOK CREAMERY,
A. F. SEEBOLD for WM. KELLY, Prop.

This is but one among many others who have spoken in like strong terms of the superiority ot the Tubular. In the butter making creamery it is simply unapproachable, being a very clean skimmer, economical of steam, oil, etc., and requiring no repairs. it is most easily managed and run, easiest of all to clean, and above all—it is absolutely safe and burst proof. Meditate then.

"Always In the Lead and Now Better Than Ever."

THE UNITED STATES CREAM SEPARATORS.

THE Improved United States Cream Separators have been proven by tests repeated from year to year, at all Agricultural Experiment Stations in the last four or five years, to be superior to all other Cream Separators, many tests of the skim milk showing only .01 or .02, and are now still further improved and greatly increased in capacity for

1900 OR THE NEW CENTURY.

All experienced Cream Separator operators concede that the United States is unapproached in thoroughness of separation and perfection of manufacture. All gears are enclosed; Bowl Spindle covered with brass shield; have ball bearings. The most cost is put into their manufacture, and they are therefore better and will wear longer, yet are sold for less than others considering capacity and close skimming—are therefore the cheapest, because the best.

Examine "New Century" Prices and Capacities.

Reading notices, 50 cents per line (nonpariel measure) each insertion

AN exchange tells of a patron of a creamery, who was so anxious to have his milk keep over Sunday, that he salted it heavily. The result was that the cream would not ripen, the butter was off and the churning poor because the cream was sweet. This is exactly what happens when preservatives are used in the milk.

The cream will not ripen for the butter maker, nor the milk for the cheese maker, and a failure is scored in each case.

A growth of the proper kind of bacteria is necessary for both butter and cheese making, and when the factory man is in trouble with non-ripening milk on his hands, he may suspect preservatives and act accordingly.

THE HISTORY OF A TUBERCULOUS HERD OF COWS.

Important and Reassuring Deductions.

The Wisconsin Agricultural Experiment Station, as noted in these columns from time to time, has had a herd of tuberculous cows under its direction for nearly four years and for the later part of this period under its full control. It has been doing in this respect the very thing which HOARD'S DAIRYMAN has insisted was necessary to be done and has contributed a goodly number of demonstrated facts to the limited store of knowledge on this important question. There is much more to learn, and probably always will be, but it is satisfying to have some substantial basis to stand upon in pursuing further investigations. In the early days of the tuberculin test, the scientists went fairly wild, and conjured up from the depths of their imagination all manner of frightful pictures. A good many of them are not yet over their fright as every now and then the pronunciamentos of Boards of Health and State Veterinarians amply attest.

But now comes Prof. Russell, than whom no more patient, accurate and conscientious investigator can be found, and in *Bulletin* 78 of the Wisconsin Agricultural Experiment Station tells us that it is perfectly practicable to build up a herd of healthy animals from one that is badly diseased—not, indeed, by *curing* all the affected individuals, but by quarantining them and taking away their progeny at birth. He has proven that the disease may continue in latent form for years, in many instances, and not affect the usefulness or general health of the animal. He does, indeed, and out of abundant caution, recommend that the milk of such cows should be pasteurized, whether used for human consumption or for feeding to calves, and this nothwithstanding the fact that he has yet to find a single tubercle germ in the milk of any of the tuberculous cows under observation.

This is not all, by any means, neither could we give the whole without reprinting the entire bulletin. Wisconsin readers can obtain a copy of this publication or any other, issued by the Station, by sending a request on a postal card addressed "Agricultural Experiment Station, Madison, Wis." It is quite probable also that a limited number of requests from readers in other states would receive favorable consideration.

A HELPFUL AND PRACTICAL CHEESE MAKER.

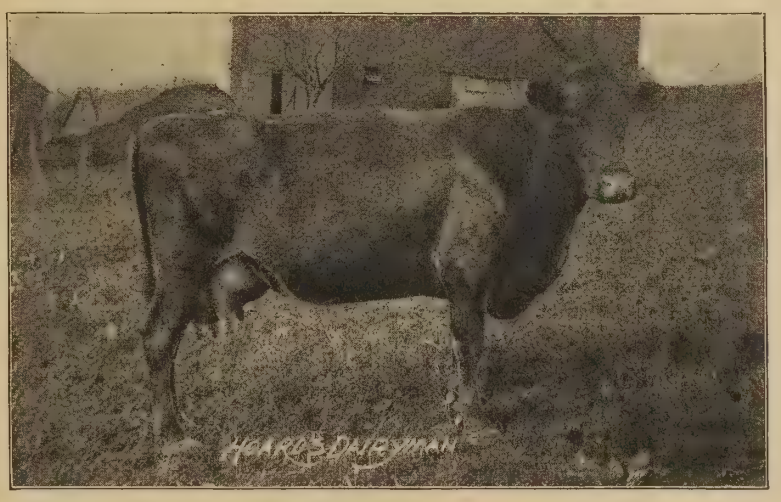
There is no word in the English language more misused than the word "practical." This is particularly true among farmers. We can see men all about us who pride themselves on being "practical," who use the word to measure by, who say this thing, or this man is not "practical," when all the time it was not the practicability of the thing that troubled them, rather their own inability to judge what was practical. For instance, the other day, a dairy farmer said, in our hearing, that it was not a practical thing for a dairyman to use a registered Guernsey bull in a herd where the milk was to be taken to a creamery. He said it would do well enough where a man made up his butter in a private dairy.

That man did not understand the first meaning of the word practical. He was too ignorant and self conceited to understand it. At the same time among the patrons of the same creamery where he delivered his milk, were grade Guernsey herds of cows which averaged their owners double the gross cash and four times the profit per cow that his did.

We have known many hundreds of cheese makers and creamery operators. There is an amazing difference in these, in their practical ability, and especially in their ability to help the community of farmers they live in, to grow and improve in dairying. It is a common thing to see such a man go into a creamery or cheese factory, stay a series of years, and leave it without the slightest indications that they have done the farmers they come in daily contact with, the least bit of good. The farmers have learned nothing from them.

Of an entirely different order of man in his influence among his patrons, is Mr. David Haven, of Hartford, Michigan, who owns and runs a cheese factory. In all his relations there is seen the "practical" or constructive stroke of the man who builds up men and things about him. He sees clearly that many of his patrons are losing money, because they do not have right ideas about cows, and the care and management of cows and milk. He sees that what his patrons need is better ideas in place of poor ones. So he sets to work to boost them into a better order of thinking and doing. He writes a series of articles in the local papers and makes this "practical" proposition:

"The drawing of the milk is by far the largest single item of expense, and we must confess we know of no way to get rid of it; but after due deliberation, we have decided to make the following offer, viz:



The first farmers who will keep 200 cows, take HOARD'S DAIRYMAN, use an aerator, and deliver the milk at the factory without expense to us for at least 300 days in the year, commencing with 1900, we will agree to make the cheese for them for $1.35 a hundred instead of $1.50 the present price. This contract will not be binding on either side unless we get 200 cows pledged, and only the milk from 200 cows will be made at $1.35. We will contract for three years. No one with less than six cows will be allowed to contract. The reason we require the milk delivered without expense to us is apparent. The reason for requiring HOARD'S DAIRYMAN to be taken is that it will make one a better feeder, consequently they will get more milk and more money. The reason for using an aerator can perhaps best be illustrated by actual results. The second Sunday in July we received 3,043 pounds of milk from which we made 322 pounds of cheese. Two Sundays after we received 3,059 pounds of milk from which we made 349 pounds of cheese, or from sixteen pounds more milk we made twenty-seven pounds more cheese. The difference is that the first day was excessively warm, consequently the milk came in poor shape; the last day was cool and the milk was in fine condition; and by using the aerator, and cold water, milk will come in good shape, no matter what the weather is.

The explanation is this, that when the weather is warm and milk that bacteria grow and develop in it faster than when it is aired and cooled when first drawn from the cow; and the bacteria working in the milk destroy the casein or cheese part so that it goes off in the whey. Poor milk makes a light yield but good whey; good milk gives good yield but poor whey. An aerator will pay for itself three times in one year in increased yield of cheese. Let us know at once what you think of our offer of ten per cent reduction in making.

If the farmers see fit to contract to furnish the milk from 200 cows for 300 days in the year, we shall ask them to choose some one to do our figuring at our expense, and to accept an honesty bond from us which will stop any doubt in any one's mind.

Respectfully yours,
DAVIS HAVEN.

Here is a man who is willing to take fifteen cents less on every hundred pounds of cheese, if his patrons will do the few things every intelligent patron should be glad to do. He is hiring them to do the best for themselves. That man is a practical teacher of the principles of sound dairying in his community.

GRADE JERSEY COW.

Property of RAY DUFNER, Fennimore, Wis.

A Grade Jersey.

ED. HOARD'S DAIRYMAN;—I send you a picture of my grade Jersey cow which I think is a very good type of the dairy animal. She has given fifty-one pounds of milk in twenty-four hours which tested 5.1 per cent fat.

The test was made June 28, and the cow became fresh April 4. I have a herd of twelve Jerseys. Four of them are two-year-olds, and two have been milked nearly a year. They are giving three hundred pounds of milk per day and my average test for June was four per cent of fat. I do not think any all-purpose herd in this or any other state can equal them. RAY DUFNER.

Fennimore, Wis.

Inspection of City Milk Supply.

ED. HOARD'S DAIRYMAN:—In one of your late issues I saw a short article relating to the fining of dairymen in Kansas City, Mo., which is a very small affair taking into consideration the magnitude of the milk business. The great need of the present time is the inspection of milk at the farm or dairy where produced, to see how cows are fed, milked and handled, so as to produce a clean, wholesome article. If that was done by competent men, who could issue certificates of the first, second and third class, according to quality, care and cleanliness—it is a notorious fact the barns, milk houses, etc., are the worst constructed, without ventillation or drainage in the district around Kansas City, that I ever saw—and the result would benefit both producer and consumer, and would cause increased demand for the best milk at a much better price. There is another matter that puzzles practical dairymen and others. It is that of people without farming or dairy knowledge, going into the business, expecting to carry it on, without making any provision as to outfit, a supply of good water, etc. It requires as high order of intelligent supervision to run a dairy successfully as any other business.

Kansas City. PRACTICAL DAIRYMAN.

Big Milk Farms.

In the village of Arden, Orange County, New York, 44 miles from New York City, is the Arden Farms Dairy Company, which owns 15 000 acres of land, 5,000 acres of which is tillage. The central portion of the main barn is three stories high, with two wings in which the cows are kept; nothing is stored over the animals; the floor where the animals are kept is concrete; hot and cold water is supplied by a system of pipes; troughs and floors can be flushed with water and kept scrupulously clean. In this barn are kept at all times upwards of one hundred milkers, although 375 cows are owned by the company. The balance of the milkers are distributed in the other barns. When a cow is dry she is sent to one of the outlying farms. The herd is a mixed one, Guernsey and Ayrshire blood predominating. The company sells two grades of milk, one of four per cent, and one of five per cent. Everything is kept scrupulously clean, the cattle are curried and brushed twice a day. The milkers, after thoroughly washing, don a milking suit of white duck and wash their hands after each cow. The milk is strained four times before reaching the consumer. The milking pails have closely fitted covers, with a six inch disc strainer, through which the milk enters the pail. There is a large cooling room and aerator, with cold storage rooms of the most modern pattern. Milk is put up in bottles. The lowest price at which any milk is sold is that which is disposed of in bulk, which is ten cents per quart. Milk in bottles is sold at twelve cents per quart.

This is only one of many similar enterprises that have sprung up near the large cities and seems to show a tendency for the business to drift into the hands of corporations or individuals with sufficient capital to carry it on a high grade plan. As long as the large operators get the extra price that their products secure, the small operator will not be seriously affected, as there will always be a market for the product that does not make any great pretentions to high quality and scrupulous cleanliness, yet the lesson to be learned also shows that there is a large proportion of the consumers who will pay an extra price for a high grade article.—*Up-to-Date Farm and Garden.*

TEACHING THE ELEMENTS OF AGRICULTURE IN THE COMMON SCHOOLS.

Those who were so fortunate as to hear the most admirable address of Hon. C. C. James, Deputy Minister of Agriculture for Ontario, before the late Farmers' National Congress in Boston, must have been forced to the conclusion that our Canadian cousins have thought and worked on this subject far in advance of the conviction which exists in the United States. The address was indeed a most cogent and convincing argument from beginning to end of the great value to the cause of agriculture, the coming farms and the country, of such a system of education, and we hope ere long to lay before our readers a resume at least of its most salient and important conclusions. It will be remembered that Prof. James is the author of a text book on this subject which the DAIRYMAN has spoken approvingly of several times. This book has lately been revised and somewhat enlarged by Prof. Craig, of the Iowa Agricultural College, and is now published by Appleton & Co.

A most comprehensive report on Manual and Practical Instruction in Primary Schools, in Ireland, has lately been issued by the English Parliament, based on the investigations of a Royal Commission appointed by the Lord Lieutenant of Ireland, which with its voluminous appendix furnishes the most exhaustive statement that has yet appeared, of what is being done in the whole world on this question. It would be a grand thing for the knowledge and judgment of the farmers of the United States if a comprehensive summary of this splendid report could be published in every newspaper in the land. In spite of our boasted common school system of education, the schools of England, France, Holland, Sweden, Switzerland, Denmark, Germany and Wurtenburg are far ahead of us in teaching the child, as Aristotle said, "that which he can practice when he comes to be a man."

Many farmers object to the introduction of these studies into our common schools on the ground that no school can teach a child the art, or in other words, the practice of farming. This is true. But it is not contemplated that the art of farming should be taught. Our common schools do not teach the art of arithmetic as applied to the conduct of all the vast business that is carried on about us. But business cannot be carried on without arithmetic, and so we teach the child the foundation principles of the *science* of arithmetic and when he comes to a business life he easily learns to put those principles into practice.

So with all other studies; it is not the practice, but the underlying science which is taught, and we send the boy or girl to school with the firm trust that they will learn all the more the better practice because of having been taught in their youth the principles which underlie that practice. For instance, very much of our farm literature, experiment station bulletins, and the books that are written, shedding important light on one or another of the special branches of farming, are obliged to use terms which belong to the science of their subject. Many good farmers find themselves barred at once from a full comprehension of those terms, and also of the subject, because they had never made a study of the principles or things those terms describe.

Would it not have been a great advantage to those farmers if, when they were boys in the country school, they had been taught on such matters?

Why should not the farmer's boy be taught the meaning and action of the elements of fertility; of animal economy; of the chemistry of feeding; of the principles which govern the growth of plants; and the physiological adaptation of different farm animals to their true purpose?

There is a great mass of useful knowledge relating to the *science* of agriculture which should be taught to our boys and girls. Such teaching would prove a thousand times more useful and helpful to them in after life, than much of the knowledge that is now taught. The people of Europe see this, and are giving their children this education.

Is not the American farm boy and girl as worthy of this great advantage as those of any other country?

INQUIRIES AND ANSWERS.

Every inquiry must be signed with the name, Post-office and state of writer. Condense the questions into plain specific inquiry. Be careful to note if your questions have not been answered in replies to others. We are glad to answer all the pertinent questions that we can concerning machinery. Look over our advertising columns and write to the advertisers.

FEEDING STANDARDS FOR MILCH COWS.

Dry matter.	DIGESTIBLE NUTRIENTS		
	Protein.	Carbohydrates.	Ether extract.
lbs.	lbs.	lbs.	lbs.
23 to 28	2.0 to 2.5	12 to 15.0	0.5 to 0.8

COLORADO QUERIES.

I have about thirty tons of clover and timothy that two days after being put up in large shocks, received two heavy rains, one each day successively, and was pretty thoroughly wet. It was re-shocked and allowed to dry before being stacked,—but the clover is black, and the timothy very much colored. Will you tell me what per cent this hay has lost of its feeding value for milk cows and for young cattle?

Do two-year-old heifers in milk require more feed in proportion to weight than grown cows?

I am milking four, feeding ten pounds grain, as per your feeding formula, and what clover and timothy they will eat, but they give very little milk,—ten pounds, fifteen pounds, ten pounds and twenty pounds, respectively. Two are grade Jerseys (the smaller milkers), and two are full-blood Holsteins, and have been milking four months.

Petersburg, Colorado. T. G. Y.

The amount of damage sustained by the hay getting so thoroughly wet can hardly be computed. It could quite easily reach fifty per cent, and might be more.

All growing animals require more feed—per thousand pounds weight—than those that are mature. The yields reported are not particularly bad for two-year-old heifers, although many do much better. With anything like fair hay, ten pounds of grain ought to suffice; but when the hay is less valuable than straw there is a presumption that more grain would not be amiss. Try increasing the feed a little and gradually, and notice the effect.

A NEW JERSEY DROUTH.

The state of New Jersey suffered severely from early spring and summer drouth, and is consequently very short of hay. Will you please tell me whether I can carry our cows through this winter and keep up full flow of milk on fresh, sweet corn stover and wheat straw for roughage, by making up protein from dry brewers grains, wheat middlings and corn meal? We sell milk. An early answer will greatly oblige A. T. E.

Ashland, N. J.

We cannot quite guarantee as good results from corn stover and wheat straw for roughage as might be expected from silage and clover hay, but cows ought to do fairly well on a daily allowance, substantially like the following:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
15 lbs. corn stover	8.93	.26	4.86	.11
8 lbs. wheat straw	7.23	.03	2.90	.03
10 lbs. dried grains	9.18	1.57	3.63	.51
2 lbs. middlings	1.76	.26	1.06	.07
2 lbs. ground corn	1.78	.16	1.33	.09
Totals	28.88	2.28	13.78	.81

It is hardly to be expected that *all* the stover and straw will be eaten, and this will tend to reduce the amount of dry matter, much more than the digestible nutrients. It would probably improve the ration very considerable, and not add to its cost materially, to substitute two pounds of linseed oil meal for four pounds of the dried grains.

The stover could also be made much more palatable, and considerable waste avoided, by running through a cutting box, dampening and letting lie in a pile for twenty-four hours or longer, to soften and heat up somewhat.

A PENNSYLANIA RATION.

Will you kindly formulate a ration for me under the following conditions: Cows, Jersey and grade; average weight, 1,000 pounds. Oats, thirty-five cents per bushel; corn, forty-five cents per bushel; wheat bran, $16 per ton; mixed hay, $14 per ton; ensilage from fairly well eared corn. Average price of milk, 6⅔ cents per quart. Can get oil meal but is dear. F. S.

Ridgeway, Pa.

As oats are worth not to exceed ten per cent more than bran, the price at which they are quoted forbids their consideration in making up a ration formula. Hay is also quoted much above its relative feeding value and should therefore be used as sparingly as possible. Leaving out of consideration its greater residual manurial value, the actual feeding value of bran per ton is fully twenty per cent more than that of the best mixed hay, and the difference between hay and corn is much greater. If limited to the feeds named we would suggest a trial of the following:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
30 lbs. silage	7.92	.39	4.20	.21
5 lbs. hay	4.29	.24	1.98	.08
10 lbs. bran	8.81	1.26	3.86	.30
4 lbs. corn	3.56	.32	2.66	.17
Totals	24 58	2.21	12.70	.76

Mix grain with silage, feeding half at night and half in the morning. If the cows are accustomed to a midday foddering give them the hay then. Otherwise feed the hay at night. Do not omit the daily allowance of salt, or better yet, a small tablespoonful both night and morning, with the feeds.

WHAT TO DO WITH THE CORN.

I have six acres of corn which I would like to save, but don't know how. It stands eight feet high, and the silk on that most matured is just beginning to turn a little brown. I don't suppose it is matured sufficiently to make good ensilage, even if I had a silo, and such green stuff probably could not be made into "corn hay," and we are liable to have frosts most any time now. A. H. K.

Coupeville, Wash.

This inquiry was dated October 2nd, and was appended as a postscript to a letter making a remittance for Prof. Henry's book on "Feeds and Feeding." It consequently had to go through the book keeper's hands, and from him to the mailing clerk, before reaching the editor's table. The result is, that the answer to the inquiry has been unavoidably delayed until the present time, too late, we fear, even if a satisfactory answer could be given, to be of any benefit for the present year.

When a business has grown to the proportions which obtain in the offices of HOARD'S DAIRYMAN, there is, necessarily, more or less of routine required, and to take anything out of its regular channel, almost certainly leads to confusion. It would be a great convenience to us, and insure more prompt attention, if correspondence intended for the editors should be kept distinct and separate from that which relates to other matters. Of course, we are glad to hear from our friends in any way, but we have frequent occasion to regret that some matters are unavoidably delayed until the answer loses much of its pertinency.

The only thing to have done with this immature corn, was to cut it off near the ground and set it up in smallish "stooks" or "shocks" or "stouts," and let it cure in that way.

THE BAR IN MODEL COW STALL.

A California reader inquires about the cross-bar in the Model cow stall. This bar should be about two inches square and firmly spiked to the floor. If a 2×4 is used, it should be laid flat wise.

RATION FOR FATTENING A COW.

E. C. A., Los Angeles, Cal., has a grade cow, nine years old, weighing 1,000 pounds and giving two to two and one-half gallons milk per day, that he wishes to fatten. Barley hay is worth $13 per ton; barley straw, $5; alfalfa hay, $10; bran, $22; rolled barley $21; shelled corn, $21. We may say, in reply, that unless old cow beef brings more money in California than in Wisconsin, it will not pay to try to feed this cow very long. As long as the milk holds out, give her generous feed—all the barley and corn, mixed with some bran, that she will eat, taking care to increase the daily allowance so moderately as not to drive her off her feed.

SHREDDING CORN STOVER.

I have been a student of your paper for some time, and have been greatly aided by it. Please tell me, will it pay to have fodder corn run through a threshing machine? I have three acres of very heavy and well cured fodder, and would you advise me to soak the threshed fodder before feeding? Can a good ration be had from threshed fodder corn, ground corn, 25 cents per bushel;

ground oats, 22 cents per bushel; and timothy hay, $6 per ton, all of which I have. Or would you advise me to buy some bran at $16 per ton? Is buck wheat any good to feed cows? I intend to have a silo next year. T. W. H.

Wyalusing, Wis.

It doubtless makes corn fodder (stover?) much more palatable to run it through a shredder, and in the absence of a regular machine for that purpose, a common threshing machine may be used. However, unless the fodder is pretty dry, care must be taken not to store the shredded material in large stacks or big mows, as it would be likely to mould. Shredder fodder is not improved by wetting.

A satisfactory ration cannot be had from the feeds named, for the reason that in any practicable amounts they would not furnish sufficient protein. One should have some gluten feed, cotton seed meal or other feed rich in protein to combine with them. Bran answers a very good purpose, but is outrageously dear at $16 per ton. Oats are decidedly cheaper.

With ten pounds stover, ten pounds of hay, five pounds of oats and five pounds gluten feed, one could expect cows to do fairly well.

Buckwheat middlings make a splendid addition to the feed for a dairy cow. Grind the full grain, separate the flour and sell that and then have a most valuable by-product remaining.

RATION FOR YOUNG SWINE.

Please give me a ration on best way to feed pigs, to commence at six or eight weeks old, and have them fit to kill at from seven to nine months. Grain on hand is corn, oats, buckwheat, barley and peas; also plenty of sour milk. R. H. K.

Whippleville, N. Y.

For most economical gain feed four pounds milk to one pound ground corn. It is impossible to specify with even approximate certainty the amount that will be eaten daily. The best guide is to watch the trough and require everything to be cleaned up.

In Prof. Henry's book, "Feeds and Feeding," on page 551, is a table relating to this subject, from which we extract the following figures:

Weight of pigs in pounds.	*Actual av. weight.*	*Av. feed eaten per day.*	*Total feed for 100 lbs. gain.*
	lbs.	lbs.	lbs.
15 to 50	38	2.23	293
50 to 100	78	3.35	400
100 to 150	128	4.79	437
150 to 200	174	5.91	482
200 to 250	226	6.57	498
250 to 300	271	7.40	511

In this table six pounds of skim milk are calculated as equal to one pound of grain. If cheaper, some barley could be used in connection with the corn. Barley makes the finest kind of pork.

Note a'so how much less feed is required for one hundred pounds of gain when the weight is below one hundred pounds.

KEEPING SKIM MILK SWEET.—WOOD ASHES AS AN ABSORBENT.

The creamery to which my milk goes receives only once each day—in the morning—and the first to arrive, unless willing to wait a long time, have to take milk separated the day before which, always very sour, is also little better than whey, frequently.

Now is it not both possible and practicable for a creamery while operating separators with steam to connect pipes with the separated milk vat and heat (pasteurize) it to such a degree as to preserve sweet until the following day?

In your opinion, would wood ashes make a good stable absorbent? "SUBSCRIBER."

Potsdam, N. Y.

The DAIRYMAN has preached, in season and out of season, the necessity of sweet skim milk for animal feeding and has called attention time and again to the losses that come to the farmer, both in milk and animals, from the sour, dirty skim milk tank.

The patrons of a creamery should not allow the valuable skim milk to go to waste as they do. The average creamery proprietor does not consider that it is his duty to look after the skim milk that belongs to another man. The creamery patron considers it the other man's duty, and the result is that the milk is wasted.

It is both practical and possible for the skim milk to be kept sweet at the cost of a little work and trouble and a small cost for the necessary apparatus.

The easiest way is to have two skim milk tanks, tin lined, and have one of them cleaned out every day. This will give sweet skim milk, except in the very hottest weather. A better way is to have the milk pasteurized by means of the waste steam, but if this last method is used, care must be taken either to cool the milk that is to be left in the tank over night or to jacket the tank so that the temperature will not fall below 120° F. otherwise the milk will rapidly cool to abont 100° F. and sour with great rapidity. Whereas, if it is cooled to 60° F. or kept hot it will remain sweet.

Wood ashes are not a good absorbent for the stable. Besides being caustic when they are wet they are apt to cause loss of nitrogen by driving off the ammonia. Bedding, dry peat or a mixture of road dirt and land plaster are better.

AN IOWA CASE.

Will you kindly give me a ration from the following feeds? I feed for butter. Cows are Jerseys; weigh about 700 to 850 pounds:

Ground corn, $10.50 per ton; bran, $10.00 per ton; ground oats, $13.50 per ton; bright oat straw, bright corn fodder cut in length about two inches. (Don't know cost or value.) Are raised on the farm.

Has sorghum cane, sowed in June and cut in October, much feeding value? If so, what as compared with corn fodder? F. S.

Polk, Iowa.

It is simply impossible to make a satisfactory ration from the feeds named. The nearest approach to it would be 10 pounds oat straw, 10 pounds corn stover and 15 pounds bran; and these small cows could not take care of so much. With such roughage, one needs some oil meal—not less than a pound daily for each cow—and some gluten feed, say 4 pounds, and about 5 pounds bran. If the cows are worth keeping at all—and being Jerseys the presumptions are all in their favor—it will pay to feed them as dairy cows ought to be fed.

If the sorghum hay did not get frosted, it will make very good feed, probably considerably better than ordinary corn stover.

JUDGING CALVES.—THE DAIRYMAN HELPS TO SECURE FIRST PREMIUM ON BUTTER.

I enclose, herewith, one dollar to pay for paper for the coming year.

I was glad to receive cards to distribute, and hope some of the recipients have returned them. I think I can distribute a few more to your advantage.

I look for the DAIRYMAN weekly, as it is a great help to me.

Last spring I wrote you in regard to some trouble with cream and last week I took first premium on butter at three combined county fairs.

I would like to ask about raising calves. Cows are mostly ordinary stock. Bull is a good registered Guernsey. I want to raise best heifers. What are the good points you look for, and what defects in a calf will cause you to kill her?

You say a bull should have well placed rudimentary teats; how far apart do you want them? G. D. S.

Holyoke, Mass.

The DAIRYMAN is gratified that this friend and many others have so good an opinion of it, as to be willing to aid in its increased circulation. The extra cards have been sent. It is also pleased to learn that its advice in the case referred to proved so satistactory. This is by no means an isolated instance, but it happens to be in a line not so frequently mentioned, and attests to the wide and diversified merit of the paper.

We would judge a calf by much the same "points" that we apply to the mature animal, making allowance of course for the changes incident to growth. There are those who insist that the mouth of the calf is an index of its future constitution, and refuse to raise those not having a full and well developed set of teeth. We would not go quite to this length with a calf whose breeding promised special excellence, but would rely upon extra care to overcome the pre-natal defects. We like to see the arching flank, the the thin incurving thigh, and well placed teats, even in the young calf.

The rudimentary teats in the bull should be three to four inches apart, and a half inch or more long.

STATE VETERINARIAN'S SERVICES.

A Wisconsin reader asks how the State Veterinarian may be had to examine cattle in his neighborhood, that give indications of tuberculosis, and what expense, if any, attends such official inspections. As we are unable to give full particulars, we advise writing to that officer direct, Dr. H. P. Clute, Marinette, Wis.

MILK FORMING TOO EARLY.

I have a registered cow that will calve in December, 3-year-old and has one teat that gives just a little milk out of it. She is a very rich milker. The teat never had any thing the matter with it J.

San Antonio, Texas.

This is not a very uncommon occurrence. Unless the udder enlarges quite considerably do nothing, but if it becomes too much swollen and tender withdraw the milk.

WHAT IS A 14-POUND COW WORTH?

I am surprised that any one would send my name to you as one interested in the dairy business. I bought a cow a short time ago because the party represented that she would make fourteen pounds of butter a week. I tested her today and am satisfied with the result. What is such a cow worth when seven years old, and has never been dry since her first calf? My wife thinks that we could get the twenty-five cents worth from the paper, so I enclose you that amount on a trial subscription. H. M.

Leavenworth, Ind.

We think you have a bargain in the cow, regardless of the probable price paid and that you have a wife of excellent judgment, whose advice is worth following in many particulars.

The value of a cow that will make fourteen pounds of butter a week compared with that of one which will make only seven pounds a week, can be estimated in a way from the following figures:

Suppose the food cost of simple maintenance in either case is eight cents per day, and that it requires in addition eight cents worth of feed to make a pound of butter. The seven-pound cow would consume $1.12 worth of feed in a week and the fourteen-pound cow $1.68 worth. At twenty-two cents per pound for butter the respective incomes would be $1.54 and $3.08 and the net profits forty-two cents and $1.40 respectively, or practically $1.00 per week in favor of the fourteen-pound cow. This difference would not continue throughout the season, but is quite safe to estimate it at $30 for the year. A cow seven years old is good for at least five years more of service, and on the foregoing basis, if the seven-pound cow is worth $50 the fourteen-pound cow is worth $165. In order to refund the purchase price and six per cent annual interest thereon, the first cow must return an annual net profit of $13 and the second cow an annual net profit of $42.90.

A WELL STATED OHIO FEEDING PROBLEM.

Would you please make me a balanced ration out of some of the following feeds: Wheat bran, $15 per ton; corn bran, $13 per ton; oil meal, $24 per ton; Quarker Oat Feed, $15 per ton; sugar feed, $14.20 per ton; corn and cob meal, $12 per ton; ground oats, $18 per ton.

I have plenty of corn stover and clover hay for roughage, but my hay is not first-class. The balance of my feed, with the exception of corn and cob meal, I have to buy. Sugar feed is a very popular feed with dairymen here. It is a by-product of a glucose factory. So I want as cheap a ration as is consistent with good results.

Which is the best way to feed, wet or dry? Dairymen here, claim that they get the best results by feeding wet feed. Would it not be best to run the stover and hay through a feed cutter, and mix with ground feed and then scald thoroughly? Would it pay me to buy malt from the brewery at eight cents per bushel? I would have to take the same amount every day in a year.

I have been a subscriber of your paper for several years, and find it full of practical dairy knowledge. W. C. W.

Dayton, Ohio.

We have discussed the wetting of feed in reply to an inquiry from Leadville, Colorado. With plenty of water, not too cold, and convenient of access, and opportunity for each cow to drink without fear of molestation, we have never observed any benefit to result from wetting the feed—except as it may be desirable in case of mixing the grain with dry chaffed fodder, in order to prevent its sifting through.

Wet brewers grains are an excellent feed when strictly fresh, provided they are stored and fed in water tight compartments, but if the water is permitted to drain from them through the floors, they are liable to make breeding places for undesirable bacteria. Their feeding value per ton is somewhat less than one-third that of bran. Sugar feed is the same as gluten feed, and if of good quality deserves its popularity. It is much the cheapest of the several grain feeds named.

We, therefore, recommend as follows:

FORMULA FOR RATION.	*Dry Matter.*	*Digestible Nutrients*		
		Protein.	Carbohydrates	Ether Extract
15 lbs. clover hay....	10.16	.82	4.30	.20
10 lbs. corn stover....	5 95	.17	3.24	.07
5 lbs. corn and cob meal.....	4.45	.32	3.15	.18
5 lbs. sugar feed.....	4.61	1.02	2.42	.20
Totals.....	25.17	2.33	13.11	.65

We have estimated the clover hay as damaged 20%. We always advise chaffing (cutting) a part of the roughage where this is practicable, and in the case of corn stover, dampening it sufficiently to cause it to heat and soften somewhat. In such cases use about equal parts by weight of the cut fodder and grain. Feed some of the forage without cutting.

COST OF KEEPING STOCK OF DIFFERENT AGES.

Enclosed please find $2 for Prof. W. A. Henry's Book, "Feeds & Feeding." I want to know, along with a great many other things, how much does it cost a week to keep a yearling, a two-year-old, and a dry cow in good growing condition in winter quarters. I presume I will find out all about it in the book. R. M. B.

West Springfield, Mass.

The book has been sent as ordered, but we have some fear about Mr. B.'s finding the specific information he seeks, but he will find a full discussion of the various conditions which enter into the problem, and by applying the information thus obtained, learn to select feed stuffs with discrimination, being guided by their relative feeding and market values.

The tables reproduced in full on page 636-7 in Prof. Henry's book, make the following estimate of digestible nutrients required per day and per one thousand pounds live weight to maintain weight in case of mature animals and provide for growth with those that have not reached maturity:

	Protein lbs.	*Carbohydrates lbs.*	*Fat lbs.*
Mature Animals...	0.7	8.0	0.1
Cattle 12 to 18 mos.	2.0	13.0	0.5
Cattle 18 to 24 mos.	1.6	12.0	0.4

If a yearling weighed 500 lbs. it would (theoretically) require one-half of the amounts specified above, or 1 lb. digestible protein, 6½ lbs. digestible carbohydrates and 2½ lbs. fat (ether extract). This is a trifle more than is found in 10 lbs. of good clover hay or in 8 lbs. timothy and 2 lbs. bran.

The Winter Calf.

ED. HOARD'S DAIRYMAN:—It is getting to be very commonly the practice among dairymen and farmers to have a portion of their cows come fresh in the fall. The care of the young calves at this time and during the succeeding months is a point of considerable importance; since upon it depends, to a great extent, the future usefulness of the animal.

In the first place the dairyman should depend upon the female increase to keep up his herd; consequently he must use all precaution and spare no effort to make the very best possible cows of the young things. It is taken for granted that he is using a thoroughbred sire, and in this way striving, with the aid of judicious selection, to raise the average yield per cow from year to year.

In raising calves, as in most other things, much depends upon getting the right start, and a calf of superior excellence may be made an inferior cow, solely by wrong treatment during the first few months of its life.

To begin at the beginning, the calf should be removed from its mother as soon as possible after its birth. In this way there is less grieving at the separation on the part of the cow, and also the young thing more readily takes to its food, in other than the natural way.

A well littered, roomy stall is the best place for the calf, which should always be by itself, not allowing two to occupy the same stall. Teach it to drink by placing the milk, fresh from its mother's udder, in a shallow vessel, and with the tips of the fingers on its nose. By gentle pressure it will not be difficult to direct its attention to the warm milk. Usually it is not necessary to allow the calf to suck the fingers at all, although there is great difference in animals in this respect. Some are quick to learn, others dull and stupid.

However, no one ever gained anything by losing patience with a calf when teaching it to drink. The utmost kindness should ever prevail; any other is brutal in the extreme, considering the extreme helplessness of the animal.

Only new milk should be given for the first week or ten days, then gradually add sweet skimmed milk to this, until at the end of two weeks, only skim milk is given. This should be always blood warm, never too warm nor too cold. Too hot or scalded milk invites constipation, while that which is too cold is apt to cause diarrhœa.

The quantity must be gauged according to the size and age of the calf. The particular breed may have nothing to do with this question of how much to feed, but I have found that a Jersey or Guernsey does not require (nor is it advisable to give) so much milk as a Durham. Feed three times a day, two or three quarts at a time, increasing the amount as the calf grows.

Watch carefully for indications of diarrhœa, which is sometimes brought on by over feeding of milk. Keep bright clover hay in a manger before it after the animal is two weeks old. It is surprising how soon they will begin to nibble at it. This should be turned over every day, or thrown out to other stock and fresh put in its place.

The question of grain for calves is one upon which all do not agree. It has been our practice for a number of years to begin feeding dry bran early, and we believe it pays so to do. Ground oats is an excellent food for all young animals, and where it is more convenient this may be fed instead of the bran. Either should be fed dry and not put into the milk. The action of the saliva upon the grain is essential and this is missing when it is taken with the milk. I knew of one man who fed whole oats in the milk. It ought not to require a very great degree of intelligence to decide that this is a bad practice since the grain would be swallowed whole, not masticated at all. Salt should be supplied to calves. They crave this. In cases where the boards of the stall are gnawed and licked by the animal it is traceable to the want of salt. I have seen boards eaten entirely through in this way. One feature of the care of the winter calf very frequently neglected is cleanliness of its quarters. A good dry bed is essential to thrift, and a calf cannot thrive in a vile, filthy place. Especial care is required while it is quite young and the droppings soft and watery. The pen should be cleaned out and well littered at least every other day, oftener if necessary, and the air kept pure and sweet. With abundance of straw at hand it is nothing unusual to find calves, pigs, etc., wallowing in filthy pens while ten minutes work would make everything neat and clean.

This same straw stack may be drawn upon to make the place warm. If not already comfortable pack with straw around the sides. This inexpensive material shuts out cold exceedingly well, and may well be employed in many instances. At any cost do not allow your animals to go cold and shivering. Under such circumstances they cannot grow as they otherwise would.

A calf dropped in autumn or winter, in nine cases out of ten, is in far better condition at the end of six months than one born in spring or summer.

The object in view is to keep them growing steadily. As they grow, increase the feed, giving clover hay or corn fodder, (well cured) all they will eat. I have had six months' old calves eat cut corn fodder greedily. They need plenty of roughage, and it is not considered best to allow the future dairy animal to become very fat. Indeed, this is detrimental to best results. Rather a good, muscular development than fat.

For this reason, skim milk is better than whole milk. It is not an animal fit for the butcher's block that we want, but one with paunch well developed. I have long since ceased to be ashamed of a "pot-bellied" Jersey heifer calf.

Now, just a word concerning dainty and delicate animals. There are sometimes such calves born. Every dairyman knows the difference between the hungry calf and the one that never cares whether it eats or not. My experience with these has been such that I believe it rarely pays to bother with them. Better kill them at once than try to keep them. The chances are it will be time thrown away to fuss with them. If they live they will not amount to very much, since a dainty calf is quite likely to be a dainty cow, and we only want those that have the appetite of a goat or a school boy.

It is sometimes a question to know what to do with the male calves. If of the dairy breeds, no one wants them for beef, at least, the butchers are not hankering for such animals. If they are fed grain in connection with skim milk until two, three, or four months old, they make very nice eating for the farmers' family. They will be found fat enough; and while not like veal, exactly, the meat is very sweet and tender. We call it baby beef, and never have the least trouble in disposing of them in a big family like that usually found in the farm home.

Michigan. W. C. ROCKWOOD.

Why Do We Keep Cows?

ED. HOARD'S DAIRYMAN:—In this portion of New York the farmers might well pause and ask themselves this question. Nearly all are producing milk for the New York city market at the present time for only one and two-fifths cents per quart, and this too in a year of unparelleled drouth when cows have had to be fed ten months out of twelve if kept at even a moderate flow of milk.

A general impression seems to prevail that nothing else can be done except to continue to suppy the city dealers with milk and take whatever they chose to give, although many have been raising calves which will result in a loss fully as serious as the selling of milk, because the selling price when marketed will not equal the cost, as the breeding and feeding are such that will produce inferior animals.

One dairy here is composed of mostly high grade Holsteins, and some of them with proper care and feeding would give from twenty to thirty quarts per day, but under the present system of feeding, give only from eight to twelve. They must be cut off in feed supply because not enough has been raised to carry them through the winter. Better dispose of part of them at a great sacrifice, and feed the remainder for a profit, than to keep them all only on a maintenance ration.

Some of these are lately fresh and others soon will be, but the same mistake of last year will be repeated in allowing them to shrink less than one-half of their capacity by withholding feed.

Corn for silage is usually planted here, thick, in rows three feet apart, and usually a large crop of fodder is produced on an acre, but being so thick not enough of sunshine is stored in the plant to make a very desirable feed, it being immature and "washy" even if the kernels are glazed. I picked up a piece of an ear last winter and when dried the juice of the kernel all evaporated and left nothing but chaff.

Corn is a semi-tropical plant and needs warmth and sunshine, but the farmers here are slow to learn, although farmers' institutes are held in nearly every community. I planted twenty-five acres of "Pride of the North" for silage, putting the rows three feet and eight inches apart and planting much thinner in the row. The result is, I had not so great a quantity of fodder per acre as though it had been thicker, but I had corn that would yield about thirty-five bushels shelled corn per acre and matured sufficiently to make a cow feel as though she had more than husks to feed on, and if such feed could be supplemented with some nitrogenous food their owners' pocket book would be filled to repletion, but the contrast between the Wisconsin and Iowa dairymen and the general eastern dairyman is exceedingly great, so much, so that one would not think they were working for the same result. F. C. J.

Conklin, N. Y.

Hot Water at the Barn.

ED. HOARD'S DAIRYMAN:—That is a heading probably never before seen in a dairy or agricultural paper. That is the next improvement to come, and for myself I have concluded to have it the coming winter and heat the water with a tank heater, now in general use.

Those cylindrical tank heaters were sold to the farmers for sixteen dollars each, when the cost of manufacture was less than five dollars. The inventor got eleven dollars for his patent and was contented to put the money in his pocket without perfecting the invention. I have used one of these heaters ten years, and for the last five, have been trying to find some way to warm milk and other feed for calves and hogs to 100° F. Drinking water for the cows is usually kept at about 60° F. We have had trouble enough carrying milk into the house to warm. When a man returns for it in a half an hour, he will find it cold or nearly boiling hot. Now I will warm it at the barn and know it will be just warm enough whether it stays there half an hour or an hour.

In five minutes, I can raise the temperature of drinking water from 32° to 60°.

I shall pump into my stable with the same pump either hot or cold water or a mixture of the two. This hot water I want in the stable for wetting bran. I consider bran worth twice as much wet as dry—in other words, a man will get as much for his money if he feeds wet bran that cost him twelve dollars per ton as to feed dry bran at six dollars per ton. Every farmer and every farmer's wife will be glad to see the old system of warming milk over the kitchen stove abolished, whatever may be the general opinion about feeding wet bran.

With eight quarts of wet bran once a day and four quarts of whole oats once, there will be no clogging in the manifolds, but both will have a tendency to move through the stomach easily and keep the bowels loose—a very important thing for a dairy cow. A spoonful of salt should be mixed with the bran.

The cost of making the change so to warm the milk by the tank heater, may be from $2 to $3, with scarcely any additional cost for fuel.

The inventor of our tank heaters did not have them to clean, or he would have left them in better shape for cleaning. We have burned coal and cleaned out the ashes once a week, and then had the trouble of starting a new fire by using wood. The fire is raised a little higher each day by the accumulation of cinders and ashes, until the fire is so high the last day, that the water is warmed but little.

Now there will be a change and the heater will be cleaned every other day in less than two minutes, without putting out the fire. This will avoid a very dirty disagreeable job, which we have had every week all winter. The cost of making the change in the heater will be about $1.50.

With warm water, warm bran, warm ensilage and warm stables, we can get very near summer conditions, with flies and intense heat left out. With ice water, frozen ensilage, cold barns at night, and an open yard for the day, we get to the other extreme where cows must be unprofitable. My neighbors fed frozen ensilage during the severe weather of last February, while I am perhaps the only man in the northern states feeding ensilage at 90° at the same time.

Oconomowoc, Wis. N. B. WHITE.

"You Never Miss the Water Till the Well Runs Dry."

So it is with health; we never realize its value until it is gone. When old time strength and vigor are wanting it is the best to look at once to the blood. Purify it by taking Hood's Sarsaparilla, and restored appetite, perfect digestion, steady nerves and even temper will prove that it is bringing back the glow of perfect health.

Hood's Sarsaparilla
Never Disappoints

Hood's Pills cure liver ills; the non-irritating and only cathartic to take with Hood's Sarsaparilla.

The Feeding Problem in New York.

ED. HOARD'S DAIRYMAN:—The hay crop in this section, owing to the drouth, was very light. Many farmers around here will be short of dry fodder. In our case we have thirty-three head of cattle, sixteen calves and three horses which we would like to get through the winter in good shape. About twenty-five of the cows will be giving milk; however, of that number only five or six will be fresh before February. About fifteen of them will be milked right through the winter.

We have about forty tons of timothy hay, 100 tons corn silage, 200 bushels of oats, forty bushels wheat, about five tons of bran and about what straw we need for bedding. Bran is worth $17 per ton. Middlings, and gluten feed each about $19 per ton, corn meal about $18. Cotton-seed meal isn't used or sold here and I haven't looked up the price in car lots. Milk is now netting us in the factory about $1.13 per cwt. We want to get as much milk as we can from our cows both on account of the price and the added fact that many of them are heifers. Hay is worth about $10 in the stack or $12 delivered. Straw is worth $5 and $6.

One other fact: We have owned this farm only about eight months. It has been used as a "hay farm" for the past five or six years. The liquid manure has never been saved. We desire to increase the productiveness of the soil very largely.

Now the question is, what would you advise us to do? What feed or feeds would you advise us to buy and in approximately what quantities? And will you give us a balanced ration? We take our milk to the

Eureka Harness Oil is the best preservative of new leather and the best renovator of old leather. It oils, softens, blackens and protects. Use

Eureka Harness Oil

on your best harness, your old harness, and your carriage top, and they will not only look better but wear longer. Sold everywhere in cans—all sizes from half pints to five gallons. Made by STANDARD OIL CO.

Finer Flavor, better quality, better price; that's what results from the use of the Champion Milk Cooler–Aerator in your dairy.

Our book about it free.

CHAMPION MILK COOLER COMPANY,
67 Main St., Cortland, N. Y.

factory till about the middle of November, then we go to a creamery through the winter. We have seven cows that will average in weight about 1050 pounds. Our heifers are grade Ayrshires and will average about 900 pounds. Our calves are registered Ayrshires.

The cattle will be given close and careful attention throughout the winter. They will be well housed and our water supply will be so arranged that we can water either indoors or outdoors as the weather may warrant. The chill will be taken out of the water before being given to the stock. I think I have given you the main points and if you will accomodate me with an answer I shall deem it a very great favor. G. E. P.

St. Lawrence Co, N. Y.

Without attempting to be exact, we estimate that G. E. P. will feed as an average about twenty cows in milk and that the calves and remaining cows will be equivalent to about twenty dry cows. The feeding period will be about 200 days. We would reserve the oats for the horses and exchange the wheat for good straw and feed that to horses. Cotton seed meal can probably be bought delivered for about $23, and at that price it will pay to feed it as liberally as consistent, both for its nutritive effect and the residual fertilizing elements. Take the litter and manure from the horse stable and spread in the gutters behind the cows to absorb the liquids. Also buy a few barrels of land plaster and use from a pint to a quart in the stable for each animal every day. This will fix the ammonia in the manure and thus conserve its value as well as add to the healthfulness of the stable.

We cannot give a formula adapted for cows in all the different stages of lactation but the following will serve fairly well for cows in full flow of milk, and as they commence to shrink decrease the amount proportionately:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
25 lbs. silage	6.60	.33	3.50	.18
10 lbs. hay	8.68	.28	4.34	.14
5 lbs. bran	4.41	.63	1.93	.15
3 lbs. ground corn	2.67	.24	2.00	.13
2 lbs. C. S. meal	1.84	.74	.34	.18
Totals	24.20	2.22	12.11	.78

This will take half the hay and half the silage, and the remainder will very nearly take the dry cows and calves through the winter, Perhaps they will need a little grain, but not very much.

New York Farm and Dairy Notes.

ED. HOARD'S DAIRYMAN:—We have three creameries in our town. Until two years ago there were only two, one milk shipping creamery, and one which makes cheese. Some of the patrons became dissatisfied with the prices paid, and were induced by some Elgin creamery builders to form a stock company that would buy the creamery they wished to build, and run it on the co-operative plan. Stock was issued and sold to the amount of $6,000. This was probably between one and two thousand dollars more than the creamery cost, but the stock owners preferred to pay the Elgin builders this large profit, than to build the creamery themselves, and save it. This creamery is making Elgin creamery butter, the milk shipping creamery mentioned is supplying a milk route in New York City with bottled milk and cream, and the other creamery makes mostly cheese. The two latter are owned by individuals who buy the milk and pay one-half a cent less than the New York price.

The average price for the year is not over two cents per quart. The question which our people are trying to answer, is, whether a co-operative creamery can make butter and sell it at a price that will pay its owners better than selling milk for the prices paid at the other creameries. The patrons of the co-operative creamery receive back their skim milk, and counting the value of this, I think there is but little difference in what has been realized by the patrons of the three creameries for their milk.

PROFIT IN A SMALL DAIRY.

I know a man who has a position where he earns good wages all the year. A few years ago he bought a small farm near the village where he works. This farm he is paying for with his savings. A few good cows are kept, which are mostly cared for by the wife and children. Very fine butter is made, which is put up in prints. They have established a trade for this butter in the village, and are not able to supply the demand for it, at a price considerably above the general market. The skim milk is fed to hens, which add something to the income of the farm. But little work is done on the farm, except to cut the hay, and care for the cows. The family are all working together to pay for the farm, and all have something to do, and are encouraged in their work by the prospect of owning their little farm home, where they can live very comfortably and save some money, with the income of the little dairy to add to the wages earned by the man.

Probably there are other wage earners, who having a salary they can depend upon, would be encouraged to save money to buy and pay for a home, if similarly situated. If the right kind of a man goes in debt for such property, it may be the best thing he can do, for if he was not in debt, he would have less inducement to save money. If a poor man has a wife and children who are willing to work and help him, a little farm like the one mentioned gives them the opportunity, and children living in or near a village are much better off for having work of this kind to do. Instead of spending their time on the street, and getting the education of the street, they can be made to become interested in the farm, and learn many things of use to them.

SOME COMPENSATION IN FARM LIFE.

The most of the farmers I meet are dissatisfied. They complain that they can only just make a living and work hard and practice close economy. These people do not seem to realize that the poor man, who works for other people for wages, or the man with the small capital, who is engaged in trade, are engaged in a harder struggle for a living than most farmers. I know people, who had some money invested in farms, because they could only just make a living, became discouraged, and finally gave up their farms. Some of them moved to the village, rented houses, are now trying to support their families by working by day's works, wherever they can get work to do.

I think if I was on a farm and had some money invested in it, that I would make a strong effort to pay for the farm, which would make a home for me. There are some compensations in farm life, which are not always sufficiently appreciated by the farmer. He works for himself, and can plan the work as he chooses. He can work hard when he wishes, or rest when he needs to, instead of working under a boss, as the most of the wage earners do.

The man, who works for others, may at any time lose his job, and his wages stop until he can find another, and soliciting work is not very pleasant for many people. The fruit and vegetables he can grow, will make a large part of his living, and these need to cost him but little. He can plant trees and vines to embelish the grounds about his residence, which need to cost him but little, besides his own labor. As the years go by, he can add improvements as he can afford, and these he will appreciate more because of the personal effort he makes to get them.

We value things according to their cost to us. If a man builds up and improves a farm by his own labor, he appreciates what he has acquired far more than if some one else had done the work, and he had bought the farm with all the improvements on it. When a man plans improvements on a farm according to his own ideas, and then works out his plans, a part of the individuality of the man goes into the farm, and the farm reveals, to a large extent, the character of the man. A man engaged in this work, not only may improve and build up a farm, but the efforts he makes develops a stronger and better character in the man. With the great majority of people, the conditions of life are not easy, and with increasing competition, the struggle is growing more intense, and on this earth, I believe there is no better place for a man, whose tastes and abilities adapt him to the work, than on the farm. W. J.

DAIRY MARKETS.

The present phenomenal rise in the prices of cheese, especially in the New York markets, is a clear illustration of the corresponding rise in the food consuming power of the American people when a period of prosperity is upon them. The present price of 12 cents a pound for New York cheese, so a prominent buyer in the East informed us recently, has been brought about almost wholly by the home demand. Much of the eastern cheese has been bought upon Chicago and other western orders.

As the people grow prosperous and wealthy they consume all the more of the best of dairy products. Still there is a point in price beyond which the demand will not go and we fear the cheese market is close to that margin.

The price of butter is well up for this time of year, but is not, however, excessively high, though relatively lower than that of cheese. The milk that will make a pound of butter will make two and a half pounds of cheese. At that ratio, when cheese is 12 cents, butter should stand at 30 cents. There is, however, with butter to be considered, the double value at least of the skim milk as a by-product over that of whey, so that the skillful farmer gets as good a return in the end from butter as he does from cheese. In addition, the skim milk enables him to carry a much larger number of young cattle and thus increases the fertility of his farm.

One important lesson to be learned from the present condition in the market for dairy products is, that all this much feared over production has not yet appeared.

Those farmers who have hesitated to go into dairying, or being in, have hesitated about making much needed improvements on their farms or buildings or cattle, can see, if they will look, that there is yet a strong and vital demand ahead of them for all the good thinking and working in this line they can summon.

We are yet a long way off from a condition of the market demand for *good* butter and cheese, when it will not pay a handsome profit to produce the same, provided, always, that we use the best modern intelligence in doing it. To be a clear minded, economic producer and handler of good cows and their product is about as sure a way to make good profit as any business that is going.

Several Difficult New York Questions.

And Not Very Satisfactory Answers.

ED. HOARD'S DAIRYMAN:—The answers to the questions from your subscribers which appear from week to week are so instructive that I am going to ask for a few helpful suggestions myself. I have a herd of registered Jerseys, thirty aged cows, fifteen two-year-old and yearling heifers and a couple of bulls. They were purchased with regard to their milking qualities as well as richness and represent several of the very best families—Exiles, King of St. Lamberts, Ida's Rioters, Combinations, and Golden Lads, "close up."

I have built a modern sanitary barn,—cement floors—fitted with water basins, Newton ties, and having weighing room, etc., twin silos, separator, Babcock tester.

Wash room has stone tubs, boiler for heating water and steam box, and bottling cellar has large refrigerator for storing the aerated milk until it is loaded on wagons to be delivered in the village—six miles from farm—at six cents per quart. We make and sell at present 172 quarts and that is not far from the average for past year.

The farm contains seventy-six acres, about forty of which are tillable, and I rent a farm adjoining of forty acres, twenty-five of which are capable of cultivation. We practice soiling, and grow cow peas, soja beans, mangels, barley, rye, oats and peas, millet and a little clover. No grass lands or pasture.

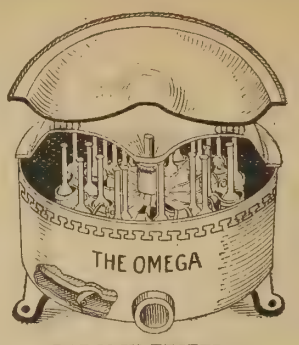
Now as to present prices: Timothy hay (for horses) is worth $22 delivered; clover from western part of state, $16 and scarce; bran, $19; oats, $26.25; middlings, $21; linseed, $35; cotton seed meal, $26.50; corn fodder is three cents a "stout" (weighing from six to nine pounds.)

The village where we retail our milk has a population of about five thousand, and eighteen "milkmen" compete for the patronage. Some of the milk peddled there only brings four cents, but we get six owing to superior quality, bottling and icing it.

Now what I want very much to know is, how many "help" to employ to handle this business at a profit, what duties each should perform and what feeds to grow and which to purchase. I can and do give my personal supervision, and a lot of hard work besides, but the result is not very satisfactory. Had I better turn the management over to a farm manager? Please give me as explicit directions as space will permit and everlastingly oblige. A NEW DAIRYMAN.

Rockland Co., N. Y.

At the prices named for feed and the price received for milk, we confess our inability to see much chance for profit. The former are much too high and the latter too low for the quality of milk furnished and the care bestowed upon it.



Such milk should find customers willing to pay at least ten cents per quart, and in many cities would be eagerly sought for at that price.

From the circumstance that corn fodder (stover) can be had, we assume that our inquirer can raise corn, and, if so, it should be in the form of silage his main reliance for fodder in the future, both for summer and winter. For the forty-seven animals this would require not far from 350 tons, which should be grown on twenty-five acres or less of ground. Soja beans, or cow peas may probably be grown with the corn and siloed with it. Crimson clover should be sown at the time of the last cultivation, and be plowed under the next spring as a fertilizer. Incidentally it may furnish some feed. The balance of the tillable land, after reserving garden and truck patches, may be divided between oats and clover—the clover to furnish hay and the oats to exchange for cheaper feed that will answer as good if not a better purpose. The rotation will be corn, oats, clover, with a portion of land in corn, two years.

We are inclined to protest somewhat mildly, against the questions about help. We suppose it will largely occupy the time of, at least, two men to assist with the milking and care of milk utensils, and care and delivery of the milk, and it is somewhat doubtful whether one other man and the proprietor, although he may do a "lot of hard work," can work the land as intensively as it ought to be worked. It certainly will be necessary at times, to have additional help.

We cannot offer any suggestions in regard to the advisability of getting a "farm manager," except to say there are pleasures and benefits in managing one's own business which cannot be measured in dollars and cents.

The cows do not seem to have been doing very well, as the average yield, with thirty cows giving milk, would be less than thirteen pounds daily, or but little more than half what it should be. It may be that they have not been profitably fed. We suggest that such of them as are fresh, or nearly so, be gradually brought to a ration, composed, say, of 10 pounds clover hay, 10 pounds corn stover, 6 pounds bran and 2 pounds cotton seed meal.

THEIR HOLSTEINS.
Netherland Hengerveld, ...official test 26.66 lbs,
De Kol 2d.....official test 26.57 lbs,
Belle Korndyke.....official test 25.77 lbs.
Helena Burke.....official test 25.45 lbs.
We want to sell 40 cows and heifers and 20 young bulls, bred in the lines above mentioned. Write stating exactly what you want.
HENRY STEVENS & SONS, Lacona, N. Y.

15 CHOICE DAIRY Cows must be sold by November 3d. Five registered Holstein-Friesian cows and ten high grades, ¾ Holstein blood and better. Great producers. Rich breeding. All cows bred to a son of the $1,000 bull Netherland Carl, and almost full brother to the sweepstakes bull at Trans-Mississippi Exposition, 1898. Intelligent dairymen will find them a great bargain at the price they are offered. Write to-day for full particulars. **KARLEN & CO.,** Monticello, Wis.

Markham Manor Farms. Simonsville P. O., Andover, Vt.
Holstein-Friesian cattle bred from the most fashionable butter families, individually large producers, and of the most approved show form. The herd contains seven daughters of Sir Netherland Soldene Clothilde, No. 18390, H. F. H. B., the most remarkable show bull of recent years. Also large English Berkshire Swine from noted prize winning and imported stock. Write for description and prices to **J. A. THORNTON, Mgr., Simonsville, Vt.**

Seeding for Vetches.

Our favorite mixture for green fodder is, as every reader of the journal knows, two bushels of vetches, one of peas and one of oats; the cutting to begin as soon as the peas and tares are showing for bloom, and the land, immediately after the crop is finished, to be broken up and sown with rape. Of course, this green fodder is to be sown in successional patches, and is intended for spring seeding. If, however, the "climate conditions" of NewYork will admit of winter-vetches doing well, we should recommend two and one-half bushels of vetches to one bushel of wheat.

So much superior is the quality of the winter-vetch fodder to that of the larger vetch, that is the spring kind, that many of our best East of England farmers sow the winter kind in the spring.

By the time the vetches sown with rye are fit for cattle-food, the rye will be advanced in life and too sticky to be pleasant eating. People, who have been in London in the early spring, will say: Oh, but I saw carts loaded with green rye and tares (vetches) and the men were peddling the bundles out at the "mews;" true enough, but they are only used as a bonne bouche for the horses, not by any means as a standby, and the horses, tired of their long winter's dry food, find them an agreeable laxative, for this fodder is cut in its earliest green state, and a full meal would soon produce a too relaxed state of the bowels.

As to the large seeding we recommend, it must be remembered that the spring vetch is one-third larger than the winter vetch. One thing is certain, at least to our mind: If you want quick growth of green fodder, you must sow thickly.

In putting in the seed of vetches, the best plan is to use a drill, and to bury the winter mixture of vetches and wheat three inches deep, while two inches will be enough for the spring pulse and tares. Sow the first patch in spring as soon as the snow is gone; the next three weeks after the first, and the third fifteen days after the second sowing. Roll the winter sowing as soon as the ground is dry enough, and the spring and summer sowings as soon as the plant is up.—*Journal of Agriculture.*

Feeding Pumpkins to Dairy Cows.

We find prejudices for and against feeding pumpkins to dairy cows. One man says it will dry up the cows; another man says that it will be all right if the seeds are taken out. But from experience the writer is satisfied that it is a question of cow characteristics rather than pumpkin characteristics. He once tried the experiment of feeding pumpkins to one of his best cows—a milking Durham. She was a perennial milker, in fact, under ordinary treatment she could not be dried up at all, even at calving time. But on being fed with pumpkins in large quantities, she began to fall off in milk, till she was nearly dry, at the same time putting on fat till she was plump and glossy. The pumpkins had to be discontinued for the sake of the milk pail. It was determined to use the pumpkins by feeding them to a poor scrawny cow, lately purchased. It was not doubted that fatness would result, as in the case of the first cow. But no; the more pumpkins she got the more milk she gave, and after several weeks of that kind of high feeding was as poor as ever, but had greatly increased her performance at the milk pail. One cannot, therefore, tell what the effect of feeding pumpkins is by their effect on one cow, or on a number of cows of the same strain of breeding. The owner of a herd of milking Short-horns might find the feeding of pumpkins very detrimental to the continuance of his milk supply, while the owner of a herd of Jerseys might find pumpkins conducive to increased milk production. Individuality counts. —*Farm, Field and Fireside.*

Our Special Elgin Letter.

ED. HOARD'S DAIRYMAN:—But 5,280 pounds of butter were offered for sale on Monday's Elgin Board of Trade. All bids were at 23 cents, but at the close of the call, 3,480 pounds were sold at 23½ cents, this being the only sale. The market was declared firm at 23½ cents. The sale made was:

	Pounds.	*Price.*
Red Clover	3,480	23½c.

The market for the corresponding week of the three preceding years, were as follows:

Oct. 24, '98, 16,500 pounds butter sold at 22 cents.
Oct. 25, '97, 18,840 pounds butter sold at 23 cents.
Oct. 26, '96, 86,460 pounds butter sold at 19@20c.

The New York market, Monday, was reported firm at 24 cents. H. C. B.

Elgin, Ill., Oct. 23.

CONCERNING OUR ADVERTISERS.

DAIRYMEN AND FARMERS

will rejoice to be informed that at last a reliable cure for abortion in cows has been discovered in Robert's Anti-Abortion Serum. It has the added merit of being easily administered. All interested are advised to write to Dr. D. Roberts, Veterinary Surgeon, Waukesha, Wisconsin, for proof of many cures, and full particulars as to prices, etc.

A VALUABLE BOOK ON STOCK PROTECTION, FREE.

The protection of his herds from contagious diseases, among which tuberculosis is chief, is the first duty of a stock raiser. A book that will enable a stockman to protect his stock, his family and the community has been published, and is sent free to anyone, on request, by H. K. Mulford Company, chemists, of Philadelphia and Chicago. This booklet contains simple directions for administering Tuberculin, the use of which is essential, in order to carry out the laws providing for the separation and destruction of infected cattle. This test infallibly gives notice when tuberculosis is present, even in its earliest stages, thus enabling an owner, by separating the infected animal, to preserve its fellows from destruction. There is no danger of producing tuberculosis by the use of Tuberculin. In cattle which are diseased no reaction is noted, and no harm follows.

ED. HOARD'S DAIRYMAN:—Among our recent sales we sold to Manuel Garcia Sedam, of La Piedad, Mexico, a very fine young herd of Jerseys, mostly St. Lamberts. They are the foundation for one of the finest herds in that country as he has spared no pains or money in selecting them. They were nearly all bred to St. Lambert, of Brodhead 46957, or daughters of his, whose breeding is unequaled as his pedigree will show.

We also sold to Mr. Peter S Johnston, of Sylvan, Wis., a valuable pair for a foundation. The bull is sired by St. Lambert of Brodhead and is out of Fannie Bugler 15962, who was in our herd until she was past eighteen years of age. She had a record of fifteen pounds, two ounces of butter in one week. She never had but three daughters and one did not live to be a cow. The others have both made tests, one nineteen pounds, eight ounces, and the other sixteen pounds, one ounce. The cow is also from our best strains of stock and Mr. Johnston will surely be heard from in the Jersey world later. N. N. PALMER & SON.

Brodhead, Wis.

DAIRY MARKETS.

ELGIN, Ill., Oct. 23—Offerings 88 tubs; 58 sold at 23½c. Committee reported market steady at 23½c.

CHICAGO, Ill., Oct. 23—Butter—Creamery, extras, 22c; firsts, 19@20c; seconds, 15½@16½c; dairies, selections, 19c; No. 1, 16c; No. 2, 15c; extra ladle, 14½@15c.

Cheese—Full cream, Twins, new, good to choice, 11¾@12c; Young Americas, 12@12¼c; Swiss, 10@13c; Limburger, 10@11½c; Bricks, 10@12c.

Eggs—City-candled, fresh, cases returned, 16½@17c.

Cattle—The run rather exceeded expectations, and the general market declined 5@10c. Eight loads of 1,379-lb Hereford steers sold at $6.50, which was the top of the market. Five loads of 1,424-lb. steers sold at $6.40, with very few good enough to sell above $6.15. Strictly prime 1,400@1,500-lb. beeves would sell around $6.60@6.75. Native steers averaging 798@1,557 lbs. sold at $4.10@6.15; bulk, $4.85@5.80, including 1,300@1,450-lb. export cattle at $5 30@5.60; grass Western steers sold at $3.80@5; bulk, $4.30@4.50; Western cows and heifers, $3.10@4.50; grass Texas steers, 1,031@1,065 lbs., $3.80@4, native cows, $1.50@4; bulk, $2.60@3.10; heifers, $2.70@5.35; bulk, $3.35@4.10; bulls, $2.50@4.15; bulk, $2.90@3.40; stags, $3.50@4.75; veal calves, $6.@7.50, and feeding cattle, $3@4.60; bulk, $3.50@4.05.

Bran—Easier, and demand light, with a sale of 1 car at $12.25 per ton.

MILWAUKEE, Wis., Oct. 23—Butter—Creamery—Fancy Prints, per lb., 23½c, extras, 23½c; seconds, 20@21c; imitations, 19@20c Dairy—Selections, 18@20c; lines, 16@18c; ladles, 15@16c. Market weak and quiet, particularly creameries; receipts, 10,445 lbs.

Cheese—American Full Cream—October Flats, 11½@12c; July, August and September, 11½c. Brick, 11½@12c. Limburger—New choice, per lb., 11@11½c. Swiss—Drum, 12½@13c; Block, 12½@13c; No. 2, 10½@11c. Market easy; receipts, 16,770 lbs.

Eggs—Fresh per doz., 16½c, loss-off cases returned. Market quiet and easy; receipts, 206 cases; supply almost entirely cold storage, which do not command prices quoted for fresh.

FOND DU LAC, Wis., Oct. 23—Offerings 602 Twins and 490 Daisies; market quiet at 11½c@11⅝c for Twins.

MUSCODA, Wis., Oct. 23—Offerings 750 boxes Twins; car lots, 11½c; local lots. 11c.

ST LOUIS, Mo., Oct. 23.—Butter—Steady; creamery. 19@24c; dairy, 14@19c.

Eggs—Steady; 15c.

KANSAS CITY, Mo., Oct. 23 —Butter—Creamery, 19@22c; dairy, 16c.

Eggs—Fresh, 14c.

CINCINNATI, O., Oct. 23.—Butter—Firm.

Cheese—Firm; good to prime Ohio flat, 12½c.

Eggs—Firm; 15c.

BALTIMORE, Md., Oct. 23.—Butter—Firm; fancy creamery, 24c; fancy imitation, 19@20c; fancy ladle, 17@18c; good ladle, 16c; store packed, 14@15c; rolls, 15@17c.

Cheese—Firm; large, 13@13¼c; medium, 13@13½c: small, 13¾@13¾c.

Eggs—Firm; fresh, 18@19c per doz.

NEW YORK, Oct. 23.—Butter—Creamery, Western extras, 24c; firsts, 21½@23c; state extras, 24c; firsts, 22@23c.

Cheese—State, full cream, small colored fancy, 12¾c; white, 12¾c; large colored fancy, 12¼c; white, 12@12¼c.

Eggs—State, Pennsylvania and Western, 21½@20c.

PHILADELPHIA, Pa., Oct. 23.—Butter—Solid-packed separator creamery, extras, 24c; firsts, 23c; seconds, 19@22c, imitation creamery, extra, 18c; firsts, 16c; seconds, 14c; ladle-packed, extra, 16c; firsts, 15c; seconds, 14c; print butter, creamery, extra, 24c; firsts 23c; seconds 19@20c.

Eggs—Pennsylvania and near-by, 20c; Western, 19½@20c; Southwestern, 18½c; Southern, 18c.

The Difference Between Separators.

The difference between Cream Separators is greater and more material than the difference between almost anything else that could be suggested.

The difference is not merely one of choice, kind, style, color, shape, manner of handling, method of operation, or even style of construction or durability, as would be the case with almost anything else that might be thought of.

On the contrary, the difference between the "Alpha" disc and all other cream separators is one of dollars-and-cents results every time milk is put through the machine, and in the course of a week, a month, or a year these differences amount up into almost incredible figures.

There is nothing difficult to understand about the differences or as to how and why they exist. The patent protected "disc" system of milk-strata separation, which can be used only in the "Alpha" machines, tells the whole story. Facts, figures, and reasons are given with full illustration in a De Laval catalogue, which may be had for the asking.

The De Laval Separator Company,

WESTERN OFFICES: Randolph & Canal Sts., CHICAGO.
GENERAL OFFICES: 74 Cortlandt Street, NEW YORK.
BRANCH OFFICES: 1102 Arch Street, PHILADELPHIA.

BALTIMORE MARKET.

BALTIMORE, Oct. 19—Butter—It is the general feeling and finds form in expression that this is the dullest October in the experience of the trade. To arrive at this conclusion is easy, much easier than to assign a satisfactory reason for the condition. The receipts, it is true, are now and have been, unusually light and the increase in population is in commendable ratio by no means below the normal, so why the consumptive demand does not require more to satisfy it than goes through the hands of the dealers is a mystery, and a problem to which the only solution is, without doubt, quite unsatisfactory to the receivers. The advanced price of fresh extras has put that grade beyond the reach of many, thereby making the scant supply sufficient for the demand. The weather has been so warm, along with this other fact, that there have been but few calls for June creameries. Imitation creamery and ladles remain scarce and in good demand. The receipts of rolls are not large, but the weather has had a bad effect upon many of the small lots, and buyers use this to their advantage as regards price.

Creamery Separator, extra, 24c; firsts, 22½@23c; seconds, 20@21c. Creamery Gathered Cream, extra, 21@22c; firsts, 19½@20c; seconds, 19c. Creamery Ohio, extra, 21@22c; firsts, 19½@20c; seconds, 19c. Creamery Imitation, firsts, 17@18c; seconds, 15½@16c. Iowa & N. W. Ladle, firsts, 16@17c; seconds, 15c. Ohio & Indiana Ladle, firsts, 16@17c; seconds, 15c. Ohio Rolls, extras, 17c; firsts, 15@16c; seconds, 14c. W. Va. Rolls, extras, 16c; firsts, 15c; seconds, 14c. Ohio & W. Va. Storep'd, firsts, 15c; seconds, 13@14c. Creamery Blocks (2 lbs), extras, 25½@26c; firsts, 24@25c; seconds, 22@23c. Creamery Prints (½ lb.), extras, 25½@26c; firsts, 24@25c; seconds, 22@23c. Md. Va. & Penna Prints, extra, 21c; firsts, 20c; seconds, 18@19c.

Cheese—Receipts light, demand good; market firm with prospects of higher prices in the near future.

N. Y. State—Cheddars, fine, 12½@12¾c; choice, 12@12¼c; fair, 11¾@11¾c. Flats, fine, 13@13¼c; choice, 12¼@12¾c; fair, 12@12¼c. Small, fine, 13½@13¾c; choice, 13@13¼c; fair, 12¼@12¾c. Ohio—Flats, fine, 12¾@13c; choice, 12½@12¾c; fair, 11½@12c. Ohio Picnic, fine, 13@13½c; choice, 12½@12¾c; fair, 11¾@12¼c Skims, fine, 10@11c; choice, 9@9½c; fair, 8¾@8½c. Swiss cheese, fine, 12@12½c; choice, 11½@11¾c; fair, 10½@11c.

Eggs—Choice fresh eggs are in rather light supply; for this kind of stock there is a good demand at 17½c. When we say fresh eggs we do not mean held or mixed eggs; please bear this in mind. Cold Storage—The supply is ample for the demand, which is confined principally to choice marks.

301 Exchange Place. G. M. LAMB & BRO.

READING NOTICES.

All Reading Notices under this head are at the rate of 25 cents per line.

Wanted—Situation as foreman or manager on a first-class dairy farm. Can furnish full references as to ability and character. Address "L" St. Ives Park Farm, Fullerton and 64th Ave's, Chicago, Ill. 36-2

For Sale—Registered Guernsey bull, dropped Dec. 14, 1898. F. W. DAWE, Mineral Point, Wis.

For Sale—Holstein Friesian bull No. 24305, calved Dec. 16, '95, butter bred, weight 1900 lbs., also H. F. bull calf, son of the above, 6 mo. old. Prices reasonable. F. E. LAWSON, Walworth, Wis. 36-2

A Baby De Laval Separator No. 3, capacity 600 lbs. an hour, 30-gal. churn, butter worker, 6-bottle Babcock tester, shafting, pulleys, belts, etc. Price $100.00. Separator good as new and cost $200.00. E. R. BALSLEY, Troy, Wal. Co., Wis. 34-tf

Herdsman wanted who is a good feeder and milker, and wants steady employment. For particulars address A. J. DAUGHERITY, Streator, Ill. 32-tf

For Sale—Three fine Guernsey bull calves, by SEBASTIAN HELLER, Calumetville, Wis. 35-tf

Wanted—An energetic young man with a thorough knowledge of handling milk, to manage a milk depot in a prominent Virginia town, handling about 300 gallons per day. Price and satisfactory references required. Address F. C., care Hoard's Dairyman, Fort Atkinson, Wis. 36-2

Field Glass—$10; originally cost $30: Very powerful and nearly new; 26 ligne binocular glass; not a cheap affair, but of best French make, and will send it for examination by addressing Box 392, Cincinnatti, Ohio.

For Sale—Sharples separator of 300 lbs. capacity, in good condition. Business has out grown its capacity. Price $50. C. I. WEST, Station I, Cincinnati, Ohio.

New upright 6 H. P. engine and boiler, been used 3 days. Warranted in perfect condition, cost $150, will take $100 cash. J. P. ASHBAAGH, Edgerton, Minn.

Wanted—At once a married man of family with three milkers. Must have experience in handling and feeding dairy cows. No preference as to nationality, only that he must have industry and dairy knowledge. Good wages, schools, church, good dwelling to live in, all convenient. Address the undersigned, A. D. SPRAGUE, Caledonia, Minn.

Wanted—Good reliable man to work in a creamery as second hand. Man with some experience is preferred. Address HIGHLAND CREAMERY CO., Kinwood, Wis.

To Los Angeles and Southern California.—Every Friday night, at 10:35 p. m., a through Tourist Car for Los Angeles and Southern California, leaves the Chicago, Milwaukee & St. Paul Railway Union Passenger Station, Chicago, via Omaha, Colorado Springs and Salt Lake City, for all points in Colorado, Utah, Nevada and California. In addition to the regular Pullman porter, each car is accompanied by an intelligent, competent and courteous "courier," who will attend to the wants of passengers en route. This is an entirely new feature of tourist car service, and will be appreciated by families or by ladies traveling alone. Particular attention is paid to the care of children, who usually get weary on a long journey. These tourist cars are sleeping cars supplied with all the accessories necessary to make the journey comfortable and pleasant, and the berth rate (each berth will accommodate two persons) is only $6.00 from Chicago to California. Ask the nearest ticket agent for a tourist car folder, or address Geo. H. Heafford. General Pass. and Ticket Agent, Chicago, Ill. 37-sp

Farm Dairy Accounts.

ED. HOARD'S DAIRYMAN:—Complying to the request of C. D. Rust, October issue, page 677, while I am neither farmer nor dairyman, (keeping a few cows and chickens) I have been using the attached form for accounts for some time, and find it quite suitable for any of my purposes, and can be enlarged or contracted to suit.

I use a book long enough to permit of thirty-one days' record, and space above for heading, and space below for remarks. I use a separate book for cows, hens, feed, etc., and carry monthly totals of each to a separate book, showing only monthly totals of herd or pens, and footing them gives grand yearly totals. But if a book of sufficient width were kept, all could be entered upon one page. This, however, is only a matter of taste. CHAS. LYNCH.

Chicago, Ill.

Remarks:

Home Grown Rations.

A Pennsylvania Problem,

ED. HOARD'S DAIRYMAN:—Wishing to grow as much of the feed for our cows as possible on the farm, I had thought that a rotation of corn, wheat, and clover would be about the right thing.

How near a balanced ration could be made from silage and clover hay? Would there be any danger of having the silage too rich, i. e., contain too much grain if it were planted only thick enough to mature fair sized ears, on ground that produces seventy-five to eighty bushels per acre.

What is the comparative value of ground flax seed and old process oil meal? Would sun flowers be profitable to raise for feed for cows?

I am anxious to raise something to furnish protein for them so as to avoid having to buy expensive feeds. R. G. M.

Woodbine, Pa.

One should raise those crops for which his soil and climate are best adapted, giving preference, other things being equal, to such as are best for feeding. It would be poor policy to feed corn or oats when either could be exchanged for some other feed answering a better purpose and worth less. But, as a rule, the farm should be stocked so that the equivalent of all the feed raised could be made over into beef or milk or wool and mutton, or horses, hogs, or fowls, and in this way conserve fertility and gain a manufacturing profit.

The rotation suggested would prove a good one in localities where wheat and corn can be profitably grown, but one could hardly expect to rely exclusively upon corn and clover for cow feed. For example, a cow weighing one thousand pounds could not be expected to eat more than about thirty pounds of silage and twenty pounds of clover hay per day, and these would furnish not far from twenty-five pounds dry matter containing digestible nutrients as follows:

Protein	1.75 lbs.
Carbohydrates	11.36 "
Fat (ether extract)	.55 "

The silage might possibly be increased to forty pounds, but this would still leave the protein and fat deficient.

In our opinion it would be more profitable to drop ten pounds of the clover hay and add eight to ten pounds of grain—say four pounds bran, four pounds gluten feed and two pounds corn chop. Of course these ten pounds of grain would cost more than ten pounds of hay, but it is the simple truth that milch cows cannot do their best when receiving only coarse fodder, any more than a horse can do its best without any grain. A cow that is giving from twenty to thirty pounds of milk per day is using up as much energy as a horse at moderately hard work, and should be fed with the same care and discretion. A good cow in her line, like a good horse in his line, will respond to proper feed up to the limit of her capacity; and not until this point is reached and maintained from day to day, due regard being had to the changes incident to prolonged lactation, can it be claimed that the cow is being economically fed. A cow can subsist and give some milk when limited to straw or cotton-seed hulls for feed, but there is no resulting profit. A diet of silage and clover hay is much better than most cows have—we are sorry to say—but it is not the best or most economical for cows that have not been milking six months or more. The cow makes milk from the feed she receives—no feed, no milk; poor feed, little milk; good feed, much milk.

For the relative feeding value of flax seed and old process linseed oil meal, as well as other feeding stuffs, see the table published in this issue.

There is a Limit, but it is Not Yet in Sight.

A Feeding Problem from Mississippi.—Milking Tubes.—Cotton Seed Meal for Calf Scours.

ED. HOARD'S DAIRYMAN:—Is there a limit to human endurance? After carefully reading the DAIRYMAN for two years, seeing with what persistency your subscribers continue to ask for ration formulas, and with what persistency you continue to answer, we are almost forced to the conclusion that there is no limit, at least in your case. Hence we are emboldened to ask you to suggest a proper ration out of the following:

1st Ration: Wheat bran, $16 a ton; cotton seed meal, $17 a ton.

2nd Ration: Wheat bran and cotton seed meal, as above, and corn meal at $20 a ton.

3rd Ration: Wheat bran, cotton seed meal and corn meal, as above, and cow pea meal at $20 a ton.

In either of the above cases, each cow will have a daily allowance of twelve pounds cotton seed hulls (worth $3 a ton) and ten pounds, only, of Johnson grass hay; cows weigh from 600 to 900 pounds. Hay worth $9 a ton.

Would clean, shelled oats, unground, which I can buy for thirty-eight cents, be of any value, added to the other materials named; or are such unground oats injurious to milk cows?

So much on rations. Will the milking tubes we see advertised in HOARD'S DAIRYMAN, and which we so often see recommended by the "V. S." in your columns, cause the milk to flow from the udder voluntarily, or is manipulation of the udder, or teat, by the milker necessary?

And now about calf scours: I frequently have the scours among my calves, caused by either the quantity or quality of milk they have taken.

Some two years ago, it occurred to me that as cotton seed meal was an astringent, it might be beneficial in scours. Since then, I have had occasion to resort to it several times, and have never had a case that failed to yield to the treatment. Ask some or your northern, as well as southern, dairymen to try this, and report results through your columns.

Amory, Miss. L. H.

One seldom tires of the work in which he is profoundly interested, and the writer who has answered most of the feeding inquiries in recent years, has to confess that the new phases of the general subject, presented in the communications received, act as a continual stimulant and tonic. He tries to put into the answers, as a rule, something more than a mere formula, by offering pertinent suggestions as to the manner of feeding, reasons for preferring one class of feeding stuffs to another, objects of feeding, etc.

We submit below three formulas, as suggested, and would like to discuss them at length, but want of space forbids:

NO. 1.

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrient: Protein.	Carbohydrates	Ether Extract
10. lbs. Johnson grass hay	8.77	.24	4.79	.07
12 lbs. C. S. hulls	10.67	.04	3.97	.20
6 lbs. bran	5.29	.75	2.32	.18
3 lbs. C. S. meal	2.75	1.12	.50	.27
Totals	27.48	2.15	11.58	.72

NO. 2.

Hay and hulls as above	19.44	.28	8.76	.27
5 lbs. bran	4.41	.63	1.93	.15
2 lbs. C. S. meal	1.84	.74	.34	.18
2 lbs. corn chop	1.78	.16	1.33	.09
Totals	27.47	1.81	12.36	.69

NO. 3.

Hay and hulls as above	19.44	.28	8.76	.27
3 lbs. bran	2.64	.33	1.16	.09
2 lbs. corn chop	1.78	.16	1.33	.09
2 lbs. cow peas	1.70	.37	1.08	.02
2 lbs. C. S. meal	1.84	.74	.34	.18
Totals	27.40	1.93	12.67	.65

In each of the above formulas there is more dry matter than is required, and in our opinion a larger quantity of cotton seed hulls than a milch cow ought to be required to work over and digest. It takes energy to digest food and hence easily digested feeds require less expenditure of energy than those not so easily digested. And there is no other source than feed from which energy can be had. Therefore we advise cutting down the hulls by a least 4 lbs.

When this is done our preference would be for formula one.

One could not afford to feed oats at the price named, unless in special cases where one was striving for a large yield, regardless of cost.

The milking tubes are expected to work automatically, but gentle manipulation of the udder when in use would be advisable.

Thanks for the suggestion of cotton seed meal as a remedy for scours, but there should go with it the caution that constant feeding of cotton seed meal to calves may result disastrously.

Actual and Babcock Butter.

Prof H. H. Wing, in a reply to a letter in the *Country Gentleman* makes the following vigorous answer to the old claim that fat in the milk is not butter.

The statement is made that "one side holds that the cow should receive credit for every iota of butter fat indicated on the Babcock test tube, and is composed of those who do not make butter, but who deal in milk and cream." This is untrue. Very few dealers in milk and cream pay any more attention to the Babcock test than they have to. If they did, the average consumer of milk and cream would be much better off. But on the other hand, thousands of men who make butter, buy millions of pounds of milk daily, and credit the cow "for every iota of butter fat indicated on the Babcock test tube," because it shows exactly what the milk is worth *to make into butter*.

The old idea that the butter must actually be made in order to credit the cow with it, is of course, strongly brought out, but in the following quotation the cat is very neatly let out of the bag, and the whole animus of the article shown up: "However that may be, the actual amount of *butter* is his (the dairyman's) standard, as it is this which he sells. He is paid a certain price for a pound of butter without inquiry as to whether it contains 80 or 85 per cent of fat." Here is the gist of the whole matter. Our writer wants the record to be based not on *fat*, which is a certain definite substance easily capable of being determined and measured, but on *butter* "without inquiry as to whether it contains 80 or 85" or some other percentage of fat. In short, the writer would have a cow establish a butter record on any uncertain mixture of water, fat and salt that an unscrupulous owner may bluff off on a credulous public as butter. He makes a great virtue of decrying credit for what might have been done, and asks: "Can we honestly expect to credit a cow with butter whose milk was sold at so much per 100 lbs to some milk dealer and retailed about town at so many cents per quart, without regard to the amount of butter fat contained in the same?" Instead of "assuredly not," I should reply "certainly," and would ask further, is it fair to say that a cow that has produced 40 lb. of milk containing 5 per cent of fat daily for a week has no capacity for butter-making, because a lot of hungry boys and girls drank up all the milk, so that the good wife had no chance to make any butter?

No cow has ever made any butter, (unless perchance some enterprising dairyman may have occassionally led her upon a tread power to revolve the churn). She has simply secreted a fluid containing a certain amount of fat, six pounds of which are required to make and will make seven pounds of butter with very slight variations. There can be no question that the quantity of fat secreted indicates the butter capacity of the cow, no matter what is done with the milk, our learned author to the contrary notwithstanding.

As to what is said concerning the possibility of fraud in making records, there can be no question. No record or test is any better than the man behind it. An *honest man* is necessary in any case, but the opportunity for fraud is undoubtedly made greater where the milk is separated, the cream ripened and churned and the butter made, than where a fat test is made at once.

What the Hog has Done for the Farmer.

The editors of The *Stockman and Farmer* have proposed the above text, thinking perhapes that I might try to do justice to the subject. But how could I or any one else? It is the story of millions untold, the history of the great American hog. From the days of our Pilgrim Fathers he was the companion and supporter of the pioneer on his journey westward, until his abode is in every state and territory of the Union from the Atlantic to the Pacific. On the Plains and in the Rockies (the home of the buffalo, the antelope and the grizzly) he reigns supreme, at home in every clime, the ever true abiding friend of the pioneer. It would give volumes of interesting reading if farmers had left behind stories of his individual benefit, ever dividing the hardships, with a contented grunt for the smallest favors. It would be the story of millions, that the hog laid the foundation of their happy, free and independent homes—if we were not so forgetful and did not ascribe success to our own individual efforts, forgeting that in the mighty struggle he divided

Results Make Reputation.

Singer Machines, either lock-stitch or chain-stitch, are the successful result of long experience and constant improvements in the endeavor to make nothing but the best sewing-machines for family use. The accomplishment of this result requires six of the largest, best-equipped factories in the world, and the best inventive talent of the age. Twelve thousand workmen are employed in these factories. Experience counts with THE SINGER MANUFACTURING COMPANY. The average term of employment among these workmen exceeds a decade.

Sold on instalments.
Old machines taken in exchange.

The Singer Manufacturing Co.,
"Sewing-Machine Makers for the World."

the hardships of poor shelter, storms and starvation. It was he that furnished the main staple of wholesome, nutritious meat and the necessaries of life; he paid for shoes and winter garments; it was he that paid for the first cow, he that paid for the first plow; it was he that furnished the money for taxes, however small they were, but they were cash. When other products had to be sold for half cash and half trade he demanded cash and it was ever forthcoming. He walked to his burial and future home and liquidated the note on the team; he bought the school books; it was he that paid for the material for stable, for horses and cow, while he without a discontented grunt took his abode in a straw pile, and his mate brought forth lusty litters, any one of which would excell the three-year-old steer in value in ten months. It was he that paid the doctor bill; he that lighted up the first Christmas tree and furnished the toys for the kids, the first merino dress, calico and trimmings, and caused the smiles and tears of joy. It was he that replaced the log hut, the sod house, the shanty, with comfortable and often stately homes. He paid for the education at city schools, and the professional boy forgets that his superior education is somewhat due to the American hog.

The wheat farmer of the west, that trusted his all in wheat until it went below the cost of production, found in him his savior—he paid his way, ten pounds per bushel, live weight. His presence changed agriculture on the plains; he ate alfalfa, clover and bluegrass. Corn was no longer a drug on the market, but a remunerative freight product for the railroad.

It was no longer fuel—he replaced it with coal and gasoline. He brought about mixed husbandry. Go where you will, if you find him intelligently cared for with a liberal hand, the farmer's reward is sure to come.

In 1898 he found his way to distant shores in—

Live hogs	$ 110,487
Bacon	46,380,9 8
Hams	18,987,525
Pork, fresh	815,075
Pork, pickled	4,906,961
Lard	39,710,672
Total	$110,811,638

American farmer, read, think, stick with intelligence to the American hog; better his condition, stick to him as he sticks to you, brother-like. They tell you that he is not what he should be, they show you figures of sales and exports, but all sink into insignificance in comparison with the American hog. —THEO. LOUIS, in *National Stockman and Farmer*.

The Low Test.

At nearly every institute attended last week by Professor Cottrell and myself, the question was asked: "What is the reason our milk tests 2.6 per cent one month and the next month, under exactly (?) the same conditions, it tests 4 per cent or more?"

There are a great many things that affect the test so that we can not point to any one thing as doing it. In the first place, the conditions are never "exactly" the same; the pasture may be better one month than another, the weather may be cooler or warmer, perhaps you encourage the cow less with the milk stool, or perhaps the boy who brings them in does not get them so much excited. All these things, and many more, influence the per cent of butter fat. Kindness is sure to be rewarded by an increase in both the per cent of butter fat and also in the milk yield; whenever you abuse the cow either by a sharp word, the milk stool, or by running her, you are taking money out of your pocket by decreasing the per cent of butter fat and also the yield of milk. Whenever the cow suffers for lack of food, water, or proper care there is a decrease in the amount received from her.

There are other reasons why your test may be lower one month than another. When the milk is warm it churns very easily so that when you send your milk to the station in cans only half full they will be partially churned when they get there. There is no way of getting a fair sample of such milk, for the butter fat that is churned is lost, both to the patron and to the creamery man. If you have a can and a half to send, fill one can full so that you will be sure to have that much that will not be churned. Keep the milk as cool as possible as it does not churn so readily at a low temperature.

If you do not want a low test do not take the first milk yourself and let the calf have the last. The first milk often tests as low as one-half of one per cent, while the last will test 10 per cent to 12 per cent. Don't skim all your milk before you send it to the station and then expect it to test 6 per cent.

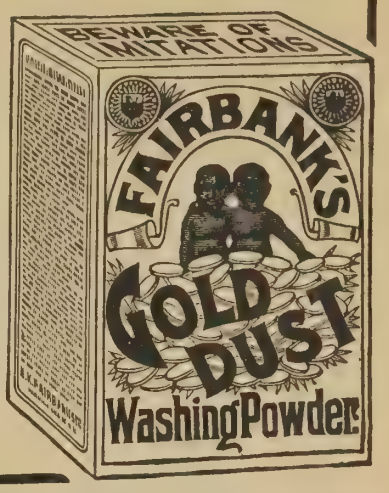
To the creameryman I would say, keep all samples of milk from churning if possible; good tests can never be obtained from a churned sample without the use of ether and this is too laborious a process for you. It is claimed by some that simply heating the milk to a temperature that will melt the butter fat will answer, but my work in this line convinces me that satisfactory results can never be obtained in this manner.

J. A. CONOVER, in *Kansas Farmer*.

National Creamery Buttermakers' Association.

ED. HOARD'S DAIRYMAN:—President Boardman informs me that he has appointed the following gentlemen to serve on the executive committee of the National Creamery Buttermakers' Association for this year: Geo. E. Haskell, of Nebraska, H. M. Brandt, of Kansas, and F. B. Fulmer, of Wisconsin.

President Boardman took into consideration the fact that last year Illionois, Iowa and Minnesota were represented on the committee and as South Dakota has the vice president, thought best to appoint members from those states not represented last year.



The new members of the committee are well known and popular among the buttermakers. Mr. Haskell is president of the Beatrice Creamery Company, and is always working to advance the interests of the creamery trade; Mr. Brandt learned his trade in a Lancaster county, Pa., creamery and came from there to Kansas some ten years ago, where by his ability and industry he has built up one of the most successful creameries in that state; Mr. Fulmer who is buttermaker and manager of the Ettrick (Wisconsin) Farmers' Creamery, is well known throughout the west as the former instructor of creamery buttermaking in the Wisconsin, Dairy School.

The committee will meet at an early date to decide on the next meeting place, which beyond a doubt will be Lincoln, Neb., that place having received the popular endorsement at the Sioux Falls Convention, besides having made the most liberal offer received from any city for the holding of the next National Convention.

Removing Placenta.

ED. HOARD'S DAIRYMAN:—I am always interested in the DAIRYMAN, and especially the veterinary column. On page 701, Dr. Horne gives method for removing placenta with the hand. We have had several cases of retained placenta in our herd, so will give our method, which has been very successful.

Would advise every one to prevent this trouble, if possible, as it takes from one to four hours of the most arduous labor. After waiting two days(not longer)and the afterbirth has not removed, I dress in old clothes, leaving the right sleeve off, then wash hands and arms in warm water, into which a few drops of carbolic acid have been dropped; next grease right arm to shoulder with vaseline. I then grasp protruding end of placenta with left hand, and insert the right hand and arm and gently peel off the afterbirth from the cotyledons (toad stool like projections connecting womb to placenta) with the fingers. This is a tedious job, as there are from sixty to one hundred and fifty of them. They must all be detached so in withdrawing the membranes, the womb will not be lacerated. The reason for waiting two days is to allow the membranes to soften so the cotyledons can be peeled off more easily.

In cases of abortion, have found it almost impossible to remove the afterbirth even in two days after calving or aborting, though it is best not to wait longer than two days as the os may close so as to exclude the hand entirely. A. J. N.

Valley Mills, Ind.

No Hood Farm Cows Died at Toronto.

ED. HOARD'S DAIRYMAN:—We have had many inquiries as to whether we lost any cows at Toronto, and it has even been reported that as many as eight from our herd died. In justice to ourselves we would ask you to insert the following letter from Dr. Bell, assistant Secretary of the Toronto Exposition:

C. I. Hood, Esq., Proprietor Hood Farm, Lowell, Mass.—Dear Sir:—This is to certify that the prizes awarded to Hood Farm, Lowell, Mass., on Jerseys and Berkshires, were paid in full. None of their cows or hogs died. A. W. BELL, Assistant Secretary.

All our stock has arrived home from the fairs in safety. They left St. Louis Sunday noon, Oct. 8, and arrived in good condition Saturday, Oct. 14th. Oonan 12th, one of the heifers in the herd, calved on the road. Both she and her calf are doing well.

Lowell, Mass. HOOD FARM.

Compel Us to Eat Strong Cheese.

ED. HOARD'S DAIRYMAN:—In last week's issue the writer of Northern New York Pencillings wonders why more people do not eat cheese; I am actually surprised that so much cheese is eaten. What people like about strong, sour cheese I can't see, and there are a multitude of others of the same opinion as myself. At all the boarding houses that I have been at, not one person in ten would eat cheese, and they said only because of the rancid, sour taste. Let makers put out cheese with a delightful flavor similar to that of extra creamery butter and a great many people will live on cheese. It has not been my good fortune to get any of this mild flavored cheese but once, several years ago, and I cannot help but remember how good it was. I tasted all the high scoring butter at the National Butter Show, Topeka, Kans., 1898, and none of it was as good, to my taste, as that remarkable cheese.

Why do not makers make a mild brand of cheese, even if they do have to make the other. F. Z.

Kirksville, Mo.

A Round Barn and Silo.

ED. HOARD'S DAIRYMAN:—Being one of many readers of your valuable paper, the only periodical I am interested in, I wish to say that so far I have never felt to be a burden to you, having always found plenty of instruction and beneficial reading matter contained therein; but would be pleased if you would give a sketch of a round silo, thirty by thirty-five feet deep, with a gangway, seven feet wide around, and stalls for cattle around this.

How many cattle could be placed here?

How many tons would the silo hold?

How many cattle could be fed from this for one year?

Could it be fed fast enough to the stock the barn would hold?

How many acres of land would it take to raise corn enough to fill it?

Also would like to know what you think the result would be from feeding silage, malt sprouts, hay and corn meal to Holstein cattle. J. P., Sr

Erie Co., N. Y.

A silo of the dimensions specified would be all out of proportion, and it would be of little avail to publish plans for such a structure. A building of the dimensions specified would allow stable room for forty cows, after allowing for necessary passage ways, and if each cow was allowed forty pounds of silage, each day in the year, a silo with a capacity of 300 tons would be all sufficient. A silo thirty feet in diameter and thirty-five feet deep would easily hold 650 tons, or more than twice as much as forty cows would need.

One could not make a satisfactory ration from the feeds named, for the reason that as a rule cows will not eat more than three to four pounds of the malt sprouts per day, and hence the protein could not be brought up to the proper amount.

J. P. BRADBURY. Pomeroy, Ohio

Facts About Fabius Creamery.

The Fabius Creamery was in need of more separators last summer. For the purpose of obtaining the best, the United States and the De Laval were set side by side for a 30 days' test, the Fabius Creamery insisting that no agent or representative should operate or test either machine. At the end of the 30 days the order was given the United States, because it did more thorough separation. How ridiculous for Mr. Hamilton, the secretary, to now claim that it was because the De Laval Co. held to the list price and the United States did not.

This statement of Mr. Hamilton is not correct. The De Laval agent offered large discounts and made desperate efforts to get the order.

We have before us a letter from an officer of another New York creamery who states that the De Laval offered them a discount equal to 37½ per cent. from the list price.

We have a statement from another party that the De Laval offered to put an Alpha Separator in their creamery without charge. They would not give it to them, but they might use it indefinitly. So much for prices.

The facts are we were paid as much cash as was named in the last contract with the De Laval Co. that it should be paid, and this cash payment to the De Laval Co. was dependent upon the De Laval machine making enough more butter over the United States to make the amount good and in case it did not there was no money to be paid to the De Laval Co. We challenge them to publish the contract.

As the United States was awarded the order for the three new separators on June 27th our representative gave it no further attention, except to set up and start the machines. The machines were set and no complaint was made —everything was satisfactory. Not until six weeks after did we know that the De Laval Co. had had two special agents working on the directors there for weeks to upset and counteract their defeat, if possible. This was done secretly and with the understanding that the United States Company should not be advised.

We did not learn, as above stated, of these movements for about six weeks and not until the De Laval agents had succeeded in getting a contract for another special test to last six days only, in which the De Laval agent was to have the privilege of conducting the test of the United States and the De Laval also, and no United States representative should be present, and from these tests of the two machines for six days was the De Laval to prove the claim that it would pay for itself and thus cost the Fabius Creamery nothing.

As soon as the above facts were learned, which was not until only the six days' tests were nearly over, the United States agent appeared and requested that he might have the privilege of overseeing the operating of the United States, to see that it was properly run, and send samples of the skimmed milk to the State Chemist for analysis.

To this request the De Laval agent objected and said: "The De Laval Co. had everything to lose and nothing to gain and he should simply stand by the contract." The directors at this time were in session. They then examined the contract and stated that it was so worded that they were in the power of the De Laval Co. and could not allow the United States agent to oversee the operating of the United States machine unless the De Laval consented.

Just think of a creamery company being caught in any such contract as that.

Every director admitted that the tests for the 30 days of the United States were many of them .02½ of one per cent. and that none of them were over .05 of one per cent. A request was then made that they give a copy of the records of the United States tests for these 30 days.

To this request director Knapp, who all through fought for the De Laval people as fiercely as any agent could, objected and he was seconded by Mr. Hamilton, the secretary, who said he "DID NOT THINK IT WOULD BE WISE TO GIVE THE UNITED STATES SUCH A STATEMENT AND THEN TURN AROUND AND BUY THE DE LAVAL SEPARATORS. IT WOULD LOOK TO THE PUBLIC AS THOUGH THEY HAD BEEN BOUGHT." We wonder what the reader thinks of that statement.

The United States had beaten and now they refuse to give the records, because "it would give the public the impression that Fabius was bought up if they put in the De Laval. Is not this very transparent? Director Knapp, who kept the records, later stated that they had been destroyed. Why were they destroyed? There could be but one reason—it was because they proved that the Uuited States had beaten and they were now caught in a trap and did not wish to be exposed.

The operator of the machines was, for some reason unknown to us, an ardent De Laval partizan and worked his fires and De Laval machines to favor them. At one time when a sample of skimmed milk was to be taken from the Alpha he turned on more steam and increased the speed several hundred revolutions and as soon as the sample was taken he turned it off again.

He knew it was dangerous to run it at a high speed too long. Too many accidents have happened to that machine. We do not know how many times he operated the Alpha in this way. It is fair to presume, as he did it once, he would do it many times.

After Mr. Hamilton, the secretary, had given his figures at a directors' meeting (a part of which appears in his letter published by the De Laval Separator Co.) a vote was taken. THERE ARE SEVEN DIRECTORS. FOR THREE BALLOTS THE VOTE STOOD A TIE, ONE DIRECTOR NOT VOTING.

The fourth vote there were three votes for the De Laval, two blanks and two nays. From this it would seem that the directors did not put much confidence in the figures. And the De Laval won only on three votes out of seven, two refusing on the fourth ballot to vote.

The De Laval Company is welcome to all the glory they can get out of such methods.

We are sure that all fair-minded persons will concede that a company that has to resort to such methods admits that their machine cannot win on fair and honest tests.

Mr. Hamilton, the secretary, estimates a large gain for the De Laval on their one-sided tests, where the De Laval agent was permitted to manipulate the United States with a partisan operator to help him.

Mr. Hamilton in his statement is very particular to leave out the figures of the tests of the several separators and says, "The tests proved to us" so and so. THE FACTS ARE THAT DURING THE TESTS THE DE LAVAL PUT FIVE DIFFERENT SEPARATORS INTO THE FABIUS CREAMERY IN ORDER TO GET THREE THAT WOULD DO PASSABLE WORK.

Now let us look at the facts based on the figures:

The first test of thirty days the United States did the most thorough skimming and got the order for three separators, which were promptly paid for.

The second test of six days, which was intended to be conducted without the knowledge of the United States people, the average test of skimmed milk from the three De Laval separators was .055 of one per cent, but the De Laval agent claimed that as one separator did poorer work than the other two, it should be left out and the tests of the two others only be accepted. This claim of the De Laval agent was allowed and only the average of the two tests was accepted, which was .042.

Now let us see what Mr. Hamilton said about the United States separator, before he got to that point he "was afraid it would be said they were bought up." His statement was as follows:

FABIUS, N. Y., Nov. 22, 1897.

The No. 1 U. S. Separator we bought of you is doing fully as good work as it did last year. We have made several tests of the skim milk showing only 0.04 of butter fat. The longer we use it the better we like it.

W. L. HAMILTON,
Sec'y Fabius Creamery.

Bear in mind that this was not the latest United States Separator and yet THERE WAS ONLY .04 OF ONE PER CENT OF BUTTER FAT LEFT IN THE SKIMMED MILK, WHICH IS .002 LESS THAN THE TESTS OF THE BEST TWO DE LAVALS IN THE SIX DAYS TESTS.

Now suppose the De Laval separated perfectly, leaving no butter fat whatever in the skimmed milk (but it did not. In some tests it left .08 to .14), it could not possibly save more than this .04, for this was all there was to save. Then this .04 of one per cent of the year's milk, 9,723,369 lbs., amounts to 3,889 lbs. butter fat, which at 18 cents per lb. amounts to $700.02, or but a little over half what Mr. Hamilton, the secretary, says "they are convinced" they would save by their estimates. Now, does the reader wonder that Mr. Hamilton was afraid the public would think "they were bought up" if they gave the still better records of the 30 days tests of the later improved United States?

The De Laval Company will try to squirm out of this by claiming greater churn-ability of their cream. This claim is false. All Experiment Stations agree that there is no foundation in this claim.

Again, in the private contract made with the De Laval Separator Co., the Fabius Creamery was to advertise the United States Separators in creamery and dairy papers as though they were its property, but all expenses of advertising were to be paid by the De Laval Separator Co. This agreement, however, was entered into without the knowledge of a part of the officers of the Fabius Creamery and was condemned by them when they learned of it.

Is this not conclusive that the De Laval Separator Co. and the Fabius Creamery entered into a compact to injure the United States Separators?

Will not every honest reader admit that, as the De Laval Separator Co. finds it necessary to be bolstered up by such methods, it cannot win on its merits, and that the IMPROVED UNITED STATES SEPARATOR IS THE BEST SEPARATOR?

VERMONT FARM MACHINE COMPANY,
Bellows Falls Vt.

Milk Fever and the New Treatment.

In discussing milk fever, we should remember that this disease is not a fever at all. That is, there is no elevation of temperature as in most infectious and inflammatory diseases.

This name was given before clinical thermometers were in use, and when temperature measurements of cows were impossible. A better name is parturient paresis, meaning a partial paralysis, occurring at the time of parturition.

As to the causes of milk fever, we have some definite knowledge and many guesses. It is known that this disease is almost exclusively confined to the richest milking cows in the prime of life. Too many dairymen know to their loss that milk fever usually selects the best cow in the herd. The disease is most likely to occur after the birth of the third, fourth, or fifth calf, and only when the act of parturition is normal and easy. Warm seasons or warm stables predispose to milk fever, as do high condition and stimulating and rich food. Unrelieved tension of the udder with milk before calving increases the tendency to milk fever.

The conditions opposite to the above usually protect cows from this disease. That is, milk fever is very rare indeed among cows that are poor milkers—the beef breeds are almost exempt—heifers with their first calf practically never have milk fever—and it is rare with the second calf and old cows past their prime. It does not follow difficult, painful or prolonged labor—although the exhaustion following this condition may bear a superficial resemblance to milk fever. Poor pasturage and low feeding lessens the danger from milk fever and this malady is not likely to occur in a cow that is milked up to calving, or in one that is milked regularly before calving to relieve the tension of the udder.

In an animal that is dead of milk fever, there are no striking alterations. Indeed, the alterations are so slight in many cases that if the history and symptoms are unknown it may be impossible to determine the cause of death. It may be said that there is no constant and characteristic alteration of milk fever, although it is often found that the brain is somewhat congested or oedematous, that the contents of the third stomach are dry, that some food has passed from the paunch into the throat, and that the lungs are inflamed from the passage into them of substances that were intended for the stomach.

All of the above has been known for a long time and is repeated by nearly all writers on the subject. But when attempts are made to explain these facts the writers differ greatly, and their conflicting theories prove that there is but little definite knowledge as to the real nature of milk fever. These theories need not be discussed, it is sufficient to say that this disease has been ascribed at one time or another to chilling or indigestion at parturition, to the entrance of air into the veins by way of torn vessels in the womb, to congestion of the brain from a surplus of blood after the need for blood is lessened by the expulsion of the fœtus, by clotting of blood in the vessels of the brain, etc., etc. Another theory, that had many supporters for a long time, is that this disease is a poisoning or intoxication due to the absorption of substances produced by bacterial action in the womb. This view has had more strength than any of the others, for it offers an explanation of the symptoms and lack of post mortem tissue changes, all of which resemble the conditions following some intoxications.

But none of the theories could be made to harmonize with all of the observed facts, and, as the facts could not be changed, the theories had to be dropped.

A DANISH THEORY.

Two years ago, a Danish veterinarian suggested that milk fever may be a poisoning of the animal due to the absorption from the udder of abnormal substances produced there under certain conditions. It is known that by the fermentation of certain organic substances poisonous compounds, known as ptomaines, may be produced. These sometimes develop in sausage, cheese, ice-cream, preserved meat, etc., and in such cases produce illness when eaten. Such poisonous substances are the product of bacterial action. It has been shown recently by Dr. V. A. Moore that bacteria may be found even in the deep parts of many udders. It is not impossible, therefore, that poison, producing fermentations may occur in the colostrum and that the animal may be poisoned by the absorption of this material from the udder. If we accept this as a working theory, does it explain the known facts in regard to milk fever, and does it harmonize with all of them? If injurious bacteria enter the teat they will have greater opportunities to become distributed by the prolonged manipulation, and through the wide passages of the productive udder of the rich milker than through the unmanipulated udder of the heifer or the more confined passages of the poor milker. After distribution, also, they will find more secretion upon which to feed and work in the udder of the rich milker than in that of the poor milker. If the cow is kept milked out prior to calving there will be little opportunity for any injurious substance to accumulate in harmful quantity. The conditions that tend to prevent milk fever are the conditions that tend to repress the activity of the udder, as bleeding, purging and low feeding. That high condition, without an active udder does not predispose to milk fever is shown by the fact that this disease is so rare among Hereford, Galloway and Angus cattle, although the cows of these breeds are usually in higher condition than Jerseys or Guernseys when they calve. It appears, therefore, that there is some force in this new theory, and it remains to determine whether a plan of treatment based upon it will give better results than have heretofore been obtained. Milk fever has always been looked upon as a very fatal disease, and in different places and differen seasons the mortality has ranged from fifty to ninety per cent.

If milk fever is produced by the absorption of a poison developed in the udder, the injurious material in the udder should be removed or neutralized as soon as possible. Frequent milking—every hour or so—has for years been looked upon as a very important part of the treatment in all of these cases. But the new treatment goes farther than this, it provides for washing out the udder. Pure water and many solutions have been experimented with, and it has been found that a one per cent solution of iodide or potash has given the best results. About one-half pint of this solution is injected into each teat, and distributed by rubbing and manipulation through each quarter of the udder. The solution is allowed to remain for fifteen or twenty minutes, and is then milked out. This is repeated in four hours, if necessary. In making the injection, a milking tube is used to which a piece of thin rubber hose two feet long is attached. In the loose end of this hose, a small funnel is inserted; this is held above the udder and the solution is poured into it and allowed to run slowly into the milk cistern and ducts.

NECESSARY PRECAUTIONS.

Most careful attention must be paid to the cleanliness of the udder and hands and the sterility of the instruments and solution. The solution must be made with freshly boiled, distilled water, and in a sterile bottle. The instruments, that is the milking tube, the rubber tubing and the funnel must be freshly boiled and kept in a perfectly clean dish until used. The udder must be washed and the teats disinfected, and the hands disinfected before the milking tube is inserted. All of these extraordinary precautions are necessary to prevent injury to the udder. If foreign matter or certain bacteria are introduced with the instruments or medicine, the udder will become inflamed and perhaps will be destroyed.

As to other treatment, it is always necessary to keep the cow propped up in an upright position with bundles of straw or bags of chaff. This keeps the blood from settling in one lung and helps to prevent death from exhaustion or pneumonia. It is also well in many cases to give stimulants, as aromatic spirits or carbonate of ammonia or alcohol. If the cow can swallow, it is well to give a purge of one pound of Glauber's salts dissolved in one quart of molasses. The legs should be well rubbed and the position changed often enough to prevent cramping.

As State Veterinarian, I have asked many veterinarians to co-operate with me in try-

A HARMLESS PREPARATION OF ANNATTO HAVING HIGH COLORING POWER.

Those are the exact words used by Prof. H. W. Wiley, the National Chemist at Washington, in describing our

Thatcher's Orange Butter Color.

There is no higher authority. This verdict is positive and beyond caval and dispute. Thatcher's Orange Butter Color will stand the most exacting test of the new Pure Butter Color Law of New York. Other states will follow the lead of New York in passing such laws. If you begin now by using a pure and harmless color—Thatcher's—you will have nothing to fear from the action of such laws. Then, too, there is the satisfaction of knowing that you are supplying your customers with a pure and wholesome article of food—**not a coal tar color**, which has been condemned as being poisonous and unfit for use in butter.

Send for Sample of Thatcher's—The Purely Vegetable color, and full information.

ing this new treatment. Reports on more than one hundred cases show about seventy-five per cent of recoveries. Dr. Schwartzkopf has collected reports on a large series of cases treated in this country by this new method, and they show seventy-three per cent of recoveries.

In Denmark and Germany the treatment is used more than here, and the recoveries amount to eighty-three per cent, according to the last published statistics, covering several hundred cases.

Enough has been done to show that this treatment gives much better results than have ever been obtained before, and it is highly probable that the results will become better still as the new method is better understood and more extensively used. It is also possible that some improvements can be made in it. The research laboratory of the State Live Stock Sanitary Board is using a part of its resources in the further solution of this problem. LEONARD PEARSON,

State Veterinarian of Pennsylvania.

Pasteurizing Skim Milk.

ED. HOARD'S DAIRYMAN:—I see in the DAIRYMAN of Oct. 13, Mr. B of Potsdam, N. Y., wants to know if it is not possible to pasteurize the skim milk at the creamery. I am running a skimming station and all of the milk is pasteurized and the patrons do not have to wait for their milk either. The weigh platform is on one side. The milk is weighed in and the patron drives around to the opposite side and the sterilized skimmed milk is ready for him to draw. After the milk is skimmed it is elevated to a tank over head by means of a steam jet pump. In the large tank is a small round tank holding about two gallons. The milk is delivered into it; there is also another steam pipe entering it, which is full of small holes in the bottom side. I turn on enough steam to heat it nearly to the boiling point, fast as it runs from the seperator. Sometimes it does boil but it does not have any burnt taste. We can skim and pasteurize 100 pounds in three minutes and there is no waiting. I would like to take a sky view of the tank Mr. B. gets his skim milk from (that is I would want to view it from the sky.) I would not want to get any closer to it than that.

The creamery man surely does not read HOARD'S DAIRYMAN, or there would not be any milk of any kind in the skim milk tank when the first patron came. Our skim milk tank is washed just as often as our separator, and there is no bad odor about the station. But we give the DAIRYMAN all the credit. If Mr. B. will get his creamery manager to read the DAIRYMAN awhile, he will be able to get his milk on time and pasteurized too in a clean tank, unless he be like the editor of the *Jersey Bulletin*, "sot in his ways."

If you will just come to Kansas, we will give you your milk back sweet and on time. I have been thinking of trying to tell you what the DAIRYMAN has done for me but am not capable of doing it in good enough style for any one to read. J. R. C.

Burden, Kans.

The above is practically the plan illustrated and recommended in the DAIRYMAN years ago.

Wisconsin Cheese Makers' Association.

ED. HOARD'S DAIRYMAN:—In response to the call of Pres. J. A. Carswell, the Board of Directors of the Wisconsin Cheese Makers' Association met on October 13th at Madison, in the rooms of the Capital House, where extensive preparations were planned and discussed for the Eighth Annual Meeting of the organization.

In addition to other important business pertaining to the future welfare of the Association, it was decided to hold the next meeting in the city of Madison on the 7th, 8th and 9th days of February, 1900.

The very best dairy talent obtainable in Canada and the States will be secured, and no time or expense will be spared in making this coming meeting the very best in the history of the association. The preparations will be vigorously pushed from now up to the date of the meeting, and will include papers and addresses along all lines of cheese making.

The Board guarantees the cheesemakers' of Wisconsin a most excellent program and splendid premium list. U. S. BAER.

Secy. Wisconsin Cheese Makers' Assn.

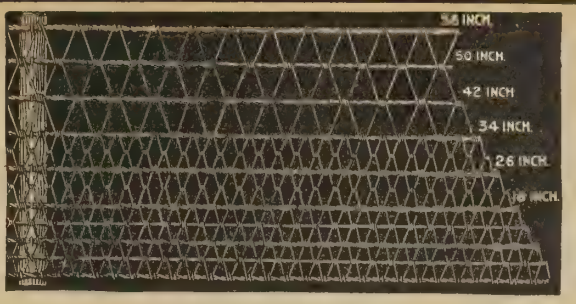
We all covet strength and admire it. We look at the marvelous muscular development of a Sandow with envy and straightway resolve to buy a pair of dumb bells and get strong, as if the secret of strength lay in muscles.



Strength begins in the stomach. It begins there because there the strength elements are manufactured, and from there they are distributed to blood, bone, brain, muscle and nerve. If you want to begin to be strong, start with the stomach. Put the digestive and nutritive organs and blood making glands in perfect working order. That is the foundation of strength. Exercise puts on the superstructure of development.

To establish the stomach and the digestive and nutritive functions in perfect health, there is no medicine so sure and so satisfactory as Dr. Pierce's Golden Medical Discovery. It strengthens the stomach, enriches the blood, nourishes the nerves, and regulates the functions of every vital organ of the body.

"About twelve years ago I was suddenly taken with a pain in the pit of the stomach which was so violent I could not walk straight," writes O. S. Copenhaver, Esq., of Mount Union, Huntingdon Co., Pa., (Box 222). "It would grow more severe until it caused waterbrash and vomiting of a slimy yellow water. I consulted a physician and he told me I had a form of dyspepsia and treated me for about six months with but little benefit. I still kept getting so weak I could scarcely walk. I then tried another physician and he told me my liver was out of order and that I had indigestion. He gave me a treatment and I got some better but only for a short time. I then took to using several widely advertised patent medicines, but received no more than temporary relief while using. I then tried Dr. Pierce's medicines, using his 'Golden Medical Discovery,' 'Favorite Prescription' and the 'Pleasant Pellets,' and in two months' time I was feeling better than I had for years before. I can truthfully say Dr. Pierce's medicines did me more good than any I had ever taken."

Dr. Pierce's Common Sense Medical Adviser, 1008-pages, fully illustrated, is sent free on receipt of 21 one-cent stamps (cost of mailing only) for paper edition, or 31 stamps for edition bound in cloth. Dr. R. V. Pierce, Buffalo, N. Y.

THE ELWOOD STANDARD

WOVEN WIRE FENCE

is only one of the ten styles we make. We call it our standard because it is designed to meet nearly every requirement of the fence user. Made in **six heights**, as you see it in the illustration, for cattle, horses, hogs, pigs and general farm fencing, this is by all means the Standard Fence, outselling every other fence on the market. **And it's cheap, too.** If you can't find the Ellwood at your dealer's write us for catalogue.

Winter and Spring Wheat Bran.

[Press Bulletin.]

The Pennsylvania Experiment Station has recently completed some interesting investigations into the relative value of winter wheat and spring wheat bran. The samples examined represented the various brands offered for sale in his locality.

Based on older analyses, the general opinion has been that there is no material difference in the composition of winter and spring wheat bran. The Station's analyses, however, as well as later analyses in other states, show that, on the average, spring wheat bran is about one per cent richer in protein than winter wheat bran, while experiments at the Massachusetts Station indicate that the protein of spring wheat bran is also more digestible than that of winter wheat bran. So far, then, as bran serves for the purpose of supplying protein to balance up a ration, the spring wheat bran appears to be preferable to the winter wheat bran, notwithstanding that the latter usually commands a higher price in the market.

The composition of the different samples of bran was found to vary considerably, and it was also found that in Maine and Massachusetts, where an official feeding stuffs control is maintained, the variation was somewhat less and the average grade of the product, somewhat higher than in Pennsylvania.

The results of these investigations will shortly be published in bulletin form.

The Value of Sorghum as a Feed.

[By A. HALL, read before Farmers' Institute, Speed, Kans., September 18, 1899.]

The need of the hour is the greatest amount of production at the least expense, and the great question for every producer to solve is, "Will this thing or that thing pay better?"

The Navajo Indian weaves a blanket which requires his labor and skill for one year, and yet he has an unspeakable pride when he gets $10 for his labor. But in higher civilization it is estimated that one must have at least 50 cents per day if he feeds and clothes himself and lays by a small amount for old age. Then if we measure the value of this Navajo blanket by a higher civilization it is worth just $156. Our fathers considered they had reached the goal when a hand had cultivated twenty-five acres of corn and fifty bushels per acre had been obtained, or a total of 1,250 bushels. Nevertheless they so directed our observations and pointed to a higher economy that we are enabled to somewhat grasp the situation as it is presented, so today we consider seventy acres per hand and thirty bushels per acre, or a total of 2,100 bushels, of more value than that which our fathers produced.

Then it is the economy of production that gives value to all products. To illustrate, if one ton of sorghum is worth four tons of prairie hay, and yet if those four tons of prairie hay can be produced at a less expense than one ton of sorghum then it would be economy to produce the four tons of prairie hay. What I have to say of sorghum as a feed will be along this line. I shall not speak of sorghum as a substitute for grain but as an aid, as I have never learned to prepare stock for market without the use of what I consider a stronger feed than sorghum.

I will presume that every farmer has his mode, or manner, of raising sorghum. I prefer sowing it with a drill, where that implement can be had, otherwise broadcast. As a feed for stock hogs in spring and summer I have never found anything to equal it. Where hogs have to be kept in pens, as most farmers in this community are compelled to keep their hogs, they can be grown faster and cheaper on sorghum than any other feed we can produce; but for the feed to do the most good it must be prepared fresh—that is, it must be cut or pulled at each feed, and I prefer pulling it as the hogs will eat every root and often will eat roots first. To pull the sorghum will not take as long as it may seem at first thought. Where hogs are fed three times a day any person can pull enough sorghum in thirty minutes to feed forty hogs.

For hog feed, the seed can be sown the first of April, or sooner if the ground can be worked, and by the 15th of May you can cease feeding all grain to stock hogs and go in on sorghum.

But grand as sorghum is as a hog feed, I have always found my best results when it is used as hay for horses and cattle. I consider one ton of sorghum hay worth four tons of prairie hay as a feed, and it can be produced at one-tenth the cost when everything is considered. It will yield from four to eight tons per acre, and I have heard men, whose truthfulness and ability to judge accurately I have no reason to doubt, say they have raised twelve tons per acre. For hay, it can be sown any time from April 10 to June 20; then let it grow until headed out and the seed well ripened.

Now let us note its great advantages over any other hay. You can cut your sorghum hay in August and if you are crowded in work you can put it up in December and the stock will eat it just the same and your results will be as satisfactory as though it was put up sooner. But I advise you to put in the stack in four weeks after cutting, but no sooner.

Let us make a little compairison of yield per acre with that of prairie hay. Sorghum will yield from four to eight tons per acre. Prairie hay will not exceed one ton per acre, and I hold that one ton of sorghum hay is worth, as a feed, four tons of prairie hay—that is, it will keep the same amount of stock in as good condition as will four tons of prairie hay. In this respect, when we consider its cheapness in production, its enormous yield per acre, the easy manner in which it is cured, and the satisfactory results from feeding it, we must conclude that we have nothing to equal it in value as a feed.

Before coming to Kansas I had been accustomed to seeing either sheaf oats, red clover, or timothy used as a hay, but I consider sorghum superior to any of those. With the advancing price of land, with the great demand for valuable feed, with the sharp competition which is continually being presented, it behooves every farmer to try for the best results at the least expense.

Two eminent statisticians have been figuring the shortness of time at which this nation will cease to export grain. One has fixed the date at fifty years and the other at thirty years. Just how correct either one is remains to be seen, but I venture the assertion that no thrifty farmer in this community can afford to keep one acre of ground for the purpose of producing one ton of prairie hay ten years hence.

In closing this paper I will say that perhaps we have those with us who may be able, with the aid of science, to prove the fallacy of some of these assertions. But we invite all friendly criticism, holding that he who corrects an error is a benefactor.—*Kansas Farmer.*

The Youth's Companion

Issued Every Week—$1.75 a Year.

FREE—
Every Week to Jan. 1, 1900 ...

THE YOUTH'S COMPANION, BOSTON, MASS.

VETERINARY.

Queries in this department answered by WM. HORNE, M. D. V. S., Janesville, Wis.

COW PHYSIC—Three-fourths to 1¼ pounds Epsom Salts (according to age and size of animals) and two ounces of best ground ginger. Pour over this three pints of boiling water. When at 105° F., give gradually as one dose.

FAILURE TO BREED.

I have a heifer about twenty-one months old, that was bred the first time when about one year old. She came in heat about three months later, and was again served by the same bull. This bull is two years old, and is a sure bull. Since then she has been in heat two or three times, and was served each time. P. T.

Marinette, Wis.

ANSWER.

Repeated serving is always ruinous. In all such cases, you need a medicine to stop coming in heat for several seasons. Such medicines are advertised in the DAIRYMAN, and they, being special, are the safest and cheapest for your purpose. The formulas for such uterine and ovarian conditions are compounded from drugs not fit for a layman to meddle with, and no simple form of medication is worth anything at all.

SWEENEY.

Is there any cure for sweeney in horses? I have a six-year-old which got sweeneyed last spring, by plowing him, and seems I can not get any cure for same. H. H .F.

Cincinnati, Ohio.

ANSWER.

Atrophy of the muscles of the shoulder is common to the horse of the hard driver. All sorts of butchery and fool-hardy methods are recommended by the different know-alls. Rub hard twice a day with alcohol and fish oil, half and half. About every third day rub in home-made lard and alcohol as a change in feeding the muscles of the shrunken shoulder.

POISONOUS PLANTS IN HAY.

Last spring there was a good deal of sickness among calves here; they lost appetite and their ears drooped forward, and the hair got rough; passage very offensive, often being of a whitish color. Those we opened had a place in the wind pipe that seemed much inflamed. The disease appears to be coming again this fall. Some sucking calves were affected and in nearly every case the calf died. J. D. McL.

Winfred, S. D.

ANSWER.

I have lately been studying the poisonous plants found in the pastures, in the hay, on the corn stalks, etc., etc., and find from professional chemist's catalogue of plants, that there are from fifty to seventy poisonous plants to be found in our pastures, hay, corn stalks, etc., etc, and that these cause many deaths by poisoning amongst our domestic animals yearly, and also cause death in the human family, poison rye grass, poison Indian corn grass, common ergot, sleepy grass, all the buttercups, etc., etc. One of the most deadly vegetable poisons is our much valued lilly of the valley. To chew one single stem of the fragrant flower is dangerous.

DEATH FROM EATING COW PEAS.

Mr. E. Kaiser, of Freestate, Mo., asks about the effect of green cow peas on cattle. After allowing his cattle to feed in a field of green cow peas for half an hour, five head out of sixteen died in a short time—three milch cows and two yearling steers. The cows began to shiver and became stiff; were not bloated at first, but slightly towards end of sickness.

The letter was referred to Dr. Horne who answers as follows:

ANSWER.

Yes, if given too liberally, but the cow pea, so far as I know, is not specially a cause of hoven—bloat. I am quite sure your cows were poisoned by some poisonous plant and not killed by bloating; there are many more deadly poisonous weeds now than there used to be; quite a good many of them are hidden to the ordinary observer. Smut seems to be a prominent source of poisoning to our domestic animals.

FAILURE TO SERVE.

I have a pedigreed Ayrshire bull, three years old last July. Kept on tether during the day, stabled at night and moderately worked on a dung sled. Serves one or two cows a week. He gets about six pounds hay in the stable and keeps in such good order as to be inclined to be fat. Lately he is beginning to lose all ambition for service. With a cow in prime season, it will take him an hour to make up his mind often, making four or five futile attempts. Can you suggest a remedy? D. F. B.

Whonnock, B. C.

ANSWER.

I kept Durham, Jersey, and other breeds of bulls for public service for twenty-five years, and had, of course, lots of experience. I observed all sorts of freaks; many like yours, only mine never worked. Let him rest from service and hauling the sled. Give him nux vomica in half dram doses, and one dram of blue flag in one ounce of old whiskey and three ounces of water; one dose a day for three doses; then rest four days; then give one dose every four days for just three doses only.

POOR APPETITE.

I have an Ayrshire-Jersey calf, now in his sixth month, that will not eat. He, with five others of about the same age have been in an old orchard all summer and have been fed grain. In September my man, instead of feeding the calves some mixed hay, to help the pasture out, gave them some green cut corn ensilage, about two bushels daily for six calves. When I found the calves getting thin in flesh I inquired as to their feed, and at once stopped the ensilage. (This ensilage was cut fresh from the stock every morning.) Then this calf refused to eat any other food. I try to induce him to eat brown middlings and whole oats. Sometimes I offer him white middlings, wheat bran and whole oats. He will eat but a mouthful or two of either, and will eat only a wisp of hay. I gave him a physic of castor oil. He is not scoured, simply has no appetite and is very poor in flesh. F. SIMPSON.

Ridgeway, Pa.

ANSWER.

No kind of oil has a place in the stomach of the bovine family, only as an injection. Sulphate of magnesia is the true cow physic always. Give the little fellow one scruple of nux vomica, two drams of fluid extract of golden seal in one ounce of old whiskey and two ounces of cold water; one dose each morning for two days, rest three days, then give one more dose. In five days give the last dose.

SWELLING OF SHEATH—SMUT POISONING.

I have two cases of sickness in my herd of full-blooded Holstein cattle.

No. 1. A bull between two and one-half and three years old, having been used with mild service upon the cows, that is to say, not oftener than twice a week, was put into a pasture by himself and fed wheat and oat hay mixed, with free access to pure, fresh water directly from the spring. He did not seem in any way out of order the day before, but the next morning was very much swollen about the navel, the swelling extending well along his sheath. He appeared stiff in his hind legs. I had the swollen parts bathed in hot water, and gave him a pound of Epsom salts with a teaspoonful of ginger dissolved in hot water, three consecutive mornings. He now seems to be quite well, as far as his actions indicate, eats the usual amount of hay and chews his cud regularly, but the swelling of his sheath has not entirely subsided.

No. 2. A cow six years old dropped her last calf last January; since then has milked steadily, good appetite, has been fed a mixture of wheat, bran and middlings, one part of middlings to three of bran, and all the wheat and oat hay mixed she would clean up, with free access to pure spring water. She was bred to the bull the first of September, not having come into season until that time since dropping her calf in January. About two weeks ago she refused to eat, her flow of milk rapidly diminishing; seemed very stiff in all her muscles, and would creep along rather than walk, and seemed to quiver in the muscles of her fore and hind quarters. A few days later her hind quarters began swelling so that she was puffed from her hips to hind hoofs. Also swollen between the front legs to quite a little distance under her belly. I gave her a Glauber salts drench morning and night for two days, and blistered each hind quarter with mercurial blister, feeding her as much as she would care to eat, of green corn stalks and leaves, twice a day. She steadily refuses to eat hay, but seems now to be doing very much better.

San Francisco, Cal. R. M. H.

ANSWER.

No. 1. Needs and must have a personal examination to find out the difficulty. He may have been stung. He may have some foreign body up in the sheath, or he may be foul in the sheath, etc.

No. 2. The mercurial blister was malpractice. Your symptoms indicate smut poisoning, clearly, or some other form of poisoning. Give repeated full doses of sulphate of magnesia, not Glauber salts, i. e., sulphate of soda. This of course to be given with intelligence. If too much reduced in flesh, purge more lightly. Still, purging is the best and simplest method.

Rub in hard: Sulfuric ether, two ounces; oil of cedar, two ounces; camphorated spirits, strong, six ounces; fish oil, six ounces. Keep well corked and out of the sun, and shake each time before using. Keep in shade. Rub twice a day.

Solfiline

of all things is the best with which to oil shoes. One treatment makes sole and upper absolutely waterproof. Can't have wet or damp feet with

IT CAN'T BE DONE

No One Can Remain Well, No Chronic Disease Can Be Cured Unless the Stomach is First Made Strong and Vigorous.

This is plain because every organ in the body depends on the stomach for its nourishment. Nerve, bone, sinew, blood are made from the food which the stomach converts to our use.

How useless to treat disease with this, that and the other remedy and neglect the most important of all, the stomach.

The earliest symptoms of indigestion are sour risings, bad taste in the mouth, gas in stomach and bowels, palpitation, all gone feeling, faintness, headac es, constipation; later comes loss of flesh, consumption, liver and heart troubles, kidney diseases, nervous prostration, all of which are the indirect results of poor nutrition.

Any person suffering from indigestion should make it a practice to take after each meal one of Stuart's Dyspepsia Tablets, allowing it to dissolve in the mouth and thus mingle with the saliva and enter the stomach in the most natural way. These Tablets are highly recommended by Dr. Jennison because they are composed of the natural digestive acids and fruit essences which assist the stomach in digesting all wholesome food before it has time to ferment and sour.

Stuart' Dyspepsia Tablets are sold by druggists, full sized packages at 50 cents. They are also excellent for invalids and children. A book on stomach diseases and thousands of testimonials of genuine cures sent free by addressing F. A. Stuart Co., Marshall, Mich.

On Mixing Feeds.

Perhaps instead of talking so much about balanced rations and nutritive ratios, it might be well to talk a little about mixing feeds. First, a few facts: It is a fact that you yourself, while fond of bread and fond of butter, like them a good deal better together than you do separate. You could live on bread without butter if you had to, you could live for a little while on butter without bread, but you can live better by spreading the butter on the bread. You are fond of beans and you could eat them without pork, you are fond of pork and could eat it without beans, but long experience has taught you and your grandmother that pork and beans together are better than either pork or beans separate. You are fond of potatoes; you are also fond of beef. You could make a meal on brown potatoes without roast beef, or you could make a meal on roast beef without brown potatoes, but your grandmother taught you long ago that roast beef and brown potatoes are a very good mix for a substantial dinner. We might state facts like this much more fully, but the above will convince you that you like your food mixed.

Observation has taught you long ago that oats are good for pigs, and so is corn, but if you have kept you eyes open and notice closely you have observed that pigs make better gains on oats and corn mixed than they do on either separate. On the same line we might give you a few similar facts from the stock yard. With potatoes at ten cents per bushel, the digestible nutrients or food will cost you ninety cents per hundred pounds. With corn at thirty-five cents the digestible nutrients will cost you seventy-eight cents per hundred pounds. With middlings at $14.00 per ton, the digestible nutrients, or that part which the animal actually utilizes, will cost you ninety-seven cents per hundred pounds, and with skim milk at ten cents per hundred pounds, the digestible nutrients will cost you $1.12 per hundred pounds.

This makes potatoes with corn at thirty-five cents worth for feeding purposes between eight cents and nine cents per bushel as compared with corn, and it makes one hundred pounds of corn worth about nine times as much as one hundred pounds of skim milk. Now let us try a little mixing. It has been found by the experiment stations, in actual feeding, that six hundred pounds of milk fed alone will make about as much gain as one hundred pounds of corn, but that if you mix the milk and corn in the ratio of three or four pounds of milk to one of corn, that between three hundred and four hundred pounds of skim milk will equal one hundred pounds of corn meal. Potatoes fed alone to hogs are worth very little unless they are boiled, but mix them with middlings or shorts or oil meal and note the high appreciation that the hog has for that kind of a mixture. His appreciation is scientific as well as practical. He believes in mixed feeds. If you offer him a mixture of corn and potatoes, he might probably turn up his nose, that is, if he had been fed like a millionaire. He does not know anything about science or balanced rations, but he distinguishes very quickly between mixes and mixes. He will take his corn with skim milk or buttermilk, if you please; he will take his potatoes with middlings, or he will take corn with middlings. While he will take middlings and skim milk, his internal consciousness would indicate after a little while that the mix was not quite right. The little pig might think differently because he is different.

Experience has taught the farmer that clover hay with corn fodder or timothy or straw or corn is a most excellent mixture, that clover and corn will do better together than separately, and that corn fodder gains in value very rapidly by being fed interchangeably with clover hay. In other words, that you get not only the value of each, but you get an additional value as a result of the mix.

But after all, this is only the old doctrine of balanced rations and nutritive ratios stated in a different way. The skim milk has a nutritive ratio of one to two, and potatoes one to 11.5; that is, one of flesh formers to the amount stated of fuel or heat makers. What the growing pig, calf or lamb requires is about one to five, or about the ratio of oats or middlings; hence, the importance of mixing. The reason why you like bread and butter mixed is because butter is almost entirely a pure heat maker; the bread, especially brown bread, is largely muscle making. You want them mixed, and when the weather is very cold and the demand for heat greater, you would not object to some side meat with it.

The doctrine of balanced rations is founded on nature's laws. You can not avoid them except at your own loss. Mixing feeds intelligently is simply balancing rations, and you will mix with larger intelligence and greater profit if you will take time to study nutritive ratios. It is all right to call it mixing feeds, and the science of mixing feeds, but it is just as well to master that word nutritive ratio and get down to scientific principles. It is not after all any bigger or harder word than telegraphy or telephone, or any other of the new words that science is continually forcing upon us.—*Wallace's Farmer.*

Paralyzed Pigs.

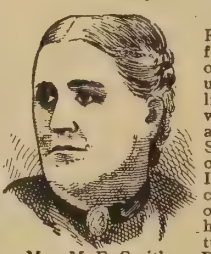
Every year we receive many inquires from subscribers wishing to know what is the matter with shotes and brood sows that are paralyzed in their hind quarters. They go down, their general health does not seem to be greatly affected, and we have known brood sows affected in this way when their pigs were a few weeks old that nursed their pigs through without any apparent loss. In our boyhood days the cause was supposed to be kidney worms, and they were dosed with corn that had been boiled in lye, but without any marked effect. That there is such a thing as kidney worm every butcher is well aware who has found the worm actually in the kidney. We believe, however, that while occasional instances of this may occur, the breaking down of pigs in their hind quarters is due in general not to the kidney worm, but to improper feeding. In fact improper feeding is the cause of many of the ailments of pigs, and often when not suspected. When a brood sow has been fed on a corn diet and been compelled to draw on her own system for the flesh and bone forming materials and then meet the wants of a litter of pigs that require a flesh forming diet, it is easy to understand why she should break down. When pigs have been fed on all corn diet, having access neither to oats, pasture, lime, nor ashes, it is not strange that when they get to be 100 or 150 pounds weight they break down, for the same reason that hogs fattened in this way to 200 or 300 pounds are often found too weak in the bone to stand the hauling of a few miles to market, and break down.

How is this to be remedied? First, by feeding brood sows oats and clover hay as well as corn; second, by giving the pigs skim milk, clover pasture, and a partial diet of oats, shorts or bran. The latter cannot be used in large quantities, because it is too bulky, but oats, shorts, and clover hay can be used. All hogs should have before them at all times a mixture of salt and ashes and should have access to the earth where they can root for what they want. As frequently stated, we do not believe in fighting with the Creator of the hog in putting rings in noses that were intended for rooting. If they root up the pastures, let them root. There is something wrong with your pasture. The hogs are helping, rather than hindering.

The above is not merely the dictum of the editor of this paper. The subject has been throughly tested at the Wisconsin Experiment Station, and it has been proved beyond question that a sole diet of corn, such as a majority of farmers give their hogs, will not produce strong boned hogs, and it is the weak boned hogs or brood sows that have been compelled to make bricks without straw that break down. Now is the time to avoid the difficulty for the future. Give the brood sow the proper material with which to manufacture. A pig factory can not produce healthy pigs without the right kinds of material, and this must include bone making material, in which corn is deficient.—*Wallaces' Farmer.*

Oleo.

December 10, 1896, Joseph Wilkins and Howard Butler were apprehended in Philadelphia, while in the act of removing stamps from boxes containing oleo. Wilkins was an extensive dealer in oleo at Washington, D. C., and Butler a clerk in his employ. It was stated that the dealer had previously violated the law on numerous occasions, being leniently dealt with by the authorities. This time, however, he was sentenced to six months' imprisonment and $1,500 fine, his clerk receiving a sentence of four months imprisonment and $500 fine. This was in February, 1898. An appeal was taken, and an effort made to prove the law unconstitutional. It was not until the latter part of September that the United States Circuit Court of Appeals rendered a final decision in favor of the Government, affirming the verdict, and directing the District Court to enforce the sentences imposed. It seems hard that nearly two years' fighting should be required to secure punishment of a flagrant violation of the law, but there is satisfaction in knowing that this case will furnish a precedent in dealing with future breaches of the oleo laws.



We wonder whether the writers who urge the use of oleo as a worthy food product have ever really eaten it for any considerable period. The writer lived for nearly two years with a co-operative colony in a southern state. The native butter was scarce, and of miserable quality, our dairy was in an embryonic state, and from motives of economy it was not deemed practicable to buy good northern butter. So we tried to content ourselves with oleo as a fat ration. Scarcely one individual out of three hundred ever professed to like it, and many cases of sickness, treated by resident physicians, seemed to be directly caused by eating the oleo. The use of refined cotton seed oil in most culinary operations was a decided relief, and was followed by a general improvement.

We bought the oleo directly from several of the great packing corporations composing the "beef trust," in quantity, paying a good price, and demanding the highest quality manufactured. We found it necessary to make frequent changes in the parties from whom we purchased it, as the first consignments would invariably be a close imitation of butter in texture, taste and odor, and evidently contained a high per cent of real butter. Subsequent shipments would fall off rapidly in quality, until they became too rank even for our degenerated palates, when we would try another member of the same chain of factories. This, we have heard since, is a regular dodge to secure new customers, while farming the older ones for higher profits. Now, there is no fault to be found with the use of intestinal fats when openly sold and recommended, if one become so depraved in his tastes as to relish such mixtures, but to claim that oleo, as now put on the market, is a worthy substitute for meat and butter, is an outrage on common experience.—*Rural New Yorker.*

Cured Her Rupture

Happy Restoration From a Dangerous Malady.

The Rice Method is a Wonderful and Certain Cure.

Mrs. M. E. Smith.

Mrs. M. E. Smith of Rockingham, Vt., has found in the Rice plan of curing rupture a measure of freedom and relief such as only those who suffer can realize and appreciate. Mrs. Smith says:—"One of our best doctors told me I could not possibly be cured as I was 60 years old, weigh 300 pounds and had a very bad navel rupture. However I ordered Dr. Rice's method and ever since then I have experienced relief and comfort. I know Dr Rice can cure any kind of rupture and may God bless him in his noble work is my sincere prayer."

Upon application to Dr. Rice, he will send you free a book that fully explains how he cures rupture. If you know of another person ruptured send and get a book for him. Such an act of kindness will be remembered all the rest of his life. Write today without fail. Address Dr. W. S. Rice, 353 R. Main St., Adams, N. Y. The book is mailed free to all who send name and address.

A New Book for Stockmen—Proceedings of Guernsey Breeders Ass'n.—1884-'99. It is of value to all breeders of dairy cattle; gives practical experience of many prominent men on breeding and feeding problems, treatment of diseases, etc.; numerous valuable essays on special topics. $1 post paid. W. B. HARVEY, Sec'y, West Grove, Pa.

The NEW Smalley

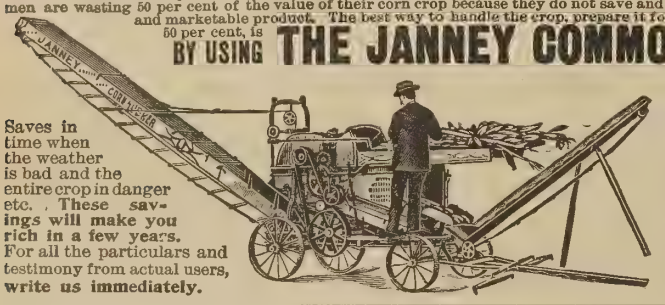
The Most Up-to-date Silo Cutter on Earth.

SMALLEY CUTTERS For 1899

Patented 1899.

are more complete than ever before. They will be furnished, if desired, with Patent Automatic Self-Feed, **increasing capacity greatly and diminishing labor of feeding nearly ONE HALF. Four sizes, Nos. 16, 18, 20 and 26.**

If your dealer don't handle them, write for 99 Catalogue and get **SPECIAL Introduction PRICES on the SMALLEY LINE COMPLETE.**



"YANKEE SILO SENSE"—our latest Silo booklet, ex-Gov. Hoard's Latest Views—mailed free to any one naming this paper.

SMALLEY MFG. COMPANY, Sole Makers, MANITOWOC, WIS.

Increase the Balance at Your Bank.

You can do this in a very short time with the profits of your corn crop if you will only handle it properly. Most men are wasting 50 per cent of the value of their corn crop because they do not save and work it into a feedable and marketable product. The best way to handle the crop, prepare it for feeding and save that 50 per cent, is

BY USING THE JANNEY COMMON SENSE Corn Husker and Fodder Shredder

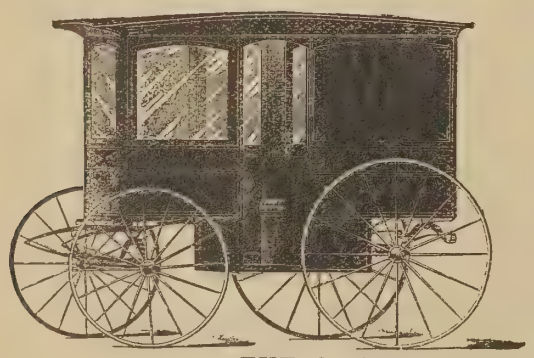
Saves in time when the weather is bad and the entire crop in danger etc. These savings will make you rich in a few years. For all the particulars and testimony from actual users, write us immediately.

It saves first by husking all the corn clean—saves in expensive hand labor; saves by shredding the fodder into "corn hay," at the same time making a superior hay, enabling the farmer to sell all his meadow hay.

JANNEY MFG. CO., Box 29, Ottumwa, Ia.

Experience Counts

The great satisfaction our **French Buhr Stone Feed and Meal Mills** have given during the last 48 years is proof that our experience has been conscientiously applied. You will save money and make money by buying one of our



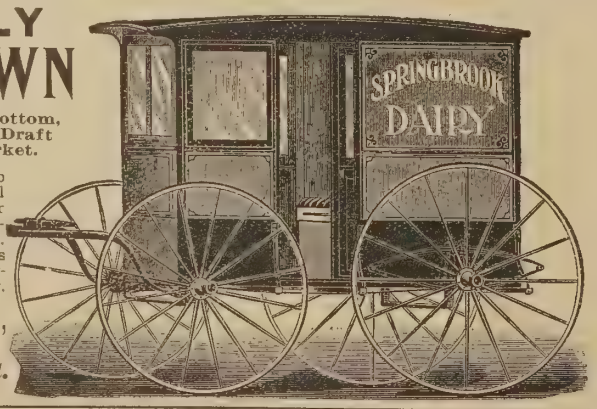
BUHR STONE MILLS. Look into it. Send for Book on Mills.

NORDYKE & MARMON CO., Flour Mill Builders, (Estab. 1851.) 25 Day St., Indianapolis, Ind.

A Perfect Milk Wagon

On a Perfect . . . Short Turning Gear

WE make the only drop center wagon that has a self-balancing, short turning gear. All parts are wrought iron forgings. It is so plain and simple that it can't get out of order and if any part should break, any country blacksmith can easily repair it. All other wagons of this kind have complicated gears, and mostly made of cast iron.



Write us for our Catalogue, which fully illustrates and describes this wagon and 10 other styles.

THE O. ARMLEDER CO., Cincinnati, Ohio.

THE ONLY LOW-DOWN

Short Turn, Straight Bottom, Short Coupled, Light Draft Wagon on the Market.

20 INCHES from ground to bottom of body. Will turn as short as any cut under reach wagon. Strong construction, nicely finished. Send for Catalogue, prices and terms. Wagons for carrying Bottled Milk a specialty.

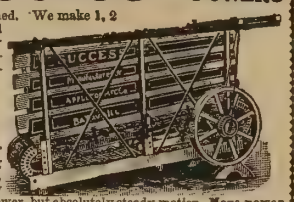
CRUSH ear corn (with or without shucks) and **GRIND** any kind of small grain **at same time,** mixing in any proportion desired. Conical Shape Grinders.

Lightest Running

Handy to operate. 7 Sizes—2 to 25 h.p. One size for windwheel use. (Also Make SWEEP FEED GRINDERS)

N. P. D. Bowsher Co., So. Bend, Ind.



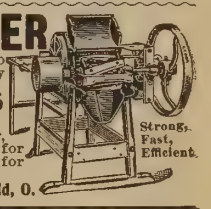
"Appleton goods take the lead, and your steel link tread, all told, has no rival."—MANLEY BROS. & STONE, Harvard, Ill.

Hundreds of Similar Testimonials prove that our

"SUCCESS" TREAD POWERS

are properly named. We make 1, 2 and 3 horse tread powers, smooth or level lags as desired, down or mounted. The

ONE-HORSE "SUCCESS"



is the **best power** made for driving cream separators, and all machinery requiring light power, but absolutely steady motion. **More power** can be obtained from the **"SUCCESS" Tread Powers** size for size than any others because they run light, are roomy and strong enough for largest horses, best governed, etc. More about them and our **sweep powers, shellers, fodder and ensilage cutters or shredders, huskers, grinders, wood saws, wind mills, steel tanks, etc.,** in our 160 page illustrated catalogue. **FREE.**

APPLETON MFG. CO., 35 Fargo St., BATAVIA, ILL.

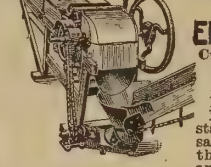
CORN FODDER

is equal in feeding value to the best hay when prepared by

THE ROSS ENSILAGE MACHINERY.

Strong, Fast, Efficient.

Cuts ensilage, corn fodder, hay, &c., for feed, and straw for **baling and bedding.** Send for free catalogue No. 7



The E. W. Ross Co., Springfield, O.

ELECTRIC FEED MILL

We have put out this mill to meet the demand of the patrons of the famous Electric Goods for a good mill at a fair price. It is a direct grinder and absorbs or wastes no power in useless and expensive gearings. Cuts, crushes and grinds ear corn, and all small grains single or mixed. Adjustable—grinds coarse or fine. Prices low. Circulars and prices free. ELECTRIC WHEEL CO., Box 180, Quincy, Ill.

"OHIO" SELF FEED ENSILAGE CUTTER

Cuts 33⅓ % more than regular machine.

Saves 75% in time.

Positively feeds itself. No pushing to get feed started, and feeds evenly saving power. New wide throat—wide as knives are long. New large hood—gives increased space for cut feed, avoids re-cutting, binding, choking, &c. The cut shows

NEW METAL STRIP SWIVEL CARRIER.

Has 2 inch steel strips—carries more feed and easier. Works at any angle—any length. Without extra section at bottom. 1899 catalogue **FREE. Prof. Woll's "A Book on Silage" 10c.**

THE SILVER M'F'G CO., Salem, Ohio.

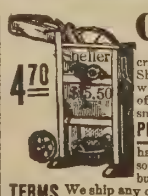
THE NEW BOOK Feeds and Feeding

By Prof. W. A. HENRY, Wisconsin Experiment Station.

This book should be in the hands of every stock feeder in the country. Every reader of HOARD'S DAIRYMAN ought to have it. It is a large, well bound book, nicely printed, over six hundred and fifty pages. Price $2.00

Four Yearly Subscribers at $1.00 Each ($4) Will Secure It as a Premium.

Four Yearly Subscribers at $1.00 Each ($4) Will Secure It as a Premium.



Of This Book Hon. JAMES WILSON, Secretary of Agriculture, Washington writes as follows:

"Prof. W. A. Henry, Dean of the Agricultural Department of the University of Wisconsin, has recently given to the American student and the American farmer a work on feeds and feeding. Singularly enough, up to this time we have had nothing along this line sufficiently comprehensive from both the scientific and practical standpoints. We have had very able works from both, but Prof. Henry is the first to combine science with practice, and give us a work that will be of value alike to the instructor in the Agricultural College, to the student who is seeking the principles underlying feeding, and to the practical farmer who feeds.

This publication will take its place immediately in the college library, and ultimately in the private library of every farmer in the land. When the instructor, student or practical farmer inquires where there is a work thoroughly exhaustive of this subject, he can now be referred to Prof. Henry's book.

Sent as above, or will be forwarded, carriage paid, on receipt of price, $2.00.

CORN SHELLERS

This 1-hole sheller has feed table, fan, crank and pulley. Can be run by hand or power. Shells 15 to 25 bu. an hr. Is 43 in. high, 20 in. wide, 51 in. long; heavy balance wheel. Made of the best material, nicely painted. Shells the smallest and largest corn equally well.

PRICE Complete **$5.50;** with crank only for hand use **$4.70.** 2-hole sheller for hand and power **$10.50.** Self-feed sheller, something new, great improvement, shells 500 bu. a day, price low. **We have no agents.**

TERMS We ship any of our shellers **on trial;** if they don't shell clean and are not perfect in every way return at our expense.

Are You an Expansionist?

Are you controlling all the available territory within your reach? If not, it will be well for you to give this subject some thought. Probably some neighboring creameryman is meditating on the question of creamery expansion right now, and should he decide to erect a fort in the shape of a **Skimming Station** in what is now neutral territory he will be pretty apt to keep you from adding to your income from that territory so long as his fort stands. He may be thinking about sending an emissary into this neutral territory for the purpose of convincing the natives that allegiance to his flag will bring them untold wealth and have them armed with **Dairy Separators** with which to hold the territory before you know what he is doing. You know "possession is nine points in the law," and while we don't know much about political expansion, we do know that

CREAMERY EXPANSION

is a legitimate and commendable policy which brings satisfactory and profitable returns to its advocates. Haven't you noticed the growing tendency on the part of successful creamerymen to control as much territory as possible? Don't you think it will pay you to reach out a little at this time when business is a trifle slack? If you decide upon a skimming station we can furnish the complete equipment at a low price and reasonable terms. If you try the hand separator plan, which is better still, we can help you to expand without expense to you. It won't do you any harm to write us when you contemplate making changes in your factory or your plan of operation, and in nine cases out of ten we can do you some good.

The Sharples Company,
28, 30 and 32 S. Canal St., - CHICAGO, ILL.
Creamery Machinery and Apparatus of All Kinds.

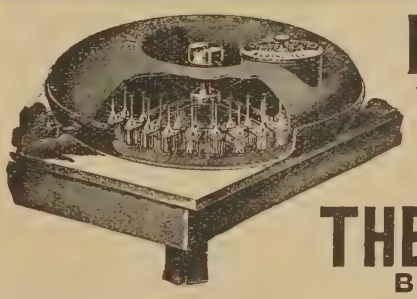
Your Full Privilege.

Most men do not live up to their full privilege in the conduct of business. This is no less true of the creameryman than of other business men. It is your privilege to employ only the best machinery and the best methods in your business. It is your privilege to make only the "top-o can," "gilt edge" "extra select creamery" butter. The kind that makes the dollars bringing reputation for yourself and your creamery. Much, very much, will depend upon the kind of separator you use in your creamery.

Sharples Tubular Separators

have almost invariably increased the yield of butter in a creamery over and above the best that was being done by separators of other manufacture. Such increase has been sufficient to pay a liberal per centage of the whole cost of the machine.

In addition to this increase in product, are the further advantages of safety; economy in oil; economy in repairs; large actual and reserve capacity; quality and churnability of the cream; smoothness and absolute freedom from ropiness and bitter froth in the cream and the resulting improved quality of the butter.



Our knowledge of the Sharples Tubular Separator in superiority of construction and working ability is such that when requested to do so, we gladly place them with the most exacting buyers, or with the users of any other make of separator in existance, and guarantee superior results in clean skimming and in the quality of the product.

Of course we should not make such a liberal and sweeping offer if it were not fully justified by past and present results. Take these things into consideration while you are reading this advertisement. Meditate them, and then write us.

No. 25 Tubular, warranted capacity, 2500 lbs. per hour.
No. 40 Tubular, warranted capacity, 4000 lbs. per hour.
No. 60 Tubular, warranted capacity, 6000 lbs. per hour.

Send for Catalogue No. 46.

Do You Know
What a Good Tester Is?

It is one that makes little noise; that has small vibration; that runs easily; that will do accurate work.

THE STANDARD
BABCOCK TESTER

will last for years. It is built for the creameryman who believes that it pays to have **high grade machinery at a reasonable price.** The Standard Tester has a solid cast iron frame and is supplied with the famous Glass Eye Speed Indicator.

IT USES THE ORDINARY BABCOCK BOTTLE.

Farrington and Woll's new book on Milk Testing with each machine. We are prepared to repair all separators, and have the most experienced men for this work. You will be interested in our free catalogue No. 61.

Address, ELGIN MANUFACTURING CO., ELGIN, ILL.

SEEDS THE ALBERT DICKINSON CO.
DEALERS IN
GRASS SEEDS, CLOVERS, FLAX SEED, LAWN GRASS, BEANS, PEAS, POP CORN, BIRD SEEDS, BUCKWHEAT, BAGS, ETC.
OFFICES, WEST TAYLOR ST., AND THE RIVER, CHICAGO.

IDEAL BOILER
OR STEAM FEED COOKER.

Many kinds of winter feed for stock can be doubled in value by being properly cooked. The method requires no watching. There is no danger of burning.

The IDEAL is a Reliable Farm Boiler for Cooking Feed, Heating Water, etc., etc.

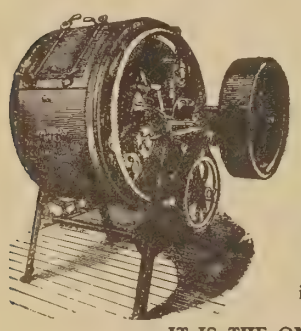
They are made from boiler iron, and have regular lapwelded boiler flues, making them durable, rigid and strong in all their parts, and will last, with ordinary care, a lifetime. They are well rivited and corked, and are capable of standing an hydraulic pressure of 150 pounds to the square inch, and are perfectly safe carrying 100 pounds pressure. Write for prices.

...A... SANITARY **Milk and Cream Ticket**

A coupon milk and cream ticket is the only milk or cream ticket that complies with all sanitary requirements, and is also the only milk ticket by which a complete check can be kept on both customer and driver. We would like to send you a sample.

We have a large up-to-date and complete line of Milk Dealers' Supplies. Everything you need. Our Ideal Milk Jars and Caps are the best on the market. Write for sample.

Our latest Milk Dealers' Price Current contains new ideas and new apparatus. May we send you one?



Alpha De Laval Separators, Ideal Turbine Testers, Disbrow Churns, Elgin Style White Ash Tubs, Ideal Corrosive Sublimate Tablets, Parchment Paper, Australian Boxes, Refrigerating Machinery, Boilers and Engines, American and Lusted Printers, Genesee Salt, Potts Pasteurizer, Etc., Etc.

Creamery Package Mfg. Co.,

We are General Agents for Hansen's and W. & R. Butter Color.

THE DAIRY "VICTOR" Churn.

This Combined Churn and Butter Worker is proving itself to be precisely what the farmers and dairymen have been seeking after. It's work is as complete as the work of the "Factory" Victor Churn, which is rapidly supplanting every other Combined Churn and Butter Worker.

IT IS THE ONLY SUCCESSFUL DAIRY COMBINED CHURN AND BUTTER WORKER ON THE MARKET.

It is easy to handle, easy to clean, perfect in its work, durable and reliable. It charms every farmer and dairyman who sees it work. Manufactured by . . .

F. B. FARGO & CO., Lake Mills, Wis.

PRINTED PARCHMENT
BUTTER WRAPPERS

Are an established factor in the CREAMERY BUSINESS to-day. Protect your special brands of butter by having your Wrappers Printed.

A. G. ELLIOT & CO. are Headquarters for these Printed Wrappers and can furnish same at prices that will interest you. **Our STANDARD** weight Butter Wrappers are acknowledged to be the best Butter Wrappers on the market to-day. A sample order will convince you.

A. G. ELLIOT & CO.,

Manufacturers, Importers and Dealers in Paper of Every Description.

Philadelphia, Pa.

YOU CAN PREVENT BLACKLEG

among your cattle by the use of Parke, Davis & Co.'s **BLACKLEG VACCINE.** Every lot is tested on cattle and found reliable before a single dose is put on the market. It will prevent **BLACKLEG** if fresh product is used, the same as vaccination prevents Smallpox in the human family. Operation simple, and easy to perform. Specify P. D. & Co.'s, and get the kind that is always reliable. For sale by all druggists. Write us for literature and full information, free on request.

PARKE, DAVIS & COMPANY, Detroit, Michigan.

The Reasons for the Superiority of the

Improved United States Separators

are well known to all who understand the principles of

CENTRIFUGAL SEPARATION.

For the enlightenment of those who do not understand these principles, those who have not studied into them and wish to understand them, we will send a catalogue explaining and illustrating separator facts and differences for the mere asking.

THE IMPROVED UNITED STATES SEPARATORS

embody principles contained in no other, which makes them **more efficient in operation,** more simple in construction and greater wearing qualities.

The rapid increase in sales is phenomenal. None can truthfully boast of such a record.

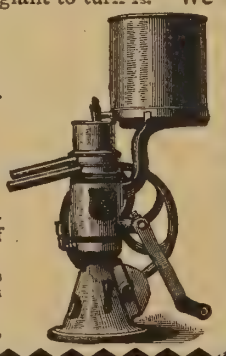
VERMONT FARM MACHINE CO., Bellows Falls, Vt.

Gluten Feed

is used by nearly all successful dairymen, and has become a necessary article for any dairyman farmer who wishes to keep pace with the successful men in his line of business.

Gluten Feed increases the flow of milk, improves the quality, keeps the cattle in the best possible condition—in fact, helps you make more money out of your dairy. This is not cheap talk. We mean business. Gluten Feed is all and more than we claim for it, and, best of all, a trial proves it. Sample of Gluten Feed, Milk Talk Pamphlet, and circular illustrating the "Value of Butter Fat in Milk," all FREE if you address

THE GLUCOSE SUGAR REFINING CO.,



DEPARTMENT H. **The Rookery, CHICAGO, ILL.**

A Hand Separator

to be profitable must not only extract every particle of butter-fat from the milk, but must run so easily that it does not require the strength of a giant to turn it. We guarantee the

Empire Cream Separators

to run 50 per cent. easier than others of equal capacity. Their record for clean skimming is unequalled. We have the most complete line of hand separators in America; also power machines.

We have not space here to tell you why the **Empire** machines excel all others, but it's all in our catalogue. Send your address if you have one cow or one thousand.

U. S. BUTTER EXTRACTOR CO., Newark, N. J.

GENESEE BUTTER SALT A flaky grain, very soluble, will not wash out (like fine salt) and brings out the best flavors in the butter.

GENESEE CHEESE SALT Trifle coarser than Butter Salt, of the same quality and is cheaper than common salt because it goes further and produces better results.

Genesee German Cheese Salt (Deutſcher Kaſe Salz) has no equal for Swiss, Limburger, Brick, etc.

Genesee Salt Never Lumps nor Hardens.

F. A. TRIPP, Chicago, Ill. **GENESEE SALT CO.,** New York, N. Y.

DAIRY AND STOCK FARMERS Will do well to inquire about the fine meadows in Aitkin county, Minnesota, where splendid stock lands can be bought for $3.00 to $5.00 per acre on 10 years time at 6 per cent interest. Cheap railroad rates whether you buy or not. For maps, rates and further particulars write L. B. ARNOLD, Agent, 901-5 Guaranty Building, Minneapolis, Minn.

Subscriptions in United States, Canada and Mexico $1.00 per year; 6 months 50 cents; 3 months 25 cents.

FOREIGN SUBSCRIPTIONS may be sent through Sampson Low, Marston & Co., St. Dunstan's House, Fetter Lane, London, Eng., or their agents, including the leading news dealers and book sellers in nearly all foreign countries.

All countries in the Postal Union $2.04 a year; not in the Postal Union $2.56.

Correspondents must not expect us to acknowledge the receipt of letters containing remittances for subscriptions. The receipt of the DAIRYMAN is sufficient notification that the money has been received. The label on the paper will show date to which subscription is paid. In case of renewals if date on label is not changed within two weeks after remittance is sent, inform us at once.

Remit by draft on Chicago or New York, or Post Office or Express Order; never by personal check.

ADVERTISING RATES.

Twenty-five cents per line, (agate measure) 14 lines per inch, each insertion.

Reading notices, 50 cents per line (nonpariel measure) each insertion.

WISCONSIN produced last year 64,000,000 pounds of cheese worth $5,000,000, and 100,000,000 pounds of butter, worth $20,000,000. It produced also 10,000,000 bushels of wheat; 32,000,000 bushels of corn; 75,000,000 bushels of oats; 16,000,000 bushels of barley; 3,000,000 tons of hay and 13,000,000 bushels of potatoes. It has within its borders 1,000 creameries and 1,600 cheese factories.

Random Jottings.

Factory Salesmen—Skimmed Cheese—Beef vs. Cheese—Cheese as Food.

ED. HOARD'S DAIRYMAN:—As a rule, the average cheese factory salesman, where there is a fluctuating market, stands, as it were, "between the devil—with a small d—and the deep sea." Its "you'll be damned if you do, and be damned if you don't." If, perchance, the market "springs a quarter," during the week after his last sale, a whole lot of patrons begin to howl; if it drops, and he did not sell, the same patrons and a whole lot more, set up a louder howl and they yell, "I told you so." 'S'nawful place to put a man; worse than chairman of the Filippino peace chappies; but most salesmen manage to get through the season, and be re-elected the next spring.

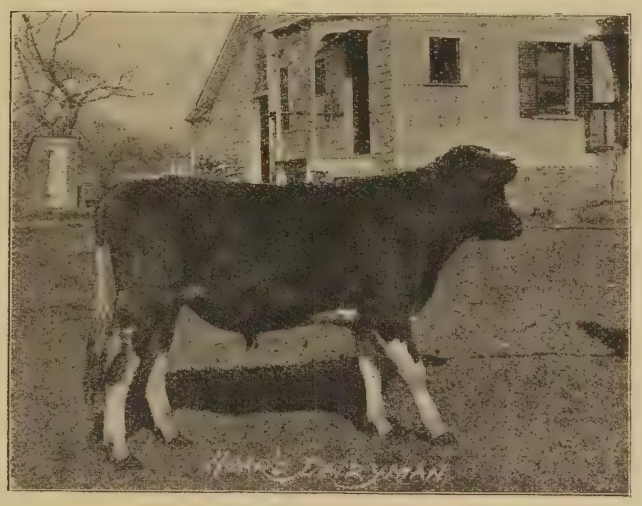
The Belleville factory has inaugurated the work of degeneration. It has begun the making of skimmed cheese. A few days ago the separators were started, there being a number of patrons who are having some of their cows come fresh in milk, and, desiring to raise the heifer calves, naturally want the sweet skim milk from the separator. They say: "At present prices for cheese and butter, there is the most cash in cheese; but, we want the skim milk, which is worth to us, twenty-five cents per hundred pounds, which more than makes up the difference in prices." Another patron has but little milk or does not want to raise any calves. He says: "Sweet whey is worth from five to eight cents per hundred, to mix with middlings for my pigs. These figures make cheese worth the most."

To bring about a compromise, the big separators were started and two-fifths of the butter fat removed. That goes as sweet butter to a commission house in New York, which caters to the Jew trade; the three-fifths—or what is saved from it—goes into the cheese hoop. No sales have yet been made of the cheese product, but the salesman thinks the price will not drop more than two cents below that of full creams. If he is correct in his estimate, there is more money in the combination than in either butter or cheese alone.

But what a depraved palate one must have who will buy a two-fifths skimmed cheese and pay within two cents of the price of a thoroughbred, well made and cured, full cream. If the cream constitutes the edible value of a cheese—and it should—when a full cream is selling for twelve cents, such a skim ought not to bring but about eight cents. It wouldn't score that much if I were to buy it.

Up in Lewis county they don't open the cheese factories in the skim degree. Not any; only the very best full creams are made. Result: Nearly all the prizes awarded at the state fair, go into that county, while the average price paid for Lewis county cheese is about one-half cent higher, for the year's make, than in any other county in the state. Imagine Herb. Cook skimming a "Crown-Brand" two-fifths and making "Moses" butter out of the product, then shipping the cheese to his patrons. Where would his markets be another year? You can't eat your cake and keep it too, nor take two good crops at the same time, off the same land, and continue the dodge a great while. The chickens will both come home to roost, dead sure, and not be long in making the journey, either.

A few weeks since, Dr. Jordan, of the Geneva experiment station, had a valuable article, devoted in part, at least, to the edible value of cheese, as compared with beef steak, in the *Rural New-Yorker*, and which has been quite extensively copied by the agricultural press. In it, we were told that the edible milk solids were worth fully twice as much as those in beef steak. The same statements have been made by the chemists of the station, and from Cornell, and by nearly every speaker on the "institute platform," during the last eight years; and we had come to accept the statement as true. But, there is no telling what will happen or "turn up." Every little while somebody comes along and upsets—or tries to—some one of our long cherished pet theories, or knocks down and smashes an idol or two, till we are left unprotected and alone, with our last condition, "wus than our fust;" and we know not which way to turn for relief.



Here is a case in point: A writer whose name is N. B. Franklin, in a recent issue of the *Jersey Bulletin*, has an article under the heading: "Erroneous Estimates of Cheese," in which he seemingly knocks into smithereens all of Dr. Jordan's and the other authorities' statements as to the superior food value of cheese over meat. He says in part:

"It is claimed that chemistry shows that one pound of cheese is equal to more than two pounds of meat without any bone—that $1.00 worth of cheese is worth nearly $2.50 of beef steak, at present prices. These statements are erroneous and misleading. They are based upon the potential energy of the proteid, carbohydrate and fat content of cheese, as shown by chemical analysis. They need to be corrected by its real digestibility in the human stomach.

Tested by chemical analysis, cheese has an exceedingly high value, but its indigestibility brings its nutritive value to a very low level. Moreover, with cheese, as with all other highly concentrated foods, individual idiosyncrasy becomes a controlling factor."

This writer, to prove the statements above made, quotes Dr. Edward Smith, of London, England, as saying in his work on foods, as follows:

"The value of cheese, as an article of diet, has not been entirely established. If we consider it in its chemical composition, we find it very rich—richer than any other known food—in its nutritive elements, provided we select a good specimen * * *

BOAZ COLANTHUS, H. F. H. B. 23425.

Property of J. LAWRENCE, Tioga Co., N. Y.

LUCKY REX, A J. C. C. 50989.

Property of O. A. BENN, Hodgdon, Me.

There is, however, a long standing belief that cheese is not easily digested, and, in fact, that, of any given quantity, much will pass off by the bowels, unused, and, so far as this is true, its nutritive value is lessened. That it is true, has been repeatedly proved by us when determining the amount of nitrogenous matter, which appears in the fæces, after eating cheese. * * *

While, therefore, it may be proper to eat a small portion of cheese, both for the nutriment which it supplies, and for the promotion of digestion, it is not proper to eat a large quantity or to make it a principal article of food, and a substitute for meat. Continuing, Mr. Franklin further says: "In regard to the use of cheese, as in so many other things, the many have been wiser than the few.

In spite of repeated advice and recommendation, the American people have refused to substitute cheese for meat.

In England, the poorer and cheaper kinds of cheese were once largely eaten in substitution for meat, by the poor laborers in South Wales, Somerset, Wilts, Dorset, and some other counties; but, in districts where meat was obtainable by the poor, as in Yorkshire, this habit did not prevail. Since the introduction of fresh meat from America and Australia, cheese has almost entirely ceased to be used as a substituie for meat.

The indigestibility of cheese is recognized in all cook books that give recipes for cooking it, and cooking soda is always added to the recipes to mitigate this indigestibility."

Now then, gentlemen, which horn of this cheese "critter" are you going to tackle? The institute season will open in a few days and, therefore, every speaker should "be armed and thrice armed with the double panoply of truth." It won't do for John Gould to get on his pins and begin to extol old Slicker's milk contingent as a cheese molecule, then back up the statement that a pound of old Slicker's cheese is worth two of her loin as an every day Western Reserve edible ration, unless this discrepency between Dr. Jordan et al, vs. Franklin and Smith has been disposed of in favor of the defendents. Not only John, but the other boys as well, must know whether it is cheese or cold beef steak in their sandwich before they begin to get too gay on the platform. It is a much more serious question to dispose of than is that immune Western Reserve horn fly problem.

Its true, John, but you may write me as one who loves good cheese, greatly preferring it to that immune beef steak we got one day in that Erie county village tavern. If, however, this is a condition, not a theory, as Grover once remarked, it is time you fellows who are to "holler" in the institute halls, this winter, discovered the true microbe or bacterium in the ration. C. W. JENNINGS.

Belleville, N. Y.

Special-Purpose Profits.

ED. HOARD'S DAIRYMAN:—On page 612 of HOARD'S DAIRYMAN, September 15th, 1899, appears an article by T. J. F., of New York, entitled, "Selection of Breeds," in which attention is called to an article from my pen, written some two years since, in which an attempt was made to combat his statement in a previous article, that a general-purpose, beefy type of a cow was more profitable on a farm than she of the Guernsey-Jersey type. The reply referred to, gave an actual demonstration, with figures of the comparative net product of twenty cows of the Guernsey-Jersey type as against that of the twenty Short-horns that he introduced. The final summary developed that the former produced an annual income of $1,108, amounting to $55.40 each, while that of the general-purpose type was $571.36, amounting to $28.57 each. A careful re-examination of that statement gives no occasion to diverge from the positon then taken, and until my New York friend demolishes the comparative statement referred to, thus making the position there taken untenable, I shall remain firm in the conviction that the cow of the specific dairy type is a larger profit producer, than she of the all-purpose type. Butter in McGregor is selling at 25 cents per pound. My dairy type cows (fifteen) are yielding a pound a piece each day on pasture alone. FRANK KINSLEY.

McGregor, Iowa.

FRESH milk does not exist in China. Hence this country is an inexhaustible market for condensed milk. It is imported via Canton or Antwerp and sold by German and English firms.

AN OLEOMBGARINE ORGAN.

Every farmer in Wisconsin should know once for all that the Milwaukee *Evening Wisconsin* is an oleomargarine organ. It has for years taken every opportunity to defend the fraud in its editorial columns, and is no doubt retained by the Chicago Oleo Combine as their special defender in Wisconsin.

THE PRESENT STATUS OF OLEOMARGARINE LAWS.

It would puzzle even the legendary "Philadelphia Lawyer" to understand the various decisions in oleomargarine cases. Not to mention the Chicago courts, which have a way, all their own, of construing statutes, based apparently upon the theory that the ordinary consumer and the producer of honest goods has no rights, which either the Chicago manufacturer or Chicago courts are bound to respect, it is manifest that United States judges are extremely sensitive lest state legislatures should infringe upon the prerogatives of congress in the way of interfering with inter-state commerce.

The latest devotee to this fetish is Judge Lochren, of Minnesota, who has not only reversed one of his own decisions, but has gone so far as to assume, contrary to its own solemn declaration, that the United States Supreme Court has reversed its decision in the Plumley case, which held the Massachusetts anti-color law not in conflict with the commerce clause of the federal cosntitution.

It may be difficult for judges who are not posted as to the facts, to understand why the reasoning of the court in the Schollenberger case, which holds the Pennsylvania anti-oleomargarine laws void, did not lead the court to a formal reversal of the Plumley case, a conclusion to which much of the argument did, in fact, tend, but the distinction between the two cases is, that whereas the Pennsylvania statute prohibited the sale of all oleomargarine, the Massachusetts statute only prohibited the sale of that which was colored to resemble butter, and thereby rendered so difficult of detection that frauds could be all too easily perpetrated. The circumstance that Massachusetts did not forbid the importation and sale of oleomargarine, in its own color and on its own merits, gave the commerce clause of the United States constitution all the scope that could rightfully be claimed for it, for, as Justice Harlan well said:—"*The Constitution of the United States does not secure to anyone the privilege of defrauding the public.*"

But the Pennsylvania law, by attempting to exclude all oleomargarine, regardless of whether it could or could not be made contributory to fraud, was declared to be in conflict with congressional legislation, and we confess to no little surprise that Judge Lochren failed to differentiate the two cases. That he did not do so is plainly apparent from the following extract from his "opinion" in the Minnesota case, recently decided by him:

"The doctrine which has apparent support in the Plumley case, that a state may exclude from its markets, and absolutely prohibit the sale of an admittedly wholesome article of food merely because designedly prepared to resemble so closely another more generally desired article for which it is a substitute, that persons may be easily deceived, and have it imposed on them for the other article, is plainly contrary to the holding of the supreme court in the Schollenberger case, and untenable since that decree in which the court announces that 'the legislative policy does not extend so far as to embrace the right to absolutely prohibit the introduction within the limits of the state of an article like oleomargarine, properly and honestly manufactured.' "

Had the Minnesota statute, like the Pennsylvania law, entirely excluded oleomargarine, the doctrine of the Schollenberger case would have applied. But it did not do this. Judge Lochren did not claim that it did, for the opening paragraph of his opinion reads as follows:

"This case arises from the attempted enforcement of a statute of the state of Minnesota designed to prevent the sale, or having in possession for the purpose of sale, of oleomargarine colored with any coloring matter so as to resemble butter made from cream."

There has been a decision in Maryland to much the same effect as this one by Judge Lochren, so that we are now confronted with the condition that while the United States Supreme Court, nominally at least, recognizes the validity of the so-called anti-color laws, it furnishes a line of reasoning which leads state and inferior federal courts to make the anti-color laws inoperative and of no effect.

Further legislation by congress is therefore absolutely imperative, and with more than three-fourths of all the states on record by their statutes, passed not hurriedly, but after mature deliberation, as opposed to the traffic in colored oleomargarine, it would seem that appropriate legislation could be had without much difficulty or delay, provided those who favor such legislation do not divide and quarrel too much among themselves. We have advocated the taxing of colored oleomargarine in such amount that it cannot be sold at a large profit for less than good butter ought to command. We have also advised inserting in such a law, a proviso that nothing in it should be held to authorize the sale of oleomargarine contrary to state laws and municipal regulations. The resolutions adopted by the Farmers' National Congress, at its late meeting in Boston, and by the Dairy and Food Commissioners more recently at their meeting in Chicago, goes a step further than this and demands an increase of the tax on all oleomargarine, whether colored or not colored, to ten cents per pound. If congress will give us such a law, we shall not object, but we must insist that a tax sufficiently large to give genuine butter a fair show in the market, and afford some measure of protection to the ultimate consumer, shall be placed upon the colored article, "because" as Judge Lochren well says:

"of the facility with which it can, by dishonest dealers at retail and keepers of inns and boarding houses, be put off as butter upon customers and patrons who desire only butter, and would not knowingly use oleomargarine."

INQUIRIES AND ANSWERS.

Every inquiry must be signed with the name, Post-office and state of writer. Condense the questions into plain specific inquiry. Be careful to note if your questions have not been answered in replies to others. We are glad to answer all the pertinent questions that we can concerning machinery. Look over our advertising columns and write to the advertisers.

The editors of HOARD'S DAIRYMAN are reluctantly compelled to announce that it is utterly impossible for them to answer inquiries by personal letter and not neglect their other and more imperative duties. They would most willingly do otherwise if they could, and therefore beg that this notice may be accepted as a general answer to all such requests.

WHERE MILK IS SOLD BY QUALITY.

Would like to have you give me a balanced rations from the following, and if you can suggest any additions would be glad to have them. We sell our milk wholesale and price received is according to quality; for each half per cent of butter fat above four per cent we get one cent per gallon additional to the market price; that is to say if four per cent milk is worth twelve cents per gallon we would get fourteen cents for five per cent milk. We are interested in quality and quantity.

I have on my farm twenty-five grade Jerseys and a registered Jersey bull. From this on I expect to raise my heifer calves. Have my farm run on shares, giving my dairyman half proceeds. Hope to have a silo in another year. Feeds used: Middlings, $17.50 per ton; bran, $16.00 per ton; cob meal, $14.00 per ton; timothy hay, $12.00. Corn stover I cannot give a price per ton, but I bought 580 shocks of corn and allowed $81 for the fodder.

I have been reading the DAIRYMAN for the past two years, but had my dairy leased in such a way I could not follow its suggestions, but since Oct. 1st, have a new dairyman and a new lease and we expect to profit by the suggestions of your excellent paper.

Beaver, Pa. G. C. McJ.

We wish it was within the truth to say to this inquirer that he can at will change the quality of the milk from his cows by a modification of the ration allowed. This was the universal belief only a few years ago, but careful experiments in many places have proven that it is the individuality of the cow and not the character or amount of feed eaten (provided she is reasonably nourished) that determines the per cent of fat in the milk. We can modify the quantity, from practically none at all to the extreme limit of her capacity, by giving or withholding appropriate feed.

It should never be forgotten that protein is the one element in feed without which the cow cannot make milk. Protein is necessary for other purposes also, but very much less is required for such purposes than for furnishing casein in the milk. (See page 754.) The amounts of digestible protein required by the cow giving milk will, therefore, vary with the amount of milk given. The main point, therefore, in forming a balanced ration is to make sure that it contains sufficient digestible protein for the individual animal, due regard being had to the quantity of milk returned. Experience seems to have proven that the average amount required for this purpose is from two pounds to two and a quarter pounds.

With this primary fact always in mind let us try to formulate a ration from the feeds named commencing with the roughage. We cannot expect a cow to eat more than about fifteen pounds of timothy and ten pounds of corn stover. In fact, this is more than most cows will eat, especially when furnished with a suitable amount of grain. Suppose we limit the hay to twelve pounds, and then by referring to the table on page 754 we find that this amount of hay and stover will give us dry matter and digestible nutrients as follows:

	Dry Matter.	*Digestible Nutrients*		
		Protein.	Carbohydrates	Ether Extract
12 lbs. timothy hay...	10.42	.34	5.21	.17
10 lbs. corn stover....	5.95	.17	3.24	.07
Totals.....	16.37	.51	8.45	.24

We have now not more than one quarter of the digestible protein required and the question is where can we find the remaining one and a half pounds. Ten pounds of bran will give only one and one quarter pounds, and twenty pounds of corn and cob meal only a trifle more. Manifestly we must search for something carrying more protein. Oil meal, cotton seed meal, gluten meal and gluten feed are the most available for this purpose, and when there are neither roots nor silage to go with dry feed, some oil meal is very desirable in order to keep the digestive tract in good order and thus insure proper and full digestion of other feeds. But the price of oil meal at present is almost prohibitive and hence we must use it as sparingly as possible. Taking roughage as before, let us add grain as follows:

FORMULA FOR RATION.	*Dry Matter.*	*Digestible Nutrients*		
		Protein.	Carbohydrates	Ether Extract
Hay and stover as above.....	16.36	.51	8.45	.24
4 lbs. corn and cob meal.....	3.56	.26	2.52	.14
4 lbs. bran.....	3.52	.50	1.34	.12
2 lbs cotton seed meal	1.84	.74	.34	.17
1 lb. oil meal.....	.91	.29	.33	.07
Totals.....	26.20	2.30	13.18	.74

This is probably somewhat more than will be necessary as an average and we should make such reduction as may be desirable in the corn and cob meal and timothy hay, as both of these have a market value greatly in excess of their relative feeding values.

A MISSOURI RATION.

Please give me ration formula from oil meal, $25 per ton; cotton seed meal, $24.40 per ton; wheat bran, $13 per ton; oat chop, $12 per ton; oat hay, $4 per ton; millet, green and bright, no seed, $4 per ton; clover, $4 per ton; clover and timothy, $4 per ton, and corn, 25c per bushel. Kafir corn fodder with the grain. I have raised the hay and corn; have grinder to grind corn with cob.

Am a would-be dairyman, so of course green. Any pointers you may give me, will enable me to change the above color. Paper farmers are winning out. The Uncle Josh kind claim the land is a little too high.

Cameron, Mo. O. S. A.

If the "oat chop" is genuine and unadul-

terated ground oats and not a lot of oat hulls from some oat-meal mill, it is the cheapest feed named. We have a suspicion that it is not the product of whole oats ground and if such is the case, do not purchase. There is an embarrassing variety of coarse fodder (roughage), but as there is nothing quite so good for milch cows as clover hay we would advise using that exclusively with a little oat or millet or both, just for variety.

The following combination makes a very acceptable daily allowance for Jerseys:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
15 lbs. clover hay.....	12.71	1.02	5.37	.26
4 lbs. corn and cob meal.....	3.56	.26	2.52	14
4 lbs. bran.....	3.52	.50	1.54	12
1 lb. oil meal.....	.91	.29	.33	.07
Totals.....	20.70	2.07	9.76	.59

In addition to the above give as much of the other hay or kafir corn fodder as each cow will eat, not forgetting, also, the daily allowance of salt.

A FLORIDA RATION APPROVED.—WHAT TO DO WITH A DAINTY COW.

What do you think of the following ration for grade Jerseys: Twenty pounds ensilage, with the ear corn cut up, ten pounds mixed hay (beggar weed, crab grass, etc.,) green pasturage, presumably thirty pounds a day, and a mixture of feeds, six pounds bran, four pounds cotton seed meal and three pounds corn meal and a feed of about five pounds and upwards a day of this, more or less, according to cow's capacity for returns?

What would you do in feeding a cow fresh three weeks—that is on fair pasturage—and having a feed of, say ten pounds hay (above mentioned) and five pounds grain, as above proportioned, that does not eat up clean that amount of grain?

Ration above first mentioned is one calculated on for future when I open silo, at which time I anticipate having a pasture of winter Florida grasses.

We estimate the ration above indicated will contain dry matter and digestible nutrients about as follows:

	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
20 lbs. silage.....	4.18	.18	2.26	.14
30 lbs. pasture grass.	6.00	.75	3.06	.15
10 lbs. hay.....	8.24	.57	3.97	.14
5 lbs. grain as above.	4.50	.95	2.00	.25
Totals.....	22.92	2.45	11.29	.68

It is somewhat doubtful if cows in a Florida climate will eat as much as this, but if they will we are unable to suggest any modification.

Concerning the cow with dainty appetite, we can only suggest that possibly she may not relish some of the ingredients in the grain mixture. Cows are not unlike men, women and children in this respect. It may be that some of the ingredients are a little off in quality or stale. Make a careful examination, and in various ways try to humor the cow's likes and avoid those things she dislikes. If not already doing so, try adding a very small tablespoonful of salt to each feed.

SIZE OF FEED CUTTER.

What is the largest size feed cutter that it is practical to use with two horse power, tread or sweep? Horses are heavy ones.

Duluth, Minn. J. B. McL.

Two horses on a tread power are easily equivalent to three on a sweep power and quite frequently to four. A large cutter will run practically with as little power as a small one when doing the same work. The present writer uses a 12-inch cutter, but from the first has regretted that it is not larger. When he buys again, the cutter will have 16-inch knives, and then an engine can be used to good advantage, whenever desired.

A QUEBEC RATION.

Kindly formulate balanced ration for cows that freshened from January to June, and that are giving an average of nineteen pounds daily. I have mixed timothy and clover hay, corn ensilage (limited quantity,) rutabaga turnips, pea and oat meal. Can buy bran for $15, cotton seed meal, $23.

If not too much trouble would thank you for an answer by mail, as cows will come to barn very soon, and I suppose it would be two or three weeks before it would appear in the paper. E. P. R.

Barnston, Que.

The request to reply by mail is answered by the notice at the head of this department. Of course the writing of one letter would not seriously interfere with our regular work, but unfortunately there are so many who, for one reason or another, prefer a personal reply, that we feel compelled to adopt and adhere to the rule of replying only through the paper. We shall use our best endeavor to answer all inquiries promptly, and especially such as have not been substantially answered in recent issues, in reply to other readers.

In the present case, premising, as we have so often explained, that the feeder must himself exercise judgment and discrimination, and apportion the feed with regard to the capacity and condition of each cow to respond, we submit the following as a fair average daily allowance for the several cows:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
25 lbs. silage.....	6.60	.33	3.50	.18
10 lbs. timothy hay..	8.53	.48	3.96	.16
20 lbs. rutabagas.....	2.28	.20	1.62	.04
4 lbs. peas and oats mixed.....	3.57	.52	1.98	.10
4 lbs. bran.....	3.52	.50	1.54	.12
1 lb. cotton seed meal	.92	.37	.17	.08
Totals.....	25.42	2.40	12.77	.68

If the cows are much below 1,000 pounds in weight, it might be practicable to take away one pound each of the combined peas and oats, and the bran.

A WISCONSIN RATION.

Please formulate a ration from plenty of clover hay and corn fodder that we will run through the cutter, stalks and all; the rest of our feed will have to buy. Our cows are grade Jerseys. Is it better to keep on with the Jersey or cross with the Guernsey? Will the Guernsey give any more milk?

Suldal, Wis. S. G. T.

We recommend a trial of the following:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
10 lbs clover hay. ...	8.47	.68	3.58	.17
10 lbs. corn fodder...	7.10	.37	4.04	.12
4 lbs. bran.....	3.52	.50	1.54	.12
4 lbs. gluten feed....	3.69	.82	1.94	.14
Totals.....	22.78	2.37	11.10	.55

If any cow will eat more roughage, either hay or corn fodder, let her have it. Profit comes from giving each cow all she can eat and turn to milk. Strive to see, not how little, but how much you can encourage each cow to eat and not increase too much in live weight.

It is not good policy to mix breeds, but it is good policy always to get the best sire of the breed you have.

Good Jerseys will give all the milk and make all the butter any reasonable man can demand, provided they are properly fed and cared for; and without such feed and care no cow will do well.

A KANSAS RATION.

My old cows are mostly Durhams, with some Jersey and Holstein mixture, but the younger ones and heifers are all grade Holstein. The average test at the factory is 4.2; the lowest, 3.8, and the highest 5 per cent butter fat.

My rough feed is good prairie hay, $4.50 per ton; clover and timothy (early cut), $9.00; kafir corn and hay (early cut, all bright and nice cure) $4.50 per ton. My grain is: Bran, $12.00; corn, 23 cents per bushel and oats 20 cents. I have a mill of my own, and grind the corn and cob and oats together; oil meal is $32.00; cotton seed meal and gluten feed we do not have in our market.

I have a good many pumpkins at present that I am feeding. You speak of feeding so many pounds of hay in your rations. Is that all the hay or rough feed that they get in a day? F. T.

Pittsburg, Kan.

That clover and timothy hay is first class roughage, but it is not worth twice as much as the other varieties. Bran at $12.00 will furnish protein cheaper than clover and timothy at $9.00; and so will oil meal at $32.00. We therefore suggest a daily allowance of, say 4 pounds bran, 3 pounds corn and cob meal, 3 pounds oats and 2 pounds oil meal, with all the roughage each cow will eat, which will possibly be not far from 10 pounds of the prairie hay, and the same amount of kafir corn and cane hay.

Our formulas are intended to give the total amount of roughage and grain required for an entire day; but this is simply an approximate estimate. If a cow will eat more than we specify, she should have it; and conversely, if she does not eat it all with good relish, give her less. Formulas for rations have their value, but they cannot supercede or do away with the exercise of good judgment by the feeder.

OLD BREAD FOR COW FEED.

Would you please tell us whether old bread can be used to advantage for milch cows, and, if so, how would you use it? It can be bought for little money, per load, and as feed is right high, I would think that it would be a good substitute to mix. Some of the bread contains lard, either inside or on the baking pans. I know not if it is healthy to use. Cake and doughnuts are sometimes included in a load, which I am also in doubt as to their healthfulness. W. A.

Norfolk Co., Va.

It depends entirely on the price at which the bread can be obtained.

The nutritive value of white bread is about on a par with corn meal, and in buying it you could afford to pay about the same price per ton. If it is broken up in a mill and fed in about the same proportion as corn meal, there is no reason why it should not be used. But it all depends on the price.

Dried bread is very light, and being misled by the bulk, you may be paying more for it than it is worth.

The small amount of lard will not make any difference.

A VERMONT RATION.

I notice that some good dairymen and breeders are feeding equal parts of corn meal and bran. Is this a well balanced ration to feed with corn fodder having some small ears, and some pasture feed, or to feed later in the fall with mixed hay and corn stalks? Price of corn meal, $28 per ton; bran, $18 per ton; oats (ground,) $20 per ton; timothy hay, $20 per ton; mixed hay, $—per ton. This I think, would be a convenient ration for the average Vermont farmer, as most of us raise oats and corn. We can buy other feeds, such as cotton seed meal, oil meal, gluten fed, etc.

Cheese is selling for 13 cents at the station, and we naturally wish to feed as much grain as possible without injury to cows.

Vt. "A NEW ENGLAND FARMER."

We wish our friend had given us the prices at which he can buy oil meal, cotton seed meal and the glutens. There are about nine chances in ten that they would be much cheaper than any of the feeds named. More than this, we suspect that the cows for which this ration formula is wanted, have been milking several months, and are expected to be fresh again next spring. If this is the case, they require quite a different ration from one that would be suitable for cows that had not been milking more than two months. And still fruther, we account this frozen pasture grass of very little account.

If the cows have been milking six months or more, the combination of bran, oats and corn, equal parts by weight, will probably suffice, but otherwise we should certainly add some of the highly nitrogenous feeds—and, probably under all the conditions, would prefer cotton seed meal—but not more than two pounds per day, and this amount to be reached by gradual advances. In addition, if the cows show any tendency to costiveness, as they are likely to do in the absence of roots or silage, some oil meal may be used to good advantage. After this add the mixed grain in such amounts, as will cause each cow to do her best, keeping a record of the milk yield from day to day. Whenever any cow fails to respond, after a reasonable time, to the increased feed, and instead of turning her surplus feed into milk, turns it to increase of weight, the evidence is conclusive that she is receiving too much grain. In such a case it is only common sense to reduce her allowance.

In general terms, we may say that these cows should be expected to eat about ten pounds of the mixed hays, and ten pounds of corn stover, with about six pounds of the mixed feed, and cotton seed meal and oil meal as suggested.

CAPACITY OF SILO.—CUBIC FEET IN A TON OF HAY.

How many tons in silo 12×16×20 feet deep?

How much hay in bulk—tons—10 feet deep, 20 feet wide and 30 feet long?

Roanoke, Va. C. W. T.

A silo of the size given above will hold about eighty tons.

The weight of a cubic foot of hay is an uncertain quantity, depending on the size of the stack or mow, and the age and quality of the hay.

Depending on these conditions, it will vary from 340 to 500 cubic feet per ton. Taking the average of the above, a stack the size given, will contain a little over fourteen tons.

COLD STORAGE FOR CHEESE.

Will you be so kind as to give me an idea how to build a cold storage for cheese, 24×36? The best way to build, expense or cost of such a one, and is there any expense to run one after it is built. W. J. E.

Dana, Iowa.

The building of a successful cold storage room is not by any means an easy task, especially for a novice. The best way to do is to correspond with manufacturers, who make a specialty of such work, and follow their recomendation. The first cost will be more, but it will be less expensive in the long run.

A CALIFORNIA RATION.

Kindly give me the best ration out of the following feeds for Jersey cows, from seven to eight hundred pounds: Plenty of oat hay and grass hay; wheat bran, $20; middlings, $23; small potatoes, $5; other feeds can be purchased if needed to balance ration.

Eureka, Cal. H. E. A.

"Grass hay" is altogether too indefinite a term for use in formulating a ration. It may have a specific application in California, but in Wisconsin it might mean timothy or red top, or a dozen other varieties, each with a different feeding value. We can do no better under the circumstances than to suggest feeding from eight pounds to ten pounds of bran, ten to twenty pounds of potatoes and all the hay each cow will eat. Four pounds of potatoes are accounted to have about the same feeding value as one pound of grain.

SOUR MILK FOR CALVES.

Have been feeding calves from three to six months old, out on poor pasture, on sour milk, and when warmed turns to whey and curd. They seem to like it; have had it all summer. Will it injure them? H. E. A.

Eureka, Cal.

H. E. A. would seem to be most competent to answer this question from his own experience. We have seen excellent calves reared on such milk, with some oats and corn added. It is, however, dangerous to feed sour milk one day and sweet milk the succeeding day. It is also pretty conclusively established that clabbered milk is less dangerous than that which has only partially soured.

RYE FOR HAY.

What quality of hay does rye make, and when is the proper time to cut it?

We will be milking 100 cows here this winter, and we propose to chop our hay and mix mill feed with it; the mill feed is shorts, bran, and middlings altogether.

How many pounds of hay and mill feed should we feed to each cow per day? How

much can we afford to pay per ton for mill feed to feed the cows, properly taken care of, and sell our butter at twenty cents per pound?

Balk, Cal. H. E. N.

There is a very wide difference of opinion as to the feeding value of rye hay and rye straw. Some Wisconsin dairymen of our acquaintance consider them superior to either oats or wheat hay and straw, and others hold them of comparatively little value. Any crop which is to be made into hay should be cut before the seed begins to mature, or in fact, before it is fully formed.

Cows that have not commenced to shrink, if of fair dairy ability, should have not less than ten pounds daily of the feed described, and some no doubt would richly repay for even more than this. Where one is milking 100 cows, he is liable to have some unprofitable, non-paying boarders that it would pay him to kill outright if they could not be otherwise disposed of—and some that will respond profitably to high feeding. No man can write a formula that will answer for each of several cows, and a feeder that follows a formula blindly, without regard to results, is not wise. So long as the cow responds to increasing feed with a profitable increase of milk, one may be sure he is not feeding too much.

Always feed as much hay or other roughage as each cow will eat with relish.

WIDE VARIATIONS IN FAT CONTENT.

The cheese maker of our cheese factory has been making Babcock tests for the patrons of his factory. The tests have run from 1.5 to 8.4 butter fat. Do you consider tests showing such a variation correct? Isn't a test showing 8.4 butter fat to be mistrusted. T. Q.

East Hartford, N. Y.

The accuracy of such figures as the above, depends, to a certain extent, on the milk, and until we know whether the samples were taken from fresh cows or strippers, it is impossible to say if the work was accurate or not. We have seen milk, from cows far advanced in lactation, show 10% of fat, but only a very small amount of milk was given. We have also tested milk from animals that had run in a dried up pasture with no other feed, that showed below 2.0%. Therefore, we hesitate to say that such variations may not be correct, although the chances are greatly against such wide variations being found in the same factory, at the same time.

A little quiet investigation as to the methods used in sampling and testing, would throw more light on this subject than we are able to furnish.

BUCKWHEAT BRAN.

Is buckwheat bran good for dairy cows? If so, how would you feed for milk? Am using gluten meal, and sell milk to town customers and want it right. A.

Watervliet, Mich.

The table of feeding analyses to be published this week answers these questions in part. Buckwheat bran has a very considerable feeding value but it is not easily digested, and unless it can be had very cheap or has a good proportion of the middlings with it, is of doubtful economy. Neither this bran nor gluten meal will injure the quality of the milk.

AN OREGON RATION.

It gives me pleasure to state that your paper has been of inestimable help to me. I come to you for more help. We do not often find any rations as formulated in your paper applying to this particular region. We do not raise much corn owing to early and late frosts, and oil meal and the like would cost $30 per ton and more. Our selection is narrow therefore. We have alfalfa in plenty. Can raise sugar beets and probably corn about three years in five. I will give you our available feeds this winter—we will be better prepared next summer. Alfalfa at $6; wild hay at $5 (our selected wild hay is fine, containing wild clover). Oats 85c per cental; barley, 70c; bran, $12; wheat, oat and barley straw. Please make me a ration.

Your rations nearly invariably include corn, cotton seed meal, linseed meal or the like, which renders them valueless for this section. If you will formulate a balanced ration out of the stuffs mentioned you will oblige a very large territory of people in eastern Oregon and Washington. Expressing my appreciaiion of your assistance in the past, I remain, E. M. S.

North Powder, Ore.

There should be little trouble in getting a very satisfactory ration from the feeds named. We give a formula below, assuming that the Oregon wild hay is the equivalent of the best Minnesota prairie hay.

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
10 lbs. alfalfa hay	9.16	1.10	3.96	.12
10 lbs. wild hay	8.75	.35	4.18	.14
4 lbs. oats	3.56	.37	1.89	.17
4 lbs. bran	3.52	.50	1.54	.13
Totals	24.99	2.32	11.57	56

This ration would in our estimation, be better if it contained at least twenty-five per cent more ether extract (crude fat) and it is for this reason that we so urgently recommend corn for use with alfalfa hay. Oats will answer for this purpose fairly well, but they are usually more expensive than corn. Something in the way of silage or roots, to furnish succulence and keep the digestive tract in good order, would also be a distinct advantage. In the absence of anything of this character, a little linseed oil meal even at $30 per ton, might prove a good investment, for feeding now and then to cows, if any, whose manure showed a too dry or feverish condition of the bowels. Regular salting tends to prevent this condition also.

EGYPTIAN CORN WITH ALFALFA.

I would like to know if ground Egyptian corn will be good to feed milch cows through the winter. The cows have alfalfa and wheat hay; alfalfa will last about two months and wheat hay the balance of the time. They will have pumpkins for three months. They will have pasture consisting of salt grass and a small amount of green feed (foxtail.)

If it will be more profitable to feed other grain at one cent a pound than this at three-fourth cents a pound, state what it is, because I can sell the corn. THREE C'S.

Hanford, California.

Egyptian corn will do very well with alfalfa hay as has been demonsrated by actual trial in Kansas, but would not furnish sufficient protein with the wheat hay. If it can be done, the proper course to take would be to feed the two kinds of hay in alternation—say alfalfa in the morning and wheat hay at night. Alfalfa is rich in protein, the one indispensable nutrient for making milk. We are not sufficiently advised to say whether the ground Egyptian corn can be prudently fed without mixing it with something lighter and more bulky. If it weighs as heavy as common maize we should advise mixing some bran with it, unless a part of the hay could be chaffed and used for that purpose.

A NEBRASKA RATION.

Can you give me a balanced ration for cows, with feed as follows: Sheaf oats, millet hay, ensilage, of corn well eared, and bran. Have also good early cut prairie hay.

Riverton, Neb. B. F. T.

It is hardly practicable to use all the varieties of fodder named each day. We should feed about twenty-five pounds of silage and ten pounds of bran daily and in addition as much of the sheaf oats, millet and prairie hay as each cow would eat, using if convenient, one kind at night and another in the morning, and little or nothing at noon.

AN ONTARIO RATION.

Would you please give me a ration from the following, and how much should be fed daily to an average cow, say 900 to 1,000 pounds: Hay, timothy and clover mixed, $8 to $10 per ton; bran, $14; oats, ground, $19; peas, ground, $22: barley, ground, $20.

Ontario. F. D.

As an average for an entire herd, the total being apportioned according to the ability of the several cows to make good use of their feed, regard being had to the length of time each had been in milk, as well as to normal capacity, the following ought do give fairly good results:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
18 lbs. mixed hay	15.36	.86	7.13	.29
8 lbs. bran	7.05	1.00	3.09	.24
2 lbs. peas	1.79	.34	1.04	.02
Totals	24.20	2.20	11.27	.55

Notes From the Indian State Fair.

An Excellent Practice Introduced.

ED. HOARD'S DAIRYMAN:—On Friday morning of state fair week the Indiana State Dairy Association, H. E. Van Norman, La Fayette, Secretary, held a meeting on the fair grounds.

Exhibitors of Ayrshires, Jerseys, Guernseys and Holsteins led out representative animals for illustration of dairy types In an informal way, Prof. C S. Plumb, of the Indiana Experiment Station, Mortimer Levering, of La Fayette, and Mr. Axtell, of Ohio, discussed the dairy type as an ideal which the breeder is striving to produce. They used the animals present to illustrate their remarks. It was a question of type or form for dairy performance, and the animal was not discussed as a representative of her breed. Questions and discussions lasted for an hour. All were disappointed that Mr. Peer, judge of dairy cattle, was unable to be present, as expected when the meeting was called.

The strong wind and the hum of machinery were somewhat distracting, nevertheless the effort to give an opportunity for study of dairy form was a success and deserves to be repeated another year under more favorable surroundings.

The Fair authorities have enlarged the Dairy building by adding an amphitheater, seating about 700 people, facing a space which was occupied by Purdue University, as a working dairy. Here all the operations of the dairy were carried on twice each day by students from the Dairy School under direction of the instructor. Milk was separated, cream ripened and churned, butter worked and printed and the Babock test in frequent operation. Large audiences watched with keenest interest the progress of the work, asking questions as to principles and practices.

The showing of butter and cheese was extremely small but of excellent quality. T. H. Gallagher, of Chicago, placed the scores—1st. on creamery butter going to H. S. Newby, Spiceland creamery, score, 97; 1st. on dairy to Peter Raab, Brightwood, 97; Dairy prints, J. H. Ward, Thorntown, 98. Twin cheese, 1st. W. L. McCain, Hortonville, 93; 2d. Boyd and Drischel, Cambridge city, 88; 3d Groveland Cheese Co., 85, and Boyd and Drischel 1st on Young Americas. REPORTER.

La Fayette, Ind.

We commend without reservation the plan originated at the Indiana Fair of bringing out the cattle from the different breeds and having them compared and criticised from the exclusive dairy point of view, and this not for the awarding of a prize, but for the instruction of the attending dairy farmers.

MISREPRESENTATION AND MILK POISONING GO HAND IN HAND.

When men give themselves up to counterfeiting, or tampering, with human food, either as makers and vendors of oleomargarine or manufacturing dangerous compounds to put in milk, they soon lose all manhood and character This fact is clearly brought out by a correspondence which F. W. Moseley, of Clinton, Iowa, has lately had with Heller & Co., manufacturing chemists in Chicago. This firm is largely engaged in manufacturing and pushing the sale of a formaldehyde milk preservative, called "Freezine." During the session of the U. S. Senate Committee, called the "Pure Food Committee," in Chicago, this firm came before the committee to testify concerning their compound.

Previous to this Heller & Co. tried to induce Mr. Moseley, who is of the dairy supply firm of Moseley & Pritchard M'f'g. Co., to handle their "Freezine." Mr. Moseley objected because he feared that the article was injurious to health. In response to his letter stating his objections, Mr. A. Heller, of the Heller Co., wrote the following letter:

B. HELLER & CO.,
MANUFACTURING CHEMISTS,
CHICAGO, U. S. A., May 22, 1899.

F. W. MOSELEY, ESQ., CARE OF MOSELEY & PRITCHARD, Clinton, Iowa.—DEAR SIR:—In the early part of April our Mr. Hill called on you and tried to induce you to handle Freezine. You told our Mr. Hill that if we would get the endorsement of some government authority of this country, you would then endorse the Freezine through every paper that you write for, and would also handle the goods; but that you never would handle them until you are sure that they are healthful. What you wanted was the endorsement of some one who is authority. As we understand it, you first want to be convinced that Freezine is not injurious and then you will handle it. We are fully aware that you can do us much good by handling the Freezine and also endorsing it.

As we are now in a position to give you an endorsement from the highest authority of this country, we take the liberty of writing to you.

You, of course, are aware that the United States Senate appointed a committee, called the "Pure Food Committee." The committee met in this city last week. The writer was requested to explain about our Freezine and some of our other preparations. You can readily understand that the writer could not very well explain our formulas, etc., in the presence of reporters; therefore, the writer requested the permission to explain in the presence of the commissioners alone. This permission was granted, and because all of the reporters were requested to leave the room, the reporters of course were displeased and therefore wrote sensational articles about

"Honor is Purchased by Deeds We Do."

Deeds, not words, count in battles of peace as well as in war. It is not what we say, but what Hood's Sarsaparilla does, that tells the story of its merit. It has won many remarkable victories over the arch enemy of mankind—impure blood. Remember

Hood's Sarsaparilla
Never Disappoints

Hood's Pills cure liver ills; the non-irritating and only cathartic to take with Hood's Sarsaparilla.

Finer Flavor, better quality, better price; that's what results from the use of the Champion Milk Cooler–Aerator in your dairy.

CHAMPION MILK COOLER COMPANY,
67 Main St., Cortland, N. Y.

some of our preparations, including Freezine. These articles were not true.

After the writer explained our Freezine, Dr. Wiley, of the United States Agricultural Department, made a statement, a copy of which we herewith enclose. We will forfeit $1,000 if that statement is not true.

You will understand the writer gave the Department much valuable information and explained to them the value and also healthfulness of Freezine. The writer furnished the committee with medical reports from scientists, chemists and physicians endorsing the use of the very chemicals used in our Freezine. It was on the strength of all these reports from professors of this and foreign countries, who are high authority, and from the testimony given by the writer, that Dr. Wiley made the statement that he did.

From the statement you will see that our Freezine has been endorsed by the highest authority of this country, Dr. Wiley, of the United States Agricultural Department, of Washington. Such an endorsement certainly speaks highly for our Freezine.

Will you kindly let us know whether you now feel disposed to handle the Freezine for us? We are sure that it will be mutually beneficial, and we know that you are in a good position to sell quite a good deal of the Freezine. We will make you a liberal discount, so that it will pay you well to handle Freezine.

Thanking you for a prompt reply, we are,
Yours very truly,
B. HELLER & CO.
PER A. HELLER.

P. S.—We enclose herewith a booklet treating on the healthfulness of Freezine. Please read the booklet carefully, as it will give you much information. If you desire it, we shall be pleased to explain to you why Freezine is healthful for infants, and why Freezine should be used by every milk dealer. B. H. & Co.

The following is the statement made by Heller & Co. in this correspondence, as to what Dr. Wiley, Chief Chemist of the Agricultural Department at Washington, said right after Albert Heller, of the firm of Heller & Co., gave his testimony before the United States Food Commissioners, in Chicago, May 10th, 1899:

STATEMENT MADE BY DR. WILEY.

"You will remember I testified that I believe in innocent preservatives, that there were certain food products in which they were necessary, and that I believe, in a proper use and way, they were not injurious to health. On the contrary, I should favor the use of preservatives, and this is an excellent preservative for certain purposes, and as explained by Mr. Heller, I do not see how in the small quantity which he recommends, it could be injurious to health and doubtless is a good remedy."

It is not unworthy of notice that Mr. Moseley's position in this matter is characteristically misrepresented. He did not promise to handle "Freezine" if some government authority would endorse it, but specifically stipulated as follows:

"If you would submit a sample of Freezine to Prof. W. A. Henry, Director of the Agricultural Experiment Station, Madison, Wisconsin, and arrange with him to make an analysis of it and report on it, the writer would, if that report was fully favorable—so much so that Prof. Henry advised its use by dairymen and others who handled milk—endorse it in all the agricultural papers to which he contributed articles on dairy subjects. The writer also stated to your traveler that if Prof. Henry's report was unfavorable he would just as surely make the fact known through his letters to the agricultural press."

This misrepresention of Mr. Moseley's attitude is, however, comparatively venial when compared with the attempt to represent Dr. Wiley as endorsing "Freezine," if in fact he did not so endorse it. In order to ascertain the truth of the matter, immediately after Mr. Moseley furnished the DAIRYMAN with this correspondence, we sent the same to Prof. W. A. Henry, of the Wisconsin Experiment Station, with request that he write us what he thought of it. We were greatly shocked that the chief Chemist of the Agricultural Department should seemingly prostitute his high position to endorse for use in milk, what the best medical authorities pronounce to be a dangerous poison. Prof. Henry shared in the views of the DAIRYMAN in this respect and sent the correspondence to Hon. James Wilson, Secretary of Agriculture. In his communication to Mr. Wilson, he set forth the fact that the Dairy and Food Commissioner of Wisconsin was enforcing with vigor, the strict law in vogue against the use of all preservatives in milk and that it would prove hard work to maintain our law if the Department Chemist was quoted in support of such nefarious practice. To Prof. Henry's letter the Secretary of Agriculture made reply as will be seen in the two following letters:

(LETTER NO. 1.)

UNITED STATES DEP'T. OF AGRICULTURE,
OFFICE OF THE SECRETARY,
Washington, D. C.
August 26, 1899.

PROF. W. A. HENRY, Madison, Wis.—DEAR SIR:—Your letter of August 20th is a surprise to me. I am not ready to believe that Dr. Wiley has advocated anywhere, or at any time, the preservative Freezine, or any other, in the connection in which he is quoted. He is at present at Columbus, Ohio, and as soon as he returns I will send for him and put the matter before him. I desire to say, however, that if he endorses it, the Department does not. I agree with you entirely and sympathize with you in all your efforts along these lines. Whatever influence the Department has, will be used with the men who desire honest work. I will write you as soon as Dr. Wiley returns.

Very truly yours,
JAMES WILSON, Sec.

(LETTER NO. 2.)

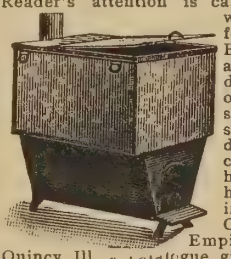
UNITED STATES DEP'T. OF AGRICULTURE,
OFFICE OF THE SECRETARY,
Washington, D. C.
August 28, 1899.

PROF. W. A. HENRY, DIRECTOR AGRL. EXPT. STA., Madison, Wis.—DEAR SIR:—I have shown your letter of the 20th inst. to Dr. Wiley, who makes the following statement:

"After I had given my testimony before Senator Mason's Committee on the subject of the use of preservatives, I was called on by a representative of the firm of B. Heller & Co., at my hotel, who said that my testimony in their opinion would greatly injure their trade. I replied that I had not mentioned their preservative by name, in so far as I knew, in my testimony, but understood that the substance which they sold under the name of "Freezine" was nothing but formaldehyde. I said that so far as I knew, it was not the intention of Senator Mason's committee to injure any legitimate business. The representative of the firm said that the quantity of formaldehyde used by them was extremely minute, I have forgotten now the exact amount, and I replied that I did not suppose that that quantity of formaldehyde would be injurious to a healthy stomach, but it should not be used unless properly labeled, so that the purchaser would know what it is.

The firm has no right to circulate such statements as it has. I did not endorse Freezine, or any other preservative, in any way, shape or form, and Mr. Heller would find no market probably for the sale of formaldehyde, under its own name. His use of my name as an indorser of formaldehyde is absolutely unauthorized, and I have already, more than two months ago, called attention to the fact that he was using my name without my sanction, and he promised at once to desist; otherwise, I said, legal steps should be taken to put a stop to it."

The above statements of Dr. Wiley, in connection with his testimony before the Committee, seem to me should be satisfactory to the health authorities of Wisconsin. His own attitude in regard to the use of preservatives is well known from his numerous publications and public addresses.



The Department will aid the medical authorities of Wisconsin in every possible way in controlling the use of preservatives and in compelling the proper labeling of food products which contain them.

Respectfully,
JAMES WILSON, Sec.

The above is a plain, unvarnished and representative statement of the reckless and misleading methods taken by formaldehyde and other preservative manufacturers to foist their compounds upon the milk trade. Deception and imposition are the inevitable concomitants of juggling and jockeying with human food. The man or woman who will put up milk to be taken for food in any form and will use such stuff in the same, deserves the most open public exposure and severest treatment the law can impose.

Farmers' Handy Feed Cooker.

Reader's attention is called to this device, which is sold at $12-50 for 50-gallon capacity. By feeding poultry and animals cooked food during winter, at least one-third of the feed is saved; also having stock in a healthy condition, preventing hog cholera among your hogs, and insuring the hens laying freely during the winter months. On application to the Empire Manufacturing Co., Quincy, Ill., a catalogue giving full description may be obtained. They are made in all sizes.

OUT OF RANGE.

The *Wisconsin Agriculturist* reprints from the Indianapolis *News* an article on what the latter paper is pleased to call the "Milk Belt" of the United States. The wild statement is made that of the milk solids the following proportions exist:

Butter fat, 3½ per cent; casein, 5 per cent; milk sugar, 5 per cent. There is a great deal of such wild assertions made by editors who know nothing of the subject on which they write. No such proportion of milk solids exists in cow's milk in this or any other country. No one ever saw natural milk with the butter fat less than the casein nor do we remember of any analysis that has yet been made in which the casein ran as high as 5 per cent.

Mr. Wheaton's Canadian Dairy Notes.

Cold Room for a Farm Dairy.—Pasteurized Milk for Cheesemaking.—Use of Calcium Chloride.—Fall Cheese Making.

ED. HOARD'S DAIRYMAN:—A dairyman in Eastern Ontario, who has made a success of his business, and who claims that his success has been almost entirely due to reading papers like the DAIRYMAN, containing the practical experiences of those engaged in the business, gives the following plan for a cheap and simple cold room for a farm dairy:

"First, a good, strong stone wall, sixteen feet square, and six feet high, on top of which are laid sleepers sufficiently strong to hold up fifty tons of ice. On top of these sleepers put a plank floor, covered with galvanized iron, soldered together, so that it will not leak, and allow the iron to come up on the sides, six or eight inches, forming a pan. Have the floor slant a couple of inches, and at the low side have a waste pipe, leading into the cold room below. Under this pipe, place a large barrel or vat, and you have it full of continually changing ice-water from spring to fall. This is very convenient for cooling cream, by having the cream in long, deep cans, and set into this water. The cellar or cold room, under the ice, maintains an even temperature the entire summer, and keeps the butter hard, and cream sweet as long as necessary.

"The storage-room for the ice, above the cellar, should be made twelve feet high, double boarded, and papered in and outside of the studding, thus forming an air space, which is very essential. The ice may be covered with sawdust in the usual way."

This seems to us like a very simple and cheap plan for constructing a cooling or cold room on an ordinary dairy farm. It could be constructed by any ordinary mason and carpenter, and combines an ice house and a cold room under one roof. If every dairyman had some such place for keeping his milk, cream or butter, during the warm weather, he would be considerable in pocket, and have greater satisfaction in carrying on his business.

The dairyman referred to carries on a milk and cream trade. Being near one of the larger eastern towns, he has built up a very extensive trade in pasteurized bottled milk and sweet cream He is a thorough believer in pasteurizing the milk or cream for buttermaking, and has achieved signal success in this line, having scored first prize on his pasteurized butter, wherever exhibited this fall. His sales of pasteurized milk have increased over two hundred and fifty per cent, during the past six months.

His system of pasteurizing milk is also simple, and we cannot describe it better than by giving his own words:

"We put the milk in a vat surrounded by a thin sheet of water into which a steam pipe is placed, connected with a steam syphon; allow the steam to run into the water, until the temperature of the milk reaches 156 degrees. We allow it to remain at that temperature for twenty minutes, and then cool by letting cold well water run around it for a couple of hours, which reduces the temperature to sixty degrees F., when the milk is bottled, crated, and placed in cold storage in connection with the dairy house."

Though the method of cooling the milk might be improved upon and made to cool the milk quicker and to a lower temperature, yet the plan seems to serve the purpose for which it is intended, and does very well when the milk is going into consumption in a comparatively short while.

Pasteurizing milk for cheese making has not been given much attention in this country. It is generally considered that the plan is not feasible in a cheese factory, where large quantities of milk are handled, and besides some authorities agree that pasteurizing milk renders it unsuitable for cheese making.

The Germans have been conducting some experiments along this line recently. Three series of experiments were made, including a large number of triais in each case. In the first series the separated milk was heated to 167 degrees for fifteen minutes; to 185 degrees for ten minutes. In the second series, and in the third series, to the boiling point for two minutes. In each experiment, about five gallons of separated milk were used, varying proportions of calcium chloride being added in some cases, and none in others.

In the first series, there was little difficulty in making cheese from the milk, either with or without the calcium chloride being added, but those conducting the experiment recommend adding to such milk about fifteen grains of calcium oxide (lime) per two and one-half gallons of milk, to facilitate the curdling.

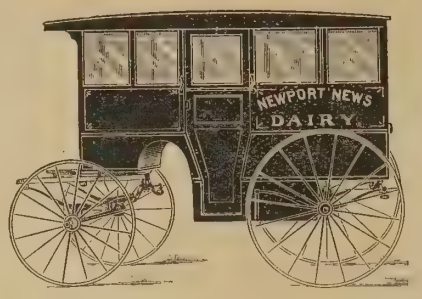
In the second series, the results were in many respects the same as in the first series. The cheese yield in each case was greater where the calcium chloride was used, than when not used. The green cheese also contained more water, but even on the basis of dry matter the yield was greater. The greatest difficulty from making cheese from this kind of milk was found to be the time required for the complete separation of the whey from the curd.

The use of the calcium chloride was also found to restore the ability of milk heated to boiling point to curdle, but to curdle it in the same time, two and one-half times as much calcium chloride was required as in the first series. The separation of the whey was very slow and difficult, and the curd itself was unusually rich in water, and was changed to a greyish white appearence and finely granulated condition, with very little tendency to adhere together. The addition of larger quantities of calcium chloride improved the adhesive qualities of the curd, although it did not entirely remove the difficulty.

In some later reports regarding the experiments, it is stated that all difficulties in making cheese from milk heated to 185° F., have been overcome, and that the process is rendered as simple as ordinary cheese making.

Further particulars in regard to these experiments will no doubt be eagerly looked for by dairymen in this country.

Should the process outlined above prove successful, it might be very helpful in some of our cheese factories in the dry weather, when bad flavors in the milk are rampant.



By heating the milk to 185°, all the germs causing the bad flavors would be destroyed, and by treating it as described and making cheese therefrom, a finely flavored product as any of the season should result. However, it might be well for some of our dairy experts to try the plan on whole milk before placing much confidence in its success. In Canada, where we make no skim milk cheese, any plan adapted to skim milk alone, would be practically useless.

Usually the cheese factories, with the exception of the larger ones, close at the end of October for the season. But it is more than likely that as many of them as can will run as far on in November as possible this season. This is always the case when the price of cheese is high in the fall of the year and the weather is at all favorable for making.

If the buildings are properly equipped and the curing rooms in shape for curing the cheese and maintaining an even temperature, the only drawback to making cheese later than this month, is the tendency of many patrons to feed turnips or turnip tops to their milking cows, thus causing bad flavors in the cheese. On this account, taking one season with another, it would be better for all concerned, if the cheese factories closed on October 31. Besides, many of our factories are yet far behind in the way of proper curing facilities, and it is risky for them to attempt to make cheese when the cold weather approaches. J. W. WHEATON.

Prof Connell astonished the audience by being able to declare from samples of the butter the exact food which the cows, from whence it came, had been eating. —*Houston Texas, Posts.*

We don't blame that audience for being astonished. Such an exhibition of butter reading would naturally phase any audience. But why stop at food? Why not go on and tell breed, color and length of horns? This opens up a new field in grading butter.

WE publish in full Mr. Axtell's communication concerning the general subject of judging dairy cattle at fairs, with some comments on the judging of Guernsey cattle at the late Wisconsin State Fair; but it must not be concluded that HOARD'S DAIRYMAN endorses his argument or conclusions, without several material reservations.

If Mr. Axtell knew Mr. Hill and Prof. Carlisle, as we know them, he would at once and forever acquit them of favoritism, deception or conspiracy, however much he might differ with them in judgment, or as to the principles which should govern in awarding premiums at a State Fair.

WISCONSIN DAIRYMEN'S ASSOCIATION.

The Executive Board of the Wisconsin Dairymen's Association will meet at Fort Atkinson, Wednesday, November 15th, to arrange for the next annual convention. Localities desiring to secure the meeting of the association should correspond at once with the secretary, Geo W. Burchard, Fort Atkinson, Wis.

THE SUMMER SILO.

We hope every reader of the DAIRYMAN who doubts the practical economy of building a summer silo will read attentively what John Gould, of Ohio, says in his "Note and Comment," on page 717 of the DAIRYMAN of October 20th. The experience of Mr. Williams which is recounted there ought to be enough to convince the most skeptical man in the world of value of ensilage in summer feeding. Let us repeat a little of what Mr. Gould says:

"With the drouth here, came an almost instant drying of the pastures, and the shrinkage of milk was remarkable. By July 1st, Mr. Williams commenced with a ration of twenty-five pounds a day, continuing it until July 13th. Before commencing to feed silage the shrinkage of milk was five per cent, but at the last date, the cows had not only overcome that, but had made a gain over normal of three and one-half per cent. For the next three weeks the ration was increased to thirty-three pounds, but so fierce was heat, flies and dry pastures, that the cows fell off 3 3 per cent. Then the ration was increased to fifty pounds of silage, and the gain overcame the shrinkage, and plus 2.7 per cent.

That statement of facts is more potent than an hour of the best preaching from this text that the DAIRYMAN can do.

Our Special Elgin Letter.

ED. HOARD'S DAIRYMAN:—But 3,600 pounds of butter were offered for sale on Monday's Elgin Board of Trade. Bids of 23½ cents were made, but were declined, and the call closed with no sales made. The Quotation Committee declared the market firm at 23½ cents. The total sales reported for the week were 546,000 ponnds. The sales for the corresponding week of the three preceding years were as following:

Oct. 31, '98, 10,080 lbs. butter sold at 22c.
Nov. 1, ,97, 9,120 lbs. butter sold at 23c.
Nov. 2, '96, 40,020 lbs. butter sold at 18@19c.

The New York market Monday was reported firm at 24 cents. H. C. B.

Elgin, Ill, Oct. 30th, 1899.

DAIRY MARKETS.

ELGIN, Ill., Oct. 30.—Sixty tubs offered; no sales. Committee reported market firm at 23½c.

CHICAGO, Ill., Oct. 30.—Butter—Creamery, extra, 23c; firsts, 19@20c; seconds, 15½@16½c; dairies, selections, 19c; No. 1, 16c; No. 2, 15c; extra ladle,14½@15c.

Eggs—City-candled, fresh, cases returned, 17c.

Cheese—Full cream, twins.new, good to choice, 11¾@12c: Young Americas, 12@12¼c: Swiss, 10@13c; Limburger, 10@11½c; Bricks, 10@12c.

Bran—In light request and prices steady at $12.25 per ton.

Cattle—There was no change in the cattle market. Trade was active, with exporters free buyers at $5.50@5.75. The top of the market was $6.10 for four loads averaging 1,361 lbs., with $6.35 the next highest The primest 1,400@1,600 lb. beeves would sell at $6.70@6.85. Most of the beef cattle sold at $5.20@6, averaging 1,030@1,540 lbs. Corn-fed Westerns sold at $4.30@6.10; bulk $5.50 @5 90; Kentucky steers, 1,222@1,282lbs., $5 55; grass Western steers, $4@4.90; Western cows and heifers, $3.30@4.25; Texas steers, 1,039 lbs., $4.10, and Texas cows, 712 lbs., $2.70; native canning stock, $2.25@3; fat cows and heifers, $3.24@5.10; bulls, $2.75@4.30; stags, $3 75@5.25; oxen $3.50@4.50; calves $5@7.50; and feeding cattle, $3.25@4.60.

MILWAUKEE, Wis., Oct. 30.—Butter—Creamery, fancy prints, per lb., 23½c; extras, 23½c; firsrs, 22@23c; seconds, 20@21c; imitations, 19@20c; dairy, selections, 18@20c: lines, 16@18c; ladles, 15@16c. Market unchanged, supplies being ample and sales moderate; receipts, 7,029 lbs.

Cheese—American full cream, October flats 11½@12c; July, August and September, 11@11½c; Brick, 11½@12c; Limburger, 11@11½c; Swiss, drum, 12½@13c; block, 12 ½@13c; No.2, 10½@11c. Market easy; receipts 7,890 lbs.

Eggs—Fresh, per doz., 16½c, loss off, cases returned. Market unchanged; receipts, 205 cases.

FOND DU LAC, Wis., Oct. 30.—Offerings, 3,000 Twins, and 515 Daisies; market very quiet, with few sales of Twins at 11¼c.

MUSCODA, Wis., Oct, 23.—Cheese—Offerings. 750 boxes Twins; car lots, 11½c; local lots,11c.

HILBERT. Wis., Oot. 21.—Cheese—The sales were 223 cases Young Americas at 11½c.

BRILLION, Wis., Oct. 20.—Cheese—Brillion market 350 boxes Young Americas at 11½c; 706 cases Twins at 11¼c; 1,700 boxes Daisies at 11¼c.

APPLETON, Wis., Oct. 19.—Cheese—The offerings to-day were 190 Cheddars and 359 Twins; 11¼c was bid, but passed and no sales.

BERLIN, Wis., Oct, 21.—Cheese—Offerings 213; no bids received. Owing to the decreased output of cheese, and the lack of interest it was decided to adjourn, subject to the call of the president and secretary.

HORTONVILLE, Wis., Oct, 19.—Cheese—The offerings were 135 Cheddars; 1,099 Twins: and 136 Daisies; 11 cents was offered on all lots, but only one lot of 40 boxes was sold. Market dull.

SHEYBOYGAN FALLS, Wis., Oct. 25—Fourteen factories offered 1,135 boxes of cheese to-day, and all except seventy-five boxes were sold as follows: 629 cases Young Americas at 11¾c; 147 Twins at 11⅝c; 30 Twins at 11½c; and 254 Daisies at 11¾c; market quiet.

MANITOWOC, Wis., Oct 25—Offers of cheese at dairy Board of Trade to-day were 650 boxes Daisies, 150 boxes Twins, 600 boxes Young Americas. All offerings were sold; Daisies at 11c; Young Americas at 11¾c; Twins at 11@11¼c.

PLYMOUTH, Wis., Oct. 24—Sales to-day 1,120. Twins at 11½c and 895 Americas at 11¾c; market firm.

NEW YORK, Oct. 30.—Butter—Creamery, Western extras, 24c; firsts, 21½@23c; state extras, 23¾@24c; firsts, 21½@23c.

Cheese—State, full cream, small colored or white fancy, 12¾c; large, 12c.

Eggs—State, Pennsylvania and Western, 21½@21c.

UTICA, N. Y., Oct. 26.—Cheese—Sales, 6,345 boxes large colored at 11½@12c; 780 boxes large white at 11½@12c; 1,250 boxes small colored at 12@12¼c; 900 boxes small white at 12@12¾c; 340 boxes small skims at 11¼@11½c.

BOONEVILLE, N. Y. Oct. 20—There were 1,218 boxes of large colored cheese and 240 boxes of large white offered, but as there were no buyers present there were no sales.

LITTLE FALLS, N Y. Oct. 23—Cheese—Sales 420 boxes large colored at 12c: 1,154 boxes small white at 11@12c; 970 boxes small colored at 11@12c; 355 boxes colored Twins at 12c; 1,074 boxes white Twins at 11 @ 12c.

BALTIMORE, Md., Oct, 30.—Butter—Market firm: creamery separator, extra, 25@26c; extra firsts, 24c; creamery firsts, 23c; creamery, imitation, extra, 19@20c; ladle, extra 17@18c; Western store-packed, 13½@14c.

Eggs—Market firm; strictly fresh stock 18½@19c.

PHILADELPHIA, Pa. Oct. 30—Butter—Solid-packed, separator creamery, extra 24c; creamery, firsts, 23c; seconds, 19@22c; imitation creamery, extra, 18c; firsts, 16c; seconds, 14c; ladle-packed, extra, 16c; firsts, 15c; seconds, 14c. Print butter—Creamery, extra, 25c; firsts, 24c; seconds, 19@22c.

Eggs—Pennsylvania and near-by, 21c; Western, 20@21c; Southwestern, 19c; Southern, 18c. Butter steady; eggs firm.

ST. LOUIS, Mo., Oct. 30—Butter—Firm; creamery, 19@24½; dairy, 15@20c.

Eggs—Steady: 15½c.

KANSAS CITY, Mo., Oct. 30—Butter—Creamery 19@22c: dairy, 18c.

Eggs—Fresh,14½c.

CINCINNATI, O, Oct. 30—Butter, 25c.

Eggs Firm; 16c.

Cheese—Good demand; good to prime Ohio flat, 12½c.

NEWARK, N. J Oct. 30—Market firm; for extra Elgins, 24c. Fair receipts.

WASHINGTON, D. C. Oct. 30—Market firm. Extras, 24½c; fine firsts, 23c.

BOSTON, Mass, Oct. 30—No change in butter, cheese or eggs from last week.

NEW ORLEANS, La. Oct. 30—Butter firm; 24 to 25c. Receipts small.

Latest quotations for fancy creamery: Buffalo, 24c; St. Paul, 22c; Minneapolis, 22@22½c; Detroit, 24c.

BALTIMORE MARKET.

BALTIMORE, Oct. 26—Butter—In sharp contrast with the condition of the market at New York, and other principal distributing points in the east, the most prominent feature here is the great scarcity of separator and gathered cream goods of the grades below extras, even firsts being none too plentiful. The greatest activity is observable among the buyers, both out of town and local, in their house to house explorations into everything that lies on the floors, or in the freezers, that can be hammered into something to satisfiy this craving for a quality, or qualities, worth from nineteen to twenty-one cents; and, as far as can be seen, it is poor hunting, the game not being worth the candle. Now, here is an object lesson for all shippers having a tendency toward other markets, where already, there is a congestion of these, to us very desirable grades—don't do it; don't send your products where they will only provoke unfavorable criticism at this time when this city is anxious for even the mottle and the light wasted varieties; with all of these imperfections there is a ready place for it now and at fair prices, and the chief reason is that this community prefers fresh made butter to that which has been stored. Store-packed and rolls continue in good demand for all grades.

Creamery Separator, extras, 24c; firsts, 22½@23c; seconds, 20@21c; Creamery, Gathered Cream, extras, 21@22c; firsts, 19½@20c: seconds, 19c; Creamery, Ohio, extras, 21@22c; firsts, 19½@20c; seconds, 19c; Creamery Imitation, firsts, 17@18c; seconds, 15½@16c; Iowa & N. W. Ladle, firsts, 16@17c; seconds, 15c; Ohio & Indiana Ladle, firsts, 16@17c; seconds, 15c; Ohio Rolls, firsts, 15@16c; seconds, 14c; W. Va Rolls, firsts, 15c; seconds, 14c; Ohio & W. Va. Store packed, firsts, 15c; seconds, 13@14; Creamery blocks (2lb). extras, 25½@26; firsts, 24@25; seconds, 22@23c; Creamery prints (½), extras, 25½@26: firsts 24@25c; seconds, 22@23c; Md., Va. & Penna. prints, extras, 21c; firsts, 20c; seconds; 18@19c.

Cheese—Receipts fair; demand good; market firm.

N. Y. State—Cheddars, fine, 12½@12¾c; choice, 12@12¼c; fair, 11¼@11¾c; Flats, fine, 13@13¼c; choice, 12½@12¾c; fair, 12@12¼c; Small, fine, 13¾@13¾c; choice, 13@13¼c; fair, 12¼@12¾c; Ohio—Flats, fine, 12¾@13c; choice, 12½@12¾c; fair, 11¾@12c; Ohio—Picnic, fine, 13@13½c; choice, 12½@12¾c; fair, 11¾@12¼c; Swiss Cheese, fine, 12@12½c; choice, 11½@11¾c; fair, 10½@11c.

Eggs—Under continued light recipts of choice fresh eggs, our market rules at 18 to 18¼c; there is a good demand for all fresh stock no matter what section they come from, just so they are fresh; mixed or held eggs will not fill the bill; please bear this in mind. Cold storage—All choice marks meet with ready sale.

301 Exchange Place G. M. LAMB & BRO.

WANTED—AGENTS FOR CREAM SEPARATORS

During the next six months—in conjunction with the introduction of the improved "NEW CENTURY" De Laval Cream Separators—we shall thoroughly reorganize our system of Dairy or "Baby" separator local agencies. Out of 2,000 existing agencies and sub-agencies 1,500 will be changed, and as many additional new ones created. 1900 promises to be the greatest of separator years. Centrifugal separation and clarification must soon become universal. Machines may be sold in every township. The conceded superiority of the "Alpha" De Laval machines should give them 85 per cent. of the total trade. But live aggressive agents are equally essential to getting it. We have the machines and require more good agents. Successful separator agents are confined to no particular class. Applications should give full details.

Mention This Paper In Writing.

THE DE LAVAL SEPARATOR CO.

Western Offices: RANDOLPH & CANAL STS. CHICAGO. | GENERAL OFFICES: 74 CORTLANDT STREET, NEW YORK. | Branch Offices: 1102 ARCH STREET, PHILADELPHIA.

READING NOTICES.

All Reading Notices under this head are at the rate of 25 cents per line.

For Sale—May Koffee's King Koffee, A. J. C. C. 44259. Best 3-year-old bull in New England. GEO. W. KNAPP, Stoneham, Mass.

Wanted—Position by young man as manager of dairy farm. Satisfaction guaranteed or no pay. Address "D," Box 558, Fort Atkinson, Wis.

Butter Maker wants position. Product guaranteed. References. Would lease. A. C. RAYMOND, Eagle Hotel, Lebanon, Pa.

Dairy Farm to Rent—Consists of 230 acres. 40 to 50 milch cows; completely furnished with improved machinery. Rent with or without milk route. Located inside school district of city of 9000. Liberal terms to right man. Must have A. 1. references. J. P. ANDREWS, Faribault, Minn.

To make your home happy—Use "Garland" Stoves and Ranges.

For Sale—Ten new milch, grade Guernsey cows RAY C. BICKNELL, Fort Atkinson, Wis.

If You Want to Know how to raise calves cheaply and successfully without milk, write to J. W. BARWELL, Waukegan, Ill. 38-13

For Sale—Tamworth boars. Also a good farm. Write at once. E. CLYDE HAMMOND, Cresco, Iowa.

Wanted—A competent and reliable workman on a small dairy farm. Must be a good milker. Permanent position to the right man. Address M. RUEBHAUSEN, Watertown, Wis

A Baby De Laval Separator No. 3, capacity 600 lbs. an hour, 30-gal. churn, butter worker, 6-bottle Babcock tester, shafting, pulleys, belts, etc. Price $100.00. Separator good as new and cost $200.00. E. R. BALSLEY, Troy, Wal. Co., Wis. 34-tf

For Sale—Three fine Guernsey bull calves, by SEBASTIAN HELLER, Calumetville, Wis. 35-tf

At Half Price.—Bull calf dropped August 15, 1898, out of Benjamina B. 63065, A. J. C. C. (18 lbs. 1 oz. butter in 7 days) by Ben Houghton 39476, A. J. C. C., out of Nuphar Houghton 36364, A. J. C. C., (15 lbs. 3 oz. in 7 days). Other blood lines equally good. First draft for seventy-five dollars secures this faultless youngster; solid color, full black points. BURCHARD FARM, Fort Atkinson, Wis.

Get in on the Ground Floor.—This applies to two classes of people. Those who are interested for the purpose of investment or speculation, and those who for any reason desire to change their business locations. To any person in either class the new towns located and owned by the Chicago & North-Western Railway Company along its new lines of railroad now being constructed, offer the most tempting inducements. Prices of lots in these towns are still absolutely on the ground floor, and are sure winners either for investors or locators. The North-Western also owns nearly one-half million acres of splendid timber land, adapted to general farming, which is for sale at very low prices. Write for information to J. F. Cleveland, Land Commissioner, Chicago & North-Western Railway Company, Chicago. 38-2

Improved Train Service Between Rockford and Watertown and Waukesha and Milwaukee, via the North-Western Line. By the addition of new trains on the above line, passengers can now leave Fort Atkinson at 8:42 a. m., arriving Watertown at 9:30 a. m., and Milwaukee at 10:45 a. m. respectively, and convenient service returning. Commodious day coaches. For particulars inquire of agents Chicago & North-Western R'y. 38-3

To Los Angeles and Southern California.—Every Friday night, at 10:35 p. m., a through Tourist Car for Los Angeles and Southern California, leaves the Chicago, Milwaukee & St. Paul Railway Union Passenger Station, Chicago, via Omaha, Colorado Springs and Salt Lake City, for all points in Colorado, Utah, Nevada and California. In addition to the regular Pullman porter, each car is accompanied by an intelligent, competent and courteous "courier," who will attend to the wants of passengers en route. This is an entirely new feature of tourist car service, and will be appreciated by families or by ladies traveling alone. Particular attention is paid to the care of children, who usually get weary on a long journey. These tourist cars are sleeping cars supplied with all the accessories necessary to make the journey comfortable and pleasant, and the berth rate (each berth will accommodate two persons) is only $6.00 from Chicago to California. Ask the nearest ticket agent for a tourist car folder, or address Geo. H. Heafford. General Pass. and Ticket Agent, Chicago, Ill. $7-sp

GLOSSARY.

The terms used in the above table and in the discussion of feeding problems in HOARD'S DAIRYMAN have the following significance:

RATION.—The total allowance of feed for twenty-four hours.

DRY MATTER.—That portion of a feeding stuff which remains after all the water or moisture has been expelled by heat.

DIGESTIBLE NUTRIENTS.—That portion of the dry matter which can be digested by the animal and does not pass off through the bowels as excrement.

PROTEIN.—That part of the digestible nutrients which goes to the formation of lean meat, ligaments, hair, horns and the casein (or curd) of milk. It is generally believed, also, that protein may be, and many times is, converted into the fat found in milk. The basis of protein is nitrogen, hence the protein elments are frequently termed the *nitrogenous* parts of the food. They are also called *albuminoids*.

CARBOHYDRATES.—That part of the digestible nutrients which is the primary source of sustaining animal heat and furnishing the energy for keeping the animal mechanism in operation. They are composed of the woody fibre of the plant and grain, and the starch, sugar, gums, etc., and in the published tables of chemical analyses, are usually subdivided into the terms *crude fibre*, which is the least digestible portion of feeding stuffs and *nitrogen-free extract*, so-called because it does not contain any nitrogen.

ETHER EXTRACT.—That portion of the digestible nutrients which may be dissolved out of the food stuffs by ether. It is frequently called *crude* fat. It can be used by the animal for maintaining the body temperature, and for this purpose is from 2.2 to 2.5 times more efficacious than the carbohydrates. It is maintained, by some, that the fat in the milk comes, largely, from the crude fat in the food, but it has been demonstrated that it is not absolutely necessary for this purpose.

FEEDING STANDARDS.

Various experiments have been conducted with a view to ascertain the amount of feed and the varying amounts or proportions of the several digestible nutrients required by domestic animals under the differing conditions in which they are placed. It is evident that a horse or an ox, at rest in a stall, requires less feed than when at work, and that a dry cow should not be fed in the same way that one would feed her when giving milk. The more work required of the horse, and the more milk yielded by a cow, the greater is the demand for feed. In the nature of the case there can be no exact and arbitrary standards laid down. What will suffice for one animal may be either too much or too little for another accomplishing the same work, owing to differences in adaptability, in digestive and assimilative powers and, in care and environment. It is well known that the well groomed and properly stabled horse requires less feed for the same work than the same horse left to shift for himself without grooming or shelter. It is equally true that the milch cow responds by larger results to good care and proper shelter.

It does not follow that the labors of investigators in seeking to establish standards for feeding, have been fruitless. On the contrary, the results already attained are most helpful if rightly used and varied from as circumstances may require. The following table is compiled from the conclusions reached by different experimenters, supplemented by personal experience and reports from readers of HOARD'S DAIRYMAN:

Animal.	Daily allowance for 1000 lbs. live weight. Dry Matter	Digestible Nutrients. Protein.	Carbohydrates.	Ether Extract. (Crude Fat.)
COWS.	Lbs.	Lbs.	Lbs.	Lbs.
At rest in stall	15 to 20	0.5 to 1.0	7.0 to 10.0	0.1 to 0.3
Giving milk	20 to 30	1.6 to 3.0	10.0 to 16.0	0.5 to 1.0
HORSES.				
Light work	15 to 20	1.5 to 2.0	9.0 to 10.0	0.4 to 0.6
Heavy work	26 to 30	2.5 to 3.0	13.0 to 15.0	0.8 to 1.0
YOUNG DAIRY STOCK. Age in months. / Av. live wt. per head, lbs.				
2–3 / 150	23	4.0	13.0	2.0
3–6 / 300	24	3.0	12.8	1.0
6–12 / 500	27	2.0	12.5	0.5
12–24 / 700	26	1 5 to 1.8	12.0 to 12.5	0.3 to 0.4

The food of support, or the simple maintenance ration, is the amount required to hold the animal at a uniform weight when no energy is expended in exercise or milk giving. The larger the animal, other conditions being equal, the greater the amount of feed required for this purpose; but the variation in this respect does not run parallel with the variation in weight. Thus a cow weighing 800 pounds will require more feed per hundred than one weighing 1000 pounds or 1500 pounds. Instead of deducting, for such an animal, one-fifth from the maintenance ration, as given above, it would be nearer right to deduct not more than one-sixth. Whatever is consumed beyond the requirement for maintenance, supplies the material for growth, for making milk or furnishing the power expended in work and exercise and combatting enemies and the elements. It follows that as conditions vary the standards should vary.

It should not be forgotten in compounding a ration that the stomachs of different classes of animals vary in relative size. The cow has very capacious receptacles for food, showing that she is fitted to consume relatively more coarse fodder than other animals, and hence, in arranging her feed, regard should be had both to bulk and the proper distribution of the nutrients throughout the entire mass. For example, 20 lbs. of timothy hay or 10 lbs. of corn will furnish practically equivalent amounts of nutriment, but the cow will not thrive on corn alone, because of the defective digestion, consequent upon failure properly to distend her stomachs and subdivide the concentrated food. Those of us who belong to the generation that went "through the war" remember that "roughage" was quite as essential as grain for the continued well being and endurance of the animals. The prescribed army ration for the horse contains practically an equal amount of roughage and grain; for the cow, under ordinary conditions, we think it best to have about two-thirds of the dry matter in roughage and one-third in grain. When feeding heavily for rapid increase of weight or extra flow of milk, this proportion cannot be maintained, but the roughage should not be materially decreased.

HOARD'S DAIRYMAN aims especially at giving the milk producer, the farmer who keeps cows, the very best and clearest scientific and practical information that can be obtained on the feeding question. It is always ready to answer any and all questions that it is able to on the many sides of dairy practice. For the trifling sum it costs, only $1.00 a year, less than 2 cents a week, it would seem no man who really values sound knowledge and who seeks the best profit can afford to be without it.

A RECENT trip through New York, by the senior editor of the DAIRYMAN, disclosed to him the very serious damage which has been done, to the dairy farmers in particular, by the severe drouth, which has prevailed all of the late summer. The corn crop in most localities is almost a complete failure, and the drying up of springs and streams compels farmers to haul water for their stock, in some cases several miles.

Years ago Horace Greeley warned the eastern farmers that if they cut off the timber from the tops of the hills they would greatly lessen the water supply. They paid but little, if any, attention to the warning, however, and now the dire effect of such wasteful action is seen. A few, very few, of the dairymen filled silos last year for summer use, and they report but little, if any, shrinkage in the milk flow, right through the drouth. The reduction in the production of milk has been very great and is being felt in the butter and cheese market.

The Butter Fat Contest at the Washington State Fair.

ED. HOARD'S DAIRYMAN:—In the butter fat contest there were two prizes, one for $50, and second prize $10; and there was a prize of a pair of Chester White pigs valued at $25, offered by Mr. Guy MacL. Richards for the pure bred cow making the most butter fat as shown by the Babcock test, in forty-eight hours.

In the first contest there were four entries. Mr. Guy MacL. Richards, of North Yakima, entered two Holstein cows and Mr. Mitchell Stevens, of Ellensburg, Manager of Elmwood farms, entered two Jersey cows, bred at Elmwood, but have lost registration. The score was as follows:

	Milk. Lbs.	Milk. Oz.	Per cent Fat.	Pounds Fat.
Jersey cow, 26.....	77	11	5 76	4.47
Jersey cow, Beatri e...	71	06	5.83	4.15
Holstein cow, Bessie..	80	04	3.50	2.80
Holstein cow, Chekotie	79	01	3.00	2.33

The Jersey cow won both first and second prizes. In the contest between pure bred cows, A. M. Stevens entered Galvina 97346, A. J. C. C. She yielded in forty-eight hours, 57 pounds, 10 ounces milk; test, 5.21 per cent fat, equal to three pounds fat. She ate six pounds of a mixture of bran, barley and oats, and one pound corn meal, twenty pounds carrots, and hay at will, daily. Holstein cows, as above, were also in this contest. Cow 26 ate eleven pounds of a mixture of mill feed and ground oats, twenty pounds carrots and hay at will, daily.

The Jersey cow, Beatrice, ate eight pounds oats and mill feed, equal parts; twenty pounds carrots and hay at will. The Elmwood cows won all three prizes. They were taken off the pasture, Wednesday, a week prior to test, taken to Ellensburg, kept over night, and from six o'clock in the morning next day, until nearly four p. m., kept in the stock yards and then shipped, and it was nine p. m. before they could be milked at the fair grounds; they went off badly on feed and milk. Beatrice ate nothing but a little hay and carrots for two days, and during the contest all the Jersey cows came in heat; yet, for food eaten, we think they did fairly well: 4.47 pounds, 4.15 pounds, and 3 pounds fat in forty-eight hours, for 11 pounds, 8 pounds and 7 pounds grain and bran makes cheap butter fat.

Ellensburg, Wash. A. M. STEVENS.

Injury to Fodder by Exposure.

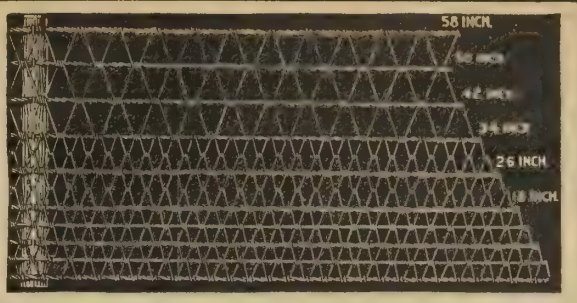
The unusually small hay crop of the present year has directed the attention of feeders to the most valuable of all agricultural side products of our state—corn fodder, more properly, the corn stover. The custom has been to leave most of this valuable feed standing in the field, and let stock take what they would of it, after it had been exposed to the frosts and storms. Experiments have repeatedly shown that well-cured corn stover is fully as valuable for feeding purposes as good timothy hay. This conclusion is the result of the practical feeding experiments carefully conducted.

The custom of allowing the fodder to stand in the field exposed to the weather, results in a two-fold loss; the feed becomes dry and unpalatable as compared with well-cured fodder, and there is also a great loss of material. This loss of material is both mechanical from the breaking up of the leaves, and chemical from the destruction of the constituents of the fodder. About one-half of the total feed in the fodder is found in the portion of the stalk, below the ear. Practically all of this and a portion of the stalk above the ear are lost if the fodder is left standing in the field.

The chemical losses, due to exposure, are chiefly losses of the group in which sugar and similar soluble bodies are found. These soluble substances are the ones most readily digested, and palatability of the food depends in a large degree on the proper preservation of these materials.

Cane growers know how rapidly canes deteriorate after a heavy frost or splitting freeze. Similar changes take place in the corn plant, which is related to the cane, but in a smaller degree, since the sugars are present in a smaller quantity. The changes that take place in weathering result in an absolute loss of material of the sugar group, since they are converted into compounds that pass off into the air. The albuminoids of the corn are more digestible than the albuminoids of hay. But weathering has the same effect on the corn plant as over ripeness in hay—the albuminoids are made less digestible, and so there is a loss of available albuminoids as well as an absolute loss from the decomposition that is steadily going on.

The hardening of the woody fiber incloses the other materials, so that greater resistance is offered to the action of the digestive fluids, and there is less food material available for the support of the animal.



The experience of good feeders, as well as feeding experiments carefully conducted under chemical control, indicate that the most feeding material may be derived from the corn crop by cutting it as early as is consistent with the proper curing of the ears. Danger of molding may be lessened by making the shocks smaller than is customary. Shocks as small as four hills square are sometimes used and permit very free circulation of the air. The labor of cutting and handling is considerably lessened by the use of smaller shocks.—*Dairy and Creamery*.

A lamp does not burn very well, and eats its head off in chimneys, unless you use the chimney made for it.

Judging Dairy Cattle.

ED. HOARD'S DAIRYMAN:—In justice to Mr. Philips as well as myself, I beg leave to answer certain statements and inferences given to your readers under head of "Judging Guernseys at Wisconsin State Fair."

To begin, I am the Ohio exhibitor referred to. I am not John Jones, nor do I know who the writer, signing himself John Jones, is.

I did state that one of the Philips cows was a "three teater" and that her udder was otherwise imperfect. It was plain to be seen that this cow's udder was badly unbalanced from some cause, which Mr. Philips admits, and assigns to milk fever.

I did also state that another of the Philips' cows was badly defective in fore udder, meaning tucked up, or weak as compared with her back udder, but I did not intend to state that her front quarters were extinct or even impaired, but rather that she did not possess a good development of fore udder. I further stated that I did not see how any competent and conscientious judge could award 1st, 2nd and 3rd prizes to cows of the type of the Philips' cows, being of the coarse, slab-sided, hard-keeping build, carrying the pendulant, inverted style of udders, when there were two tidy young cows in the ring, like Mr. Tratt's, having symmetrical shaped udders, well developed, front and back, and in almost fresh flow of milk.

I will further state that my criticisms were passed on the judging of the cows, and the defects referred to in the cows receiving the awards were pointed to as a reproach against the decisions rendered, rather than against Mr. Philips or his cows.

I am very glad that Mr. Philips' cows are not for sale, for in that case the comparisons will not be damaging to him.

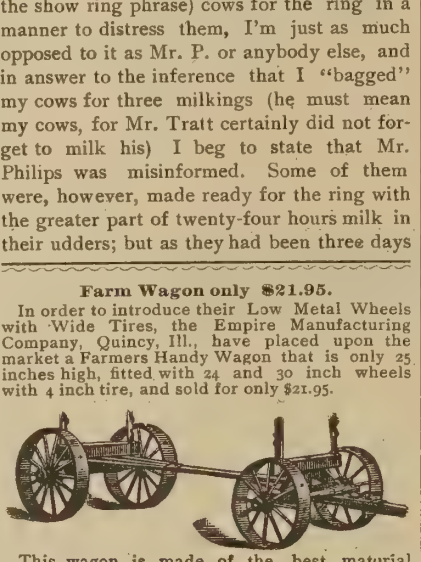
When Mr. Philips goes on to state under what conditions he took his cattle from the field and placed them before the public, on exhibition, he would seem to me to be defending himself against a charge that no one who saw them would, for a moment, think of preferring, namely: That he especially fitted them for the show ring.

Should he ever venture outside the circle controlled by his friends, with cattle in the condition his were exhibited at Milwaukee, he will have a chance to learn something himself, while he is teaching the other fellows.

But I have great confidence in Mr. Philips' ability to keep up with the procession, for Tuesday morning, while my men and myself, preparatory to showing, were engaged in combing out the tails of our cattle, that we had washed and braided up carefully the night before, were polishing their horns and smoothing down their coats that they might look as tidy as a bride on her wedding day, I saw Mr. Philips doing work on the brushes of some of his cattle with his jack knife, that would have bid defiance to any comb. The dung balls and burrs came out and plenty of hair too. I think this must be the trick referred to by the Editor, in his answer to John Jones as "plucked tails," at least it was one I never saw practiced on any fair grounds before.

Now friends and critics, what do you go to fairs to see? The mature fruit, the finished article of handiwork, the perfected machine is it not? You expect to see the best in every department that can be produced, and you like to see each exhibit in the pink of condition, do you not?

If an exhibitor of carriages brought a vehicle covered with mud, its trimmings faded with sun and rain, a few spokes out of the wheels, the whole outfit bespeaking that 'twas wrecked and worn out, but withal had been constructed of pretty good material to start with, and you were to judge it along with others, would you give it a premium over a new and bright and clean vehicle of the same pattern, equally well constructed of just as good material? Or if a horse had only three legs, or possessing four, was very lame on one of them, the muscles shrunken and the cords shortened, until he could scarcely get his foot to the ground, would you consider him worthy of a prize, as a carriage horse, against a horse with four good legs and equally as good in every other way? Would you consider him worthy if there wasn't another horse in the ring?



Well, if you would require a perfect vehicle, bright and clean, a sound horse well groomed, wouldn't you at least *prefer* a sound cow, shown at her best?

Blanketing and housing cattle, together with plenty of grooming to make the hair look bright and slick, I consider perfectly legitimate and commendable. The effect pleases the people who pay to see the show; it never disgusts them; they never criticise, but always praise their glossy coats; while those showing rough coats, faded hair, and well recognized evidences of neglect are made the butt of everybody's jokes. Clipping the tails above the brush, we have sometimes practiced, don't know that it does any harm, and am sure it does no good, except as it adds to the general appearance of tidiness, which exhibitors, as a rule, like to produce, to please the people, and help to make a pretty show—just as we polish the horns, and all the pay we get for it is, that we hear the ladies occasionally exclaim: "Oh, what beautiful horns!" These minor points have very little to do with fixing the opinion of the judges, and no exhibitor puts much reliance on the show ring polish to win; but I consider it quite as appropriate that the show cattle be brought out fitted, if you please, for the show ring, as that their owners should go well and neatly dressed to church, or to a ball.

When it comes to "bagging up" (pardon the show ring phrase) cows for the ring in a manner to distress them, I'm just as much opposed to it as Mr. P. or anybody else, and in answer to the inference that I "bagged" my cows for three milkings (he must mean my cows, for Mr. Tratt certainly did not forget to milk his) I beg to state that Mr. Philips was misinformed. Some of them were, however, made ready for the ring with the greater part of twenty-four hours milk in their udders; but as they had been three days

Farm Wagon only $21.95.

In order to introduce their Low Metal Wheels with Wide Tires, the Empire Manufacturing Company, Quincy, Ill., have placed upon the market a Farmers Handy Wagon that is only 25 inches high, fitted with 24 and 30 inch wheels with 4 inch tire, and sold for only $21.95.

This wagon is made of the best material throughout, and really costs but a trifle more than a set of new wheels, and fully guaranteed for one year. Catalogue giving a full description will be mailed upon application by the Empire Manufacturing Co., Quincy, Ill., who also will furnish metal wheels at low prices made any size and width of tire to fit any axle.

Marquilla's Major 40804.

Closing Out Sale **Of CHARTER OAK HERD!**

180 Head, pure St. Lamberts.
High per cent ST. LAMBERTS and TORMENTORS,
Oct. 25th and 26th, at Pomeroy, Ohio.

Have sold my lands and must sell my cattle. Send for catalogue.
J. P. BRADBURY. Pomeroy, Ohio

on the cars, and the last thirty-six hours without water, and were unloaded late Monday, and ordered into the show ring early Tuesday morning, the amount of milk they had in their udders was not distressing to them; and I will add right here that Mr. P. could have, without objection on my part, and it is my opinion, without distress to them, have "bagged" his cows for twice three milkings. But you have perhaps noticed that pendulous udders of the bell clapper style don't improve in appearance much, by "bagging." Mr. Tratt's cows would have shown better, and should have been shown with moderately full udders.

I maintain that all dairy cows should be shown with well filled udders, and if they are not secreting enough milk to fill their udders, or when filled are badly carried, being pounded from one side to the other with every step they take, that it does and should place them at a serious disadvantage before a judge. The true shape of the udder cannot be determined unless well filled; moreover, a blind quarter or a weak one is easier balanced up with a little milk in them, than when filled tight.

I also claim that a fresh cow is entitled to preference over a dry cow—always supposing them nearly equal in other respects, for numerous reasons. She makes a better show. This pleases the people who came to see the show. It takes planning and patience, sometimes accompanied by repeated disappointment, to finally bring her out in the pink of condition, in her full bloom, at a time, as we may say, when we have before us the "proof of the pudding". Is not this effort on the part of the exhibitor, commendable and worthy of reward? Has a judge a right to presume, that some other cow, after she has recovered the use of her impaired functions, and has again freshened, having run the gauntlet of milk fever and all the other ails that are liable to beset her in meantime, will then be just as good a cow, and perhaps a little better than the one that stands before him already rounded out to the highest degree of cow excellence.

As for the other tricks that Mr. P. refers to, as greasing the ears, and injecting the udders, one of them seems to have reacted very forcibly on the man that was probably the first exhibitor to attempt it. The other, greasing ears, I never heard of. Coloring the natural wax in the ear, has, I am told been resorted to, and I know of one case where a certain cow was said to have been defeated on account of too much artificial coloring material used on her udder. Deceptions of this sort are readily detected by a keen judge and should have an effect on him the reverse of favorable.

I did not show my cows at Milwaukee. I received a little foretaste of what I believed would happen on females, by what did happen before Prof. Carlisle had finished the bulls.

When I learned that the yearling bull awarded first prize, belonging to Mr. Hill had been bred by Mr. Philips, and saw how near alike in type Mr. Philips' cattle were, and had just myself received first prize on my two-year-old bull, a bull of very similar type to Hill's, that I considered the poorest individual of the seventeen head I had with me, against two bulls that were his superiors, I declined to lead out any more of my cattle.

Mr. Hill since assured me, in a letter, that I made a mistake, that he believed I would have at least received first and second on aged cows.

Very likely Mr. Hill, being Ass't. Superintendent, knew, but if that is the case, what puzzles me is, why didn't Mr. Tratt get something on his cows that were young and sound and fresh, and very much nearer the type of my best cows than Philips' were.

Now I don't think Mr. Hill really expected me to get first and second on cows; I think he just wanted to make me feel bad by telling me what I had missed, and expected the prizes to go where they would help boom the bull he had chosen to head his herd.

With the permission of HOARD'S DAIRYMAN, I will have published in their valued paper, in the near future, pictures of several representatives of this Ohio herd of Guernseys, whose owner took so radical a step at the Wisconsin State Fair.

The cuts shown will be exact reproductions of photographs, taken within the last few months, without the least alteration or exaggeration. L. V. AXTELL.

Hoard's Dairyman in Florida.

Following its Teachings Brings Success.

ED. HOARD'S DAIRYMAN:—I count on the weekly visits of the DAIRYMAN, and have always found it an A-1 adviser,—so many things appear in its columns that are worth to me many times the amount of the subscription.

One year and eight months ago, I located here and had no actual experience in dairying; started with two cows, grade Jerseys, and have added to my herd some very good dairy cows, and recently secured a full blooded Jersey bull, a descendent of Adelaide St. Lambert, and am anticipating a number one herd in a few years. Am now raising seventeen heifer calves, part sired by this bull. Commenced making butter for the local trade about one year ago,—knew nothing about handling cream or butter, but by close study of articles in your valuable paper, I have succeeded in producing an article that finds a demand far in excess of my supply, and I am greatly encouraged.

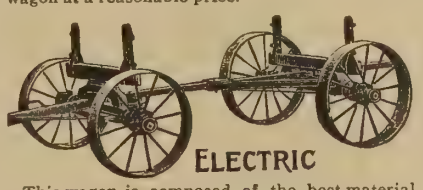
I wish to thank you for your helpful replies to my inquiries, both direct and through replies made to others which fit my case

I wish you the increased success, which you so deservingly merit. "CRACKER."

Jefferson Co., Florida.

Feeding Oil Meal to Young Calves.

W. E. T., Rush Lake, Wis., writes: "I wish to inquire concerning feeding oil meal to young calves. Is it good for them, and if so, should it be cooked or fed raw? How much should be given a calf when two weeks old, and how much later on?



For very young calves it is better to scald the oil meal with water, in order to form a jelly. Some of this jelly or pudding can be placed in a pail of milk. The calf will find it as it drains the vessel, and show his appreciation by devouring it greedily as soon as he has learned its taste. At first a few teaspoonsful of the meal a day is sufficient. When a little older the meal need not be cooked, but fed either with the milk or other grain, as oats or bran in the trough. As oil meal is relatively expensive in Wisconsin, the feeder should not use a large quantity of it. A handful for a young calf and a double handful for an animal three or four months old, will be helpful, and the remainder of the grain ration can consist of oats, bran, with a little corn meal if a dairy calf, and a considerable quantity of corn meal if the animal is designed for beef.

Oil meal is one of the best of feeding stuffs for limited use with all kinds of farm animals, and stockmen should have it on hand at all times. Its effects upon the bowels are the very best, and animals receiving it show its worth in the loose, flexible hide, silky hair, and the general appearance of thrift. W. A. HENRY.

Wisconsin Agricultural Experiment Station.

Farm Wagon Economy.

The economy of this proposition is not all found in the very reasonable price of the wagon itself, but in the great amount of labor it will save, and its great durability. The Electric Wheel Co., who make this Electric Handy Wagon and the now famous Electric Wheels, have solved the problem of a successful and durable low down wagon at a reasonable price.

ELECTRIC

This wagon is composed of the best material throughout—white hickory axles, steel wheels, steel hounds, etc. Guaranteed to carry 4000 lbs.

These Electric Steel Wheels are made to fit any wagon, and make practically a new wagon out of the old one. They can be had in any height desired and any width of tire up to 8 inches. With an extra set of these wheels a farmer can interchange them with his regular wheels and have a high or low down wagon at will. Write for catalogue of the full "Electric Line" to Electric Wheel Co., Box 130, Quincy, Ill.

THE UNITED STATES TRIPLE CURRENT SEPARATOR

Has proven time and again in competition with other separators that it

AVERAGES TO DO MORE THOROUGH SEPARATION WITH LESS COST FOR REPAIRS.

It does not need to be bolstered up by tricks to make a record. Read the following:

Skims Over Rated Capacity and Cleaner than the De Laval.

CROWN POINT, N. Y., July 18, 1899.

Our creamery started five years ago and during that time we have used three different kinds of cream separators. This spring we needed new separators and about three months ago, a DeLaval Alpha Disc Separator was put in our factory and two weeks later an Improved U. S. Both separators were the $500 size.

After thirty days' tests we purchased the United States because it showed a greater capacity and averaged to separate more thoroughly. It has exceeded its capacity and shown an average test of skimmed milk up to date of .032 of one per cent.

My personal experience in skimming milk is of two years' close attention. My experience handling and making machinery has been of thirty-four years consecutive duration. In my judgment, to give a candid and unbiased opinion, the Improved U. S. Separator, regarding its construction, capacity, simplicity, even and clean skimming, and power required, excels all that came under my notice in making a selection.

W. S. GREEN, Manager and Treas.
Farmers' Creamery, Cheese & Produce Co.

The U. S. Displaces a Sharples' Tubular.

EAST SPRINGFIELD, N. Y., June 26, 1899.

This is to certify that we, the undersigned, have placed in our factory here a No. 0 U. S. belt Separator and we are satisfied and pleased with it. We have run through it over 3,000 lbs. of milk per hour for three solid hours, and it skimmed down to less than .05.

We have been trying to use a No. 25 Tubular machine, but it has given us an endless lot of trouble and we cannot possibly, neither can P. M. Sharples' experts, make it skim clean, even when the cream is very thin. We do not care for any more Tubular Separators, the old reliable U. S. is good enough for us.

ISIAH COOK, President.
CHAS. A. GRANT, Buttermaker.

The U. S. Gives No Trouble.

ST. REGIS CREAMERY,
ST. REGIS FALLS, N. Y., June 29, 1899.

The U. S. Separator No. 0, bought of you this spring is giving entire satisfaction. The production for the month of May was 1 lb. of butter from 22⅛ lbs. of milk, which is better than any of my neighbors that I have heard from. The machine has never given any trouble and it does not seem likely that it ever will. WM. T. O'NEIL.

The U. S. the Best All Round Machine.

WAUKEE, IOWA, Oct. 17th, 1899.

I have run a United States Separator since Jan. 19, 1899, and have had unusually good success with it; have been skimming right along as close as one twentieth (.05) of one per cent. They are easy to run and simple in construction. They do not cut the cream as other machines do.

We are using two Alphas and one Springer at the other two creameries and I think the U. S. the best all round machine we have.

I can make any U. S. skim to a small fraction of one per cent. We test all our separators every day. A. L. ROSENBERG.

We furnish everything necessary for a complete Dairy or Creamery outfit.

Comments and Queries From Robinswood Farm.

The Selection of the Dairy Cow In Relation to Protein Feeding.—Her Evolution Consequent Upon Practical Conditions.—Liquified Air as a Milk Preservative.—The Nature of the Feed More Important than Breed.

ED. HOARD'S DAIRYMAN:—I know all of my neighbors are wide awake to see how much of a fool I can make of myself as a farmer. I have already made quite a number of essays in one way or other. Some of them have been fool things to do, but my neighbors will bear me out that none of the unsuccessful essays have been large ones. I having always kept one foot on dry land, and have always been able to pull out the foot from the "marshy" spot without getting bogged. So, as in other things, I am going slow in my selection of the dairy cow I want to raise, and recommend to the farmers who patronize Gilmanton's Creamery. Nevertheless, I am beginning to arrive at some pretty definite conclusions in the matter—getting "warm" as it were. I have concluded not to expect a cow that will perfectly fit the case. There is no more reason why one should expect perfection in a dairy cow, than in anything else. I know enough now of the hopelessness of getting what we want by crossing breeds. I can plainly see, that in the long run, the practice is one of degeneration. It is bad enough to make progress by keeping to one established breed. I do not believe that anyone of the established breeds is the all-round breed for the average American farmer. Nor will one kind of a cow be the best for all of the farmers of such an immense territory as exists on this North American continent, with the various diverse conditions pertaining to its many sections.

I believe that each section must start with the established breed best adapted to the special local requirements, and then by selection and intelligent breeding gradually evolve the kind of a cow desired. I believe, that in a general way, that cow will be more of a dual-purpose cow than the specialized Jersey now is. (The dual-purpose cow is worse than the ghost; it "will not down.") I think there is a reason for its constant appearance. It would not seem so terrible if this custom were spoken of as the dual-purpose dairy cow, and make a marked distinction between her and the combination beef and milk cow. No dairyman wants the latter.

The first requirement of a dairy cow is, that she shall give a big lot of milk. It also ought to be known, that in this age of specialism if a man is to succeed, he must have a special and definite aim, and stick to what he is aiming at. There is no question in my mind that, over a large area in our country, it will pay farmers best to make their aim veal and beef; and let the milk products be a secondary matter. But if a man is going to make two-year-old beef his aim, he has got to plan very differently, than if high-grade butter is his goal. If he is going to succeed, he has got to have stock whose strong tendency and ability is to grow muscular tissue quickly, and in abundance. He has got to have an easily tillable soil, and grow great corn crops. He has got to have rich pastures, above all things. His young stock has got to be kept "sappy," and growing all the time; and, withal, he need not bother himself about protein crops and feeds.

But there are lots of farmers who are not situated favorably for the carrying out of such requirements. Our Gilmanton farmers are of this sort, and we could never compete with other sections, if we aimed for beef and veal as a principal product. Our local conditions are favorable for the production of fine milk and butter. Most of our farmers are situated so far from shipping stations, as to make the hauling of milk for city use too onerous a matter. Even under present conditions of competition, it would be perfectly out of the question.

When the milkmen of the country get to using liquified air as a means of preserving their milk, it will then be very simple to aerate milk by pouring into the milk can a little fluid air, which would freeze up the milk solid, and thus enable it to be transported hundreds of miles, and keep perfectly so long as it remains frozen. This possibility puts very far distant cities within practical reach of farmers who may be located close to railroad shipping stations. When this practice is generally adopted, there will be less money in the selling of whole milk than at present, although it will also largely increase the consumption of milk in cities, on shipboard, etc. This outlook is one reason why we Gilmanton farmers should stick to our aim of high-grade butter. We can make it; our creamery product took first prize at the Rochester Fair this fall, the judging being by one of the most competent experts in this country.

We have a climate which, practically, leaves out the hot summers of lower altitudes and more southerly latitudes. This means a cool temperature in which to transport our milk to the separators, and our butter to shipping stations. It means that we maintain permanent pastures of the best grasses. We have fine water and pure air. Our region grows very healthful cattle, as well as vigorous men.

We have our central creamery, and a number of outlying skimming stations. It yet remains to use a pure culture starter, to be certain of the highest excellence in the product every time, and then to advertise our claims for patronage, in order to place every pound of butter we can make at a very considerable advance over general market rates. In the matter of high-grade butter, we can compete with the world; alas! it is the only thing in which we can compete with the world. Hence, there must be no mistakes in the policy for advancement that we make.

I don't know that it would make much difference as to which of these breeds we should start with—Ayrshires, Jerseys, or Guernseys. It would amount to pretty much the same results in the end. It would be a cow, evolved as to her performance in somewhat strict accord with the nature of the feed that will prove practical to produce in the most economical manner. The growing and feeding of protein feeds must be aimed for. If it shall prove practical to feed our cows on a narrow ration with a full proportion of protein, our future cow will be a specialized milk machine, but if the ration is to have a disproportion of carbohydrates, she will become more of the dual-purpose dairy cow—a creature with a larger frame, on which the excess of carbohydrates in the food can be deposited as occasion requires. The fact that we will have to utilize our extended but poor pastures will tend to develop her muscular system, and make of her a larger cow than one that is soiled, or otherwise nourished without so much exercise.

It must be accepted as a fact that too much exercise tends to decrease the flow of blood and nerve impulse to the milk manufacturing apparatus. The more protein we can feed, the more milk we can produce. I don't suppose there is any danger of feeding too much protein under present conditions. I am experimenting again with feeding bought proteins, such as gluten and cotton-seed meal. I do not have much faith as to the practical outcome in profit, but I want to give it a more fair and severe trial than I did last winter. I am also preparing to grow a va-

riety of protein crops next year: Crimson clover, grown as an annual, Canadian peas with oats, soy beans; grow bush beans, horse beans and cow peas.

There does not seem to be any doubt but that we can produce a better balanced ration of rough feeds than we now grow. We can also do something in growing concentrates. Our oat crop we can let get ripe, and thresh out the grain; the same pertains to the field peas, and to the early maturing bush beans. There is one advantage in ripening some of these cow feed crops and threshing them, in that, if cured as hay, the mice are apt to get in through the mow, and greatly injure the quality of the feed.

Whether it is going to pay to grow these special protein feeds, remains to be seen. It certainly does not seem worth while to stuff the cow with more carbohydrates than she can make use of, as the quantity of milk is determined by the amount of protein present. It were probably better to separate the rough parts of the carbohydrates, and use them for bedding litter, and for absorbents. This will tell in the saving of manure, and in benefiting its quality.

Part of the corn crop might go in the silo, and part be allowed to ripen the grain, and thus concentrate most of the protein of the plant into the grain. In view of the desirability of introducing as large a portion of protein as possible, it seems as though the old style of ripening the ear in the stalk might not be so bad a plan. Part of the stover—the leaves and tops—could be fed, and the rejected butts be shredded for bedding or for hay for store stock, where quick growth, and daily product of milk is not to be provided for.

It seems as if the disproportion of carbohydrates such as is found in timothy hay, corn butts, etc., might not only be fed to bulls, steers and horses at rest, but also be used for bridging over drouths in the summer, during which periods most of the better dairymen's herd should be more or less dry; hence in no present need of a large protein content in the food supply. Here are a lot of practical problems which we will have to work out to a determination. In the meantime no mistake would be made in commencing to grade up the herd with a thoroughbred bull of the three breeds mentioned.

In our cold country, I think it would be a mistake for the ordinary farmer to commence with thorough-blood females. If a man is to become a breeder of thoroughbred dairy cattle, that is one thing; but I believe that the practice of the stock breeder should be very different, from that of the general purpose farmer or dairyman. By starting with dams already adjusted to the peculiar conditions of the farmers' environment, his new blood would be gradually and harmlessly infused through the herd, and become adjusted to the peculiarities of the environment and special conditions of feed, more advantageously than if full blood females were introduced.

This reasoning would not pertain if full bloods were to be obtained fully acclimatized and used to local practices in feeding. But it seems as if the breeder of thoroughbreds in order to maintain milk giving tendencies, should often feed in a more expensive manner than would be profitable for the general farmer and the dairyman. Specialism must pertain in this as in other things. The breeder gets his profit from stock possessing certain valuable tendencies. The farmer gets his by great economies in the production of his milk and butter products. No matter if the farmer is not able to balance his rations in protein or to give a highly concentrated feed, he ought to have a herd that has the capacity to make the best use of what he does grow or feed.

But if he cannot grow a good quantity of protein, there does not seem to be much use of having cows with highly developed milking apparatus. The cow wanted, depends largely upon the amount of protein in the food provided. J. W. KITCHEN, M. D.

New Hampshire.

Second-Growth Sorghum Causing Death of Cattle.

The reports which have been made from time to time concerning the results of feeding second-growth sorghum, have been utterly irreconcilable. For every instance where one farmer has reported the loss of animals following the use of second-growth sorghum, another, and perhaps two or three, will report the use of such fodder for years in succession with out any ill effects.

Hitherto, there has been no satisfactory explanation of these discrepancies, but the instances related below appear to solve the problem satisfactorily.

Every season there is complaint of loss of cattle from eating second-growth sorghum and similar foods, and the question is asked as to whether such foods are poisonous. Although death frequently follows when cattle are permitted to fill themselves on second-growth sorghum, it should not be understood that the food contains a poisonous substance, as the following will make clear: The Sanitary Dairy Co., of this city, recently lost 17 cows and Chief Sanitary Officer Francis sent the veterinarian of the Health Department, Dr. Ellis, to investigate the case, as it was feared by many that some contagious disease had broken out or that death was due to poison and that all the herd would be more or less affected, thus vitiating the milk supply. Dr Ellis found, however, that the cows had broken into an adjoining field and gorged themselves with second-growth sorghum which by fermentation in the stomach developed gas to an extent sufficient to burst the paunch and thus cause death.

Sedalia, Mo., Oct. 13.—T. L. Scott, a Kemp, Mo., stockman, turned a bunch of cattle yesterday into a sorgum-cane patch. Inside of an hour four of the animals died and many of the others were taken sick. A post-mortem examination of the dead cattle disclosed that death was caused by over gorging of their stomachs with green cane fodder, causing gas to fill their paunches to the bursting point,

Such cases, as every farmer knows, are readily relieved by thrusting a trochar into the paunch at the point of greatest distention, which will be just forward of the left flank and not far from the back bone, then withdrawing leaving the canula as a tube through which the gas may escape. If a trochar is not at hand the large blade of a pocket knife and a goose quill may be made to answer, thrusting the knife through the hide and linings of the paunch, then placing the quill in the incision and thus affording an escape for the accumulated gas.—*Rural World*, of St Louis.

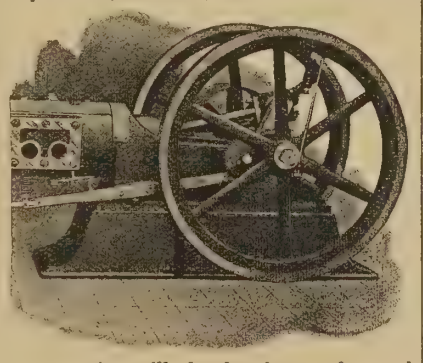

ILLUSTRATION.

The accompanying cut illustrates a gasoline engine, made by the Davis Gasoline Engine Works, of Waterloo, Iowa. They have the following to say of the engine:

"There are no small springs or light intricate parts in the construction of the Davis engine. Anyone can run it without the least difficulty.

It is assurance against danger from any source—explosions or otherwise. The supply tank (whether gasoline or other fuel)is always placed lower than the engine, and is buried under ground when desired. The feed chamber is provided with an overflow pipe which returns all surplus oil to the supply tank. The Davis positively pumps the oil from the tank.

The Davis Engine is reliable because it is simple; it is reliable because it is built of the very best of material; it is reliable because

every engine will develop its rated actual horse power, and will continue to pull its full load as long as required. It works as well in cold as in warm weather.

This engine is most emphatically a high grade engine, and is most mechanical in construction. The forged steel connecting-rod is turned and polished; the boxes are genuine aluminum bronze.

Buyers of high class engines should demand that the main bearings are fitted with quarter boxes. With these boxes the wear is always completely taken up, and insures perfect alignment and a steady, even running machine, free from pound or jar, that is so common with the ordinary cap box.

For further information address manufacturers.

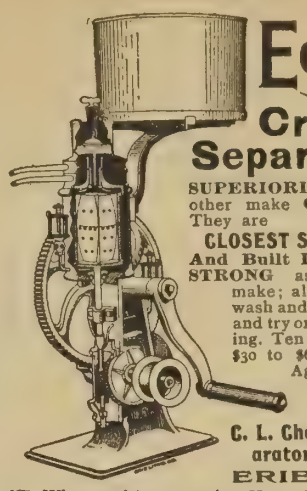
Prepare for Winter.

Now is the time to think about keeping your stock warm during the coming winter. Before cold weather sets in look over your out buildings and see if there are any leaky roofs, any shingles or clapboards coming off, or any cracks that need stopping up to make the buildings warm.

It is poor economy to have cows and horses sleep cold in the winter, and every farmer knows how much more profiable hens are, and how much faster the chickens grow if they are kept warm.

If you will accept a suggestion from us, of which the editor of this paper will approve, you can fix up your old outbuildings, prevent leaky roofs, make warm your sheds, barns, hen houses, hot beds or green houses at very little expense.

Go to your nearest hardware dealer and get a roll of **Neponset Red Rope Roofing**, which is made for any outside covering, and is



postively water-proof, wind-proof, and frost-proof. There are five hundred square feet in each roll, and it will only cost you $5.00 including the necessary nails and tin caps.

Don't confound **Neponset Roofing** with common tar paper, which, when exposed to the weather will crack, crumble and quickly rot away.

Tar paper was all right for your grandfathers, but in this age of advancement a covering which is very much more durable and economical is required, and that is **Neponset.** It takes the place of shingles or clapboards on outhouses, and back-plaster in dwellings. Any one can put it on and it will last for years.

If you would like to have a sample of this Roofing and full particulars before you buy, send a postal card to **F. W. Bird & Son, East Walpole, Mass.,** and they will send it to you by return mail free.

Keeping Farm Accounts.

ED. HOARD'S DAIRYMAN:—Answering Mr. C. D. Rust, of Brooklyn, N. Y., in regard to a simple accurate system of keeping farm accounts, I send herewith a copy of some of the accounts in my ledger.

For myself, I use regular double entry, and keep journal, cash-book and ledger, besides a small pocket day-book in which I make the entry of all my transactions just when they occur, thus avoiding any chance of error by lack of memory. Would suggest that any one using a pocket day-book be very particular about all that goes into it, for in case of any legal dispute the book of original entry will be the one that must be considered.

Friend Rust can open other accounts, such as a "General and Sundry Expense Account" into which he can throw all sundry items of expense as they occur; "A Living Expense Account" into which can be charged everything that is required for the living of the family; a personal account into which charge all cash and other things used by himself. Other accounts may be opened as necessary, and at the end of the year, or sooner if necessary, he should open a "General Ranch Account" into which he should close all other accounts which pertain to the expenses and produce of the farm, and then he can see just what the profits are, and he then has everything in a very accurate and compact form. A ledger of about 400 pages, which can be bought at any stationery store for about $1.75, is just about the thing for a farm ledger.

He will see by referring to the sample accounts, which are exact copies from my ledger, that the expenses, such as seed, etc., are charged up in the left hand column, while any produce sold is credited in the right hand column.

In regard to the "Living Expense Account," whenever charge is made for anything taken from the ranch for use, a credit should then be given to the proper account. For example: Suppose I take a sack of potatoes for home use. I charge living expense account with the then market value and credit potatoes and vegetable account for the same amount. In this way each account will get its proper credit.

ARTHUR W. BIGGERS.

Navarro, California.

A Good Combination.

Dairy Cows and Pigs.

ED. HOARD'S DAIRYMAN:—Pigs can be grown very profitably upon the dairy farm, and perhaps there is no better combination for actual profits, than these two—the cow and the pig.

Skim milk contains all the essential elements of growth in animals; the fat can be dispensed with entirely. It builds up the frame, rather than puts on fat, and this is exactly what is desired in the case of pigs.

You will notice that in speaking of this combination, mention is made of pigs, not hogs. It is the former that is the money-maker, for there is no profit in keeping such animal until it becomes a hog. To get best results we want to have our pigs ready for market at six to eight months of age. Kept much longer the profit begins to decrease. Quick growth should be secured, and the earlier the period when they are turned off, after they reach a certain point, the better. Let us consider this question of rapid growth, and see how to secure it.

In the first place we need good, healthy, thrifty stock to serve as breeders. The sows should be liberally fed during the period of gestation, but corn should not figure conspicuously in the ration. Rather let the animal receive plenty of succulent food, clover, roots, bran—that standby of all seasons for all kinds of stock—anything that will keep her in good condition, but not fat. Plenty of exercise is necessary, also, and fresh water to drink at will. Skim milk is an excellent food for the brood sow, and so, also, is buttermilk.

We ring our sows and turn them into the stubble fields after harvest. Some do not recommend this practice, but we have never had any injury done in following it, where the animals cannot root. Exercise and plenty of it, is what the sows need at this time. The pigs will be more apt to come with vigorous constitutions, ready to begin rapid growth from the very first.

After farrowing, little food should be given the dam until the pigs are twenty-four to forty-eight hours old. A pail of slop, half a bucket of skim milk, or a little bran will be sufficient. Water should be given. In cold weather take the chill off before offering it.

After a few days the ration may be gradually increased, until on full feed. If asked what amount this should be, I would reply, all the sow will eat up clean. If the pigs are to get a good start, the dam must be supplied with abundance of good nourishing food.

I know that some think dish water is about all a sow needs to keep herself and a litter of pigs on, but I take no stock in such methods. Give plenty of bran, ground oats or something similar, and sweet milk to drink. Avoid buttermilk for a sow that is suckling pigs. It may cause diarrhœa.

Young pigs need exercise or they will get too fat, where the dam is highly fed, and have "thumps." Spring farrowing is usually more liable to develop this disorder than fall; since, when the weather is cold, as in March or April, the little things stay closely in the nest, become over fat, and trouble ensues right away. I have never had any trouble of the kind, since following the rule of compelling the pigs to take exercise. Turn them out of the pen every fine day for a run in the barn yard, or other convenient place. Do this every day after they are a week old, and there will be no trouble with the "thumps."

So firm is the writer's belief in the advisability of starting the pigs to generous growth prior to weaning, that he has bought bran to be fed, to a neighbor's sow, whose pigs had been purchased to be delivered at ten weeks old. The pigs, of course, got their share of the bran, so it was eventually to my advantage to see that they had it.

After weaning, at ten weeks, the pigs must be pushed every day. Once a pig comes to a standstill, it is all up with it so far as profit goes. I would not take a stunted, pot bellied pig as a gift. They will eat, but they don't thrive when in this condition. To avoid it feed generously of bran, ground oats and sweet skim milk, all they will drink. Avoid corn as a steady diet; a young pig has no need of it, and it acts as a positive injury if fed to excess. If confined to one thing, choose bran for growing pigs. Give all they will eat up clean each time, but no more. Never allow food to collect in the troughs. Better let them get a little hungry from one meal to the next, so they will be ready to eat with a relish.

Keep every thing sweet about the food. Sour swill barrels are an abomination. A hog does not prefer to have its food different from other animals. Fresh water should be provided at all times.

Not until the pigs are at least four or five months old, should any attempt be made to fatten them. They will be fat all the way along, but do not begin feeding a corn ration until this time, then push them for all they are worth until they are marketed. They should weigh from 250 to 300 pounds alive. Skim milk is an important factor in the rapid growth of pigs; nothing can quite take its place. So fed it returns large profits per hundred pounds, and furnishes one of the best possible ways of disposing of this important by-product of the dairy.

An Experience with Lump Jaw.

ED. HOARD'S DAIRYMAN:—Having seen some inquires in your paper regarding Lumpy Jaw, I will give my experience with it.

In 1893 one cow shrank her milk from ten

Now

Is the time to subscribe for the volume for 1900 to take advantage of the special offer below:

The Youth's Companion

Issued Every Week.
$1.75 a Year.

FAMOUS soldiers and sailors, statesmen, scholars, travellers, hunters, and the most gifted writers of stories will enrich the pages of The Companion during 1900. Send your address on a postal card, and we will mail you our Illustrated Announcement Number, giving a full Prospectus of articles and authors already engaged for the 1900 Volume.

....FREE....

SEND $1.75 at once with this slip or mention this paper, and we will send you THE COMPANION FREE for the remaining weeks of 1899, and then for the 52 weeks of the year 1900.

The Companion Calendar for 1900, given also to all New Subscribers, lithographed in twelve colors, is the most beautiful one in the long series of exquisite Companion Calendars.

The NATIONAL Cream Separator

In buying a Separator you want the best. The *National* is the closest skimming and the lightest running Cream Separator in the world. Substantially built, readily cleaned, and easily managed. We will send you a *National* on **Ten Days' Trial**, and if it don't do just what we claim, ship it back at our expense. Try it in competition with any other make, and judge for yourself. Send for our free catalogue.

NATIONAL DAIRY MACHINE CO., Newark, N. J.

Second-Hand SEPARATORS

I have on hand a lot of cream separators in good order that I will sell cheap for cash. Second-hand Sharples Factory and Dairy Separators; also De Laval Standard, Alpha and Baby Separators of almost all sizes. Also second-hand separators of other makes. Write for prices and particulars.

P. O. BOX 56, WEST CHESTER, PA.

THE IDEAL MILK PAIL

Is the best, cheapest and most practical pail and strainer on the market. Write for circular and special price to

THE
National Specialty Co.,
RACINE, WIS.
Agents Wanted in every Co.

OUR INCUBATORS EQUAL THE BEST.

They have all the latest improvements and are sold at very low prices and GUARANTEED to please every customer. Send 6c. for our 148 page catalogue which contains full descriptions of our extensive line and tells how to raise poultry successfully. Send for it at once.

DES MOINES INC'B CO.
Box 424 Des Moines, Iowa.

GOLDOMETOR for locating gold, silver and other minerals. In a pocket case. Also Rods and Spanish Needles. Catalogue, 2 cent stamp. B. G. STAUFFER, Dept. H. D., Harrisburg, Pa.

Protect Your Feet From The Cold and Wet.

All Knit "BALL-BAND" WOOL BOOTS, are the best.

They are the most comfortable and will wear twice as long as others. "Ball-Band" Socks and Rubbers are the same high quality as the All-knit Boots. They have superior features not found in others. Be sure that the trade-mark "Ball-Band" is on every pair. There are more imitations and counterfeits this season than ever before. We make all our own rubbers and are not connected in any way with any Trust. Insist upon getting "Ball-Band" goods from your dealer and take no others said to be "As good as," etc. Mishawaka Woolen Mfg. Co., Mishawaka, Ind.

to five quarts before I discovered the lump, which was located on her flank, about the size of a large bowl, apparently soft and full of pus. I lanced it and it literally emptied itself out. After rinsing it out well with warm castile soap suds, using a common syringe, I inserted about ¼ ounce liniment called Cactus Oil.

That was the end of No 1. and would have ended it all if I had have buried the pus, but I had the lumpy jaw start on my cattle in about two or three months after, and we had a free fight for about three years.

During that time I lost two head and ruined the third. I read and experimented and tried patent remedies. Finally I cleaned my small herd with the same remedy I treated the first with. Allowing the lump to come to a head or soften, I opened it well, then cleaned it out with suds, and buried all pus, allowing none to escape. Cleanse the manger with boiling water, after the lump stops running, which will be in a day or two. I have, by this remedy, succeeded in cleaning the disease from my premises and have not been bothered with it for nearly two years. I cannot say whether it was the liniment or the cleansing that did the work, but it seems to me that any disinfectant and healing liniment would be good. If any of my brother dairymen wish to hear from me personally I will answer a letter from them with stamp enclosed as there may be some things that will bother a green hand the first case.

When I saw the letter from G. L. on page 116, I felt it my duty to write. But not long after I saw a letter from Mill Creek and I thought I *must* write, but to-night I saw the condition G. L. is in on page 701 and I have written (perhapes for the scrap pile) but I have discharged my duty. I do not want to speak light of Professor Horne for he, I think, gave the correct scientific answer.

I have taken interest in all good veterinary work for thirty years, having worked at horse shoeing for twenty-five until my health failed and now I have eight cows and forty acres of land all clear and am happy since I am rid of the lumpy jaw, and a subscriber to HOARD'S DAIRYMAN.

Outagamie Co., Wis. A. E. BURDICK.

Pennsylvania Pickings and Thoughtlets.

ED. HOARD'S DAIRYMAN:— Wheat seeding is about completed in our section of the state, and the acreage is larger than it was for some years. The price is low, sixty-six cents in our local market, so that is no incentive we should think, but it works this way. The majority of our farmers depended on wheat for their main cash crop for many years, but of late it has brought so little money that it was a difficult matter to make ends meet; thus it is that he increased the acreage, and is still increasing. Also to make more bushels to the acre (a very laudable ambition) he started sowing commercial fertilizers, and the quantity he now uses is immense. Ten years ago, a few carloads came to our little railroad station; now we get annually forty or more carloads, and our farmers pay for it upwards of $15,000. Some of this plant food is profitably and intelligently used, but a larger part of it is half or wholly wasted. Unwise rotation of crops and careless culture cannot be made profitable by a liberal use of plant food, costing five to fifteen cents per pound. Not enough stock is kept, and what is kept is often starved on plenty of timothy hay.

But I am glad to say that a better condition of things is dawning. The working and preaching of our dairy and agricultural press is bearing fruit. Clover is spoken of more kindly, and some even grow it. In many stables dairy cows are tolerated and even respected, where formerly only the square, blocky animal dared set foot.

Light is dawning. I had more inquiries concerning silos this fall than ever before, both personal and by mail. Ten times as many agricultural papers are taken at our post-office as were taken a decade ago.

BETTER AND MORE PRACTICAL AGRICULTURAL TEACHERS ARE AT WORK.
